We have a fair supply of Beasts to-day, but most of them of middling quality; the trade is about the same as on Monday: the best Scots, &c., are readily sold at from 3s 10d to 4s 2d, and Short-horns about 3s 10d—in some instances a little over; a good clearance is effected. We have not quite so many Sheep and Lambs, but the trade is very dull, and it is very difficult to support Monday's prices; the best Downs make no more than 4s, and Longwools nothing over 3s 10d, Ewes and second quality 3s 2d to 3s 6d. Veal-trade is still heavier, and the best Calves cannot be quoted at more than 4s. Lamb-trade is very bad; very few make 4s 4d. Pork remains steady.

Beasts, 752; Sheep and Lambs, 9760; Calves, 339; Pigs, 290.

41, West Smithfield.

COVENT GARDEN, Aug. 24.—In consequence of the steady state of the weather the market has been well supplied during the week with both fruits and vegetables, and generally speaking little alteration has taken place in the prices of most articles Trade is, however, far from being brisk. Pine-apples of good quality are plentiful, and Grapes are also quite sufficient for the demand. Peaches and Nectarines are abundantly supplied, as are also Plums of every kind; Greengages are exceedingly plentiful. Apricots are becoming scarcer. Of Apples and Pears there is abundance; but there is little demand for them. Melons are good and plentiful: Morello Cherries are selling at very nearly the same prices as last week. Gooseberries are nearly over; a few, however, may still be seen in the market. Currants are scarce. Filberts are becoming plentiful and are in consequence getting cheaper. Tomatoes are supplied, but not in large quantity; they are very good in quality. Among Vegetables, Cauliflowers are good and plentiful, as are also Cabbages. French Beans are sufficient for the demand, and a few Windsor Beans are also in the market. Onions are plentiful. Peas continue to get less abundant. Celery is tolerably good: it has not altered in price since our last report. We observed a few samples of Cape Broccoli in the market. Among Cut Flowers were Stephanotus floribundus, Euphorbia splendens, Bignonia venusta, Ceanothus azureus, Camellias, Heaths, Sweet Peas, Verbenas, Fuchsias, Scarlet Pelargoniums, Roses, Picotees and Carnations.

FRUITS.

Pine Apple, per lb., 4s to 6s
Grapes, Hothouse, p lb, 2s to 4s
— Spanish, per lb., 9d to 1s 6d

Garlic, per lb., 4d to 6d
Onions, per bunch, 2d to 6d
— large, per bushel, 1s to 3s
Shallots, per lb., 4d to 6d
Tomatoes, per half-sieve, 6s to 7s
Lettuce, per score, 6d to 1s 6d
Celery, per bunch, 1s to 1s 6d
Mushrooms, per pottle, 6d to 1s
Small Salads, per punnet, 2d to 3d
Watercress, p. 12 sm. bun. 3d to 6d
Parsley, per doz. bunches, 1s to 2s
Tarragon, Green, per bunch, 2d to 3d
Green Mint, per bunch, 2d to 3d
Marjoram, per bunch, 2d to 3d
Chervil, per punnet, 2d to 3d

HOPS, Friday, Aug. 23.

The Market is very firm, and Sussex Hops are sought after at 2s to 4s advance on last week's prices. Duty, 125,000*l.*

Pattenden & Smith, Hop-Factors.

MARK-LANE, Monday, Aug. 19.

Since Thursday the weather has become fine, and the accounts from the country are more favourable than could be expected—indeed it is the general opinion that much injury has not been sustained from the rain, and harvest is progressing rapidly. On Monday last there was some degree of life in the trade, which was increased on Wednesday, owing to the bad weather continuing. Foreign Wheat on Friday was sold at 2s to 3s. over Monday's prices. There were about 1000 qrs. of New Wheat up for to-day's Market, the quality of which was fine, and condition generally good. Old from 52s. to 58s. per qr. The trade for Old and Fore[illegible] was dull at about 1s. above the rates of this day se'nnight.—Barley meets a good demand, and fully maintains our quotations.—Beans are 2s. dearer.—White Peas unaltered in value, but Maple and Grey 1s. higher.—Oats are a difficult sale, and barely maintain the prices of last week.

Friday, Aug. 23.

The arrivals of English Wheat since Monday have been moderate, and prices remain nominally the same as on that day; the fineness of the weather, and disinclination on the part of the holders of Foreign to submit to any reduction in its value, causes the transactions to be of a limited character. The quantity of Wheat cleared in during the week at the 18s. duty was about 36,000 qrs.—Barley and Beans continue to meet a good inquiry, and the terms of Monday are in some instances rather exceeded.—In Peas there is no alteration.—The Oat-trade is very inactive, and late rates scarcely maintained.

A variety of upwards of 50 tea and coffee services may be seen in the show-rooms, where may be selected every article of silver requisite for the side-board or plate chest. Pamphlets of prices, illustrated with sketches of the various articles, gratis, and forwarded, postage free, to any part of the kingdom.—A. B. Savory and Sons, 14, Cornhill, London, opposite the Bank of England.

Bound in cloth, price 5*s*. 6*d*.

JOE MILLER'S JEST-BOOK. A Reprint from the first and genuine Edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation; but, that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiæ.

Extract from the Preface.

"Another strange circumstance connected with this work is, that everybody presumes that he himself and everybody else are perfectly familiar with its contents . . . and yet, if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published."

London: Whittaker and Co.

Now ready, price 4*s*. 6*d*.,

RURAL CHEMISTRY.

By Edward Solly, Esq., F.R.S.,

Experimental Chemist to the Horticultural Society of London, Hon. Mem. of the Royal Agricultural Society, and Lecturer on Chemistry, at the Royal Institution.

&c. &c. &c.

Extracts from the Introduction:—

"A knowledge of the chemical composition of soils and the various substances employed as manures enables us to comprehend the mode in which the latter act; and a knowledge of the nature of those substances which plants require, points out the best and most economical methods of restoring to the soil, by manures, those substances which plants remove from it."

"If the farmer knows what it is that gives the fertilizing powers to manure, and is aware of the nature of those substances, he will soon learn the best method of preserving and using them: he will then understand how to make the most of the various sources of manure at his disposal, and he will be enabled readily to save much, that, for the want of such knowledge, would otherwise be lost."

Glossology, by B. Ridge
Guide Books

Foreign Correspondence.—Letter from Venice: Account of Visit to the Palazzo Foscari

Original Papers.—Has Captain Warner a Secret?—Shakspeare's Characters: Benedict and Beatrice converted

Our Weekly Gossip.—Mehemet Ali and his resignation—Deaths of Earl Mountnorris and Mr. Drummond—Funeral of Dr. Dalton—Art Unions—Protection of Copyright—Report of the Decorative Art Commission—Thomas's Coins—Philharmonic Direction for 1845—Mr. Nixon's Statue of William the Fourth—Euler's MSS. at Dorpat—Louise-Philippe and the Consul at Hammerfest

Fine Arts.—Proposed alterations in Westminster Abbey—The Bachelor's Own Book, by George Cruikshank

Music.—Her Majesty's Theatre: Corrado d'Attamura.

Miscellanea.—Poland: the overflow of the Vistula—History of American Ice—Rising of the waters at Laach—Mr. Dempster's New Rig.

Order The Athenæum of any Bookseller or Newsman.

Price Sixpence, free by post Sevenpence.

The Lancet,

Of Saturday last, August 17, contains:—

LECTURES on the OPERATIONS of SURGERY and on DISEASES AND ACCIDENTS requiring OPERATIONS, by ROBERT LISTON, Esq.

Lecture VI.—The Nose—Enlargement of the Follicles—Encysted Tumour of the Alæ—Epistaxis—Congenital Deformities of the Face—Hare-lip—Fissure of the Palate

Clinical Contributions, by Geo. Ross, Esq., Camberwell.—The Urine in Dropsy

Selections from Essays on General Pathology, by James Bower Harrison, Esq.—No. II.: On the Division of Disease into certain Elementary Conditions

Scarification of the Gums during Dentition

Contributions to the Practice of Midwifery, by Dr. J. Hall Davis:—Protracted Labour—Death of the Patient

The Local Pathology of Neuralgia, by Dr. Ebenezer Skae

On the Comparative Value of Chemical and Pathological Data in Diseases of the Kidneys

FOREIGN DEPARTMENT—Académie de Médecine, Paris: Debate on the present Direction of Ophthalmalogical Science—Cases of Sus-pubic Lithotomy—Arsenic in the Earth of Cemeteries—Acute Glanders following a Bite by a Horse—Excision of the Spleen

REVIEWS—A Practical Treatise on Organic Disease of the Uterus, being the Prize Essay to which the Medical Society of London awarded the Fothergillian Gold Medal in 1841, by John C. W. Lever, M.D.

A Bill for the better Regulation of Medical Practice throughout the United Kingdom

Remarks on the New Medical Reform Bill

TWELFTH ANNIVERSARY MEETING of the PROVINCIAL MEDICAL and SURGICAL ASSOCIATION, held at NORTHAMPTON.—*First Day*: List of Members present—Report of the Council—Dr. Hastings' Address—Dr. Robertson's Address—Schools of Preliminary Education for the Sons of Medical Men—Essays on Mesmerism—The Retrospective Address on Surgery. *Second Day*: The Public Breakfast—Report of the Benevolent Fund—Retrospective Address on Medicine—The Dinner

Medical Protection Assembly

The late Election for Councillors at the College of Surgeons—The Case of Montague Gosset, Esq.

UNIVERSITY OF LONDON—First Examination for the Degree of Bachelor of Medicine, 1844

DARLEY'S SCIENTIFIC LIBRARY

FOR THE USE OF

SCHOOLS, PRIVATE STUDENTS, ARTISTS, AND MECHANICS.

It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics these little works will be particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind and brief for the memory; and the Elements of each Science are reduced not only to their simplest but to their shortest form.

I.

A New Edition (being the fifth) *is now ready*,

A SYSTEM OF POPULAR GEOMETRY;

Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading truths and great principles.

By GEORGE DARLEY, A.B.

Price 4s. 6d., cloth.

II.

New Edition (just published),

COMPANION TO THE POPULAR GEOMETRY;

In which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of life, with numerous Cuts.

By GEORGE DARLEY, A.B.

Price 4s. 6d., cloth.

III.

Third Edition,

A SYSTEM OF POPULAR ALGEBRA;

WITH

A Section on PROPORTIONS and PROGRESSIONS.

By GEORGE DARLEY, A.B.

Price 4s. 6d.

"For students who only seek this limited knowledge of these sciences, there are, perhaps, no treatises which can be read with more advantage than Darley's Popular Geometry and Algebra."—*Library of Useful Knowledge, article "Mechanics."*

IV.

Second Edition,

A SYSTEM OF POPULAR TRIGONOMETRY,

Both Plane and Spherical.

With POPULAR TREATISES on LOGARITHMS, and the Application of Algebra to Geometry.

By GEORGE DARLEY, A.B.

Price 3s. 6d., cloth.

V.

FAMILIAR ASTRONOMY.

By GEORGE DARLEY, A.B.

With Engravings.—12mo, 5s., cloth lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun.*

Just published, the Thirteenth Edition, price 2s. 6d.; free by post, 3s. 6d.,

THE SILENT FRIEND on NERVOUS DEBILITY, CONSTITUTIONAL WEAKNESS, &c. By R. and L. Perry and Co., Surgeons, London. Published by the Authors, and sold at their residence; also by Strange, 21, Paternoster-row; Noble, 109, Chancery-lane; Crocker, 1, Milford-lane, Strand; Ward, 103, Strand (opposite Exeter Hall; Gordon, 146, Leadenhall-st.; Purkiss, Compton-st., Soho; Wilson, 338, Oxford-st. (two doors from Argyll st.), London. The Cordial Balm of Syriacum is a stimulant and renovator in all Spasmodic complaints. Nervous Debility, Indigestion, Asthma, and Consumption, are gradually and imperceptibly removed by its use, and the whole system restored to a healthy state of organisation. Sold in bottles, price 11s. and 33s. Perry's Purifying Specific Pills have long been used as the most certain remedy for Scorbutic Complaints of every description, Eruptions of the Skin, Pimples on the Face, and other disagreeable affections, the result of an impure state of the blood. These Pills are perfectly free from mercury and other deleterious drugs, and may be taken with safety without interference with or loss of time from business, and can be relied upon in every instance. Sold in boxes, at 2s. 9d., 4s. 6d., and 11s., by all Medicine Venders.

Messrs. Perry and Co. may be consulted daily at their residence, 19, Berners-street, Oxford-street, from 11 till 2, and from 5 till 8. On Sunday, from 10 till 12.

HEATING BUILDINGS by HOT WATER.—A PRACTICAL TREATISE on WARMING BUILDINGS by HOT WATER; on Ventilation, and the various Methods of Distributing Artificial Heat, and their Effects on Animal and Vegetable Physiology. To which are added, an Inquiry into the Laws of Radiant and Conducted Heat, the Chemical Constitution of Coal, and the Combustion of Smoke. By Charles Hood, F.R.S., F.R.A.S., &c. Just published, Second Edition, greatly enlarged, with numerous woodcuts, &c., 8vo, price 10s. 6d. cloth.

Whittaker and Co., Ave Maria-lane, London; and to be had of any bookseller.

NEW EDITION OF COL. HAWKER ON SHOOTING.

Published this day, 8vo, 21s. cloth, the Ninth Edition of

INSTRUCTIONS to YOUNG SPORTSMEN, in all that relates to GUNS and SHOOTING. By Lieut.-Col. P. Hawker. Corrected, enlarged, and improved, with Eighty-five Plates and Woodcuts, by Adlard and Branston, from Drawings by C. Varley, Dickes, &c.

"The very best book we have on the subject."—*Blackwood.*

"Colonel Hawker expounds the whole *rationale* of shooting with clearness, fulness, and vivacity."—*Edinb. Rev.*

London: Longman, Brown, Green, and Longmans.

MR. HOARE'S NEW WORK ON THE VINE.

This day is Published, 12mo., 5s. cloth,

A DESCRIPTIVE ACCOUNT OF A NEW METHOD OF PLANTING AND MANAGING THE ROOTS OF GRAPE VINES. By Clement Hoare, Author of "A Treatise on the Cultivation of the Grape Vine on Open Walls."—London: Longman, Brown, Green, & Longmans.

TO NAVAL OFFICERS AND OTHER GENTLEMEN.

LECTURES at the ROYAL POLYTECHNIC INSTITUTION, by John Ryan, M.D. L.L.D., &c. A new course of instruction on "the Properties of Steam as applied to Naval Purposes," will commence on Monday next, 26th inst.

R. J. Longbottom, Secretary.

N.B. Practical instruction in Chemistry daily.

TERRA COTTA FIGURES, VASES, FOUNTAINS, &c. Manufactured by DOULTON and WATTS, Lambeth Pottery, High-street, Lambeth, London.

D. and W., from their experience as Potters, have made considerable improvements in the manufacture of Terra Cotta, the superiority of which over Artificial Stone or Cement is well known. It is subjected to a high degree of fire, which renders it imperishable, and gives it a sharpness and surface which no changes of temperature can impair.

D. and W. are enabled to offer the Terra Cotta at a considerable reduction in price; and Drawings and Designs will be forwarded Gratis, on application.—Architectural work executed.

DRESS AND FROCK COATS.—Superfine Cloth Dress Coats, 30s. to 35s.; Extra Quality, 40s. to 50s.; Frock Coats, with Silk facing, 35s. to 42s.; with Silk Velvet Collar and Silk facing, 50s.; Waterproof Chesterfield, Codrington, and Travelling Coats, 12s., 15s., and 21s.; Waistcoats, 5s. 6d. to 8s. 6d.; rich Satin, Silk and Cassimere, 8s. 6d. to 12s. 6d.; Trowsers, 6s. 6d. to 10s. 6d.; Doeskin and Kerseymere, 12s. 6d. to 21s.; Shooting Jackets, 10s. 6d., Boys' and Youths' Cloth, Hussar Suits, 21s. to 30s. A Suit of Superfine Black Cloth, 3l.; Extra Quality, 3l. 10s. to 4l. At Fisher & Co.'s, Tailors, 31, King William-street, City, ten doors from London-bridge.

PATENT COMPOSITE CANDLES.—These Candles burn without snuffing more brilliantly than the best Wax, and are cheaper in proportion to the light given than the commonest Tallow Candles. The Patentees respectfully beg all purchasers to ask in the shops simply for "PRICE'S PATENT CANDLES," as many imitators have adopted the term "Composite." They are sold by most of the respectable Dealers throughout the Kingdom, and are supplied wholesale to the Trade by Edward Price and Co., Belmont, Vauxhall, and by Palmer and Co., Sutton-street, Clerkenwell, London.

TO LADIES.

ROWLAND'S KALYDOR.—This Royally Patronised and universally adopted Specific is a balmy, odoriferous, creamy Liquid, composed chiefly of extracts from the most rare Flowers and Herbs of an Eastern Clime. Its discovery was no less singular (by a Lady of rank), than its effects have been felicitous, during the last thirty years. It is the mildest and most efficacious preparation ever known for dissipating Tan, Pimples, Freckles, Discolorations, and other Disfigurements of the Skin. The radiant bloom it imparts to the Cheek, and the softness and delicacy it induces on the Hands, Arms, and Neck, render it indispensable to every Toilet.

Gentlemen will find it peculiarly grateful after shaving, in allaying irritation of the skin, and in rendering it soft and smooth.

Price 4s. 6d. and 8s. 6d. per Bottle, duty included.

CAUTION.—The great demand for this article excites the cupidity of *unprincipled Shopkeepers*, who vend the most *spurious trash* as the "Genuine Kalydor:"—whereas the genuine article is prepared solely by A. ROWLAND and SON, and the amalgamation of its *costly exotic* materials renders abortive any attempt to discover its component parts—thus proving the imposition of all other articles bearing the title of "KALYDOR." The genuine article has the words "ROWLAND'S KALYDOR" on the Wrapper.

*** All others are FRAUDULENT COUNTERFEITS!!!

SATURDAY, AUGUST 24, 1844.

VICTORIA LIFE ASSURANCE COMPANY.—
Trustees.
Sir Jas. Duke, Ald., M.P., Chairman.
Benjamin Hawes, Esq., Deputy Chairman.
Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.

Advances made to assurers on real or undoubted personal security, for terms of years, re-payable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary.

WILLIAM RATRAY, Actuary and Secretary.

CROWN LIFE ASSURANCE COMPANY,
33, Bridge-street, Blackfriars, London.

Directors.—George H. Hooper, Esq., Chairman; Sir John Kirkland, Deputy-Chairman.

John Chapman, Esq.
Charles Chippindale, Esq.
James Colquhoun, Esq.
B. D. Colvin, Esq.
Rear-Adm. Dundas, C.B., M.P.
Thomas Harrison, Esq.
Jameson Hunter, Esq.
Lieut.-Col. Moody, R.E.
John Nelson, Esq.
Richard Norman, Esq.
Alexander Stewart, Esq.
William Whitmore, Esq.
William Wilson, Esq.

Auditors—J. H. Forbes, Esq.; Geo. Hankey, Esq.; Thomas Lawrence, Esq.

Physicians.—Dr. James Johnston, 8, Suffolk-place, Pall Mall East; Sir C. F. Forbes, M.D., K.C.H., 23, Argyll-street.

Surgeon.—Samuel Solly, Esq., F.R.S., 1, St. Helen's-place.

Standing Counsel.—Charles Ellis, Esq.

Solicitors.—Messrs. Hale, Boys, and Austen.

Bankers.—Bank of England. *Actuary.*—J. M. Rainbow, Esq.

THE ADVANTAGES OF THIS OFFICE, among others, are:

1. A participation septennially in two-thirds of the profits, which may be applied either in reduction of the Premium, or to augment the sum assured. The following Bonuses have been assigned to all Policies, of at least three years' standing, effected for the whole duration of Life:—First Division, in 1832—From 18*s.* to 2*l.* 12*s.* per cent. per annum on the sums assured, varying with the age, being equivalent, on the average, to 26½ per cent. on the Premiums paid. Second Division in 1839—From upwards of 1*l.* to upwards of 3*l.* per cent. per annum on the sums assured, or, on the average, 33 per cent. on the Premiums paid for the preceding seven years.

2. Premiums may be paid in a limited number of annual sums, instead of by annual payments for the whole of life; the Policy continuing to participate in Profits after the payment of such Premiums has ceased.

3. The Assurance or Premium Fund is not subject to any charge for Interest to Proprietors.

4. Permission to pass to Continental Ports between Brest and the Elbe inclusive.

5. Parties (including Officers of the Army, Navy, East India Company, and Merchant Service), may be assured to reside in or proceed to all parts of the world, at Premiums calculated on real data.

6. Claims to be paid within three months.

7. The Assured may dispose of their Policies to the Company.

8. No charge but for Policy Stamps.

The Prospectus, Tables of Rates, &c. to be had at the Office in London, or of the Company's Agents.

T. G. CONYERS, Secretary.

News of the Week.

THE details of the bombardment of Tangiers, and of the events by which it was preceded and followed, will probably be considered by the great bulk of English readers to be less interesting than the professional criticisms of our naval officers, who witnessed the manœuvres of the French squadron. The official accounts of the bombardment state that the answer of the Emperor was too vague and full of restrictions to be satisfactory, and that the Prince de Joinville accordingly opened his fire on the 6th inst., and after a cannonading of nearly three hours, succeeded in silencing the batteries. The French made no attempt to land, but proceeded immediately to Cadiz to repair damages prior to a second demonstration on a more extensive scale, on the harbour of Mogadore. The French ships fired 9000 balls and bombs, besides Congreve rockets, but the greater number of shots fell short, or had no other effect than to break down the crumbling walls of the fortifications. Very few guns were dismounted, and the Moorish flag was never struck, but continued flying on the forts when the French squadron left the harbour. The affair was witnessed by men-of-war belonging to no less than seven different nations, and the reports from our own officers assure us that, in spite of all that has been done of late years to raise France as a naval power, the manœuvres of the Prince de Joinville at Tangiers show that there is still a vast disparity in every branch of naval efficiency between the French and ourselves. The French squadron has probably before this commenced the bombardment of Mogadore, and in a few days we shall no doubt learn the effect which these hostilities have had on the questions at issue between the contending parties. It is clear, however, that some circumstances occurred in reference to the affair of Tangiers, which are not explained by the brief official summary of the despatches published by the French Government. It appears that the Prince de Joinville had assured the British Admiral that everything wore a peaceful aspect; and that, although our Consul-general had undertaken the duty of mediator at great personal risk, the Prince did not wait for his return with the answer of the Emperor, but opened his fire while Mr. Hay was within 15 miles of the city, bearing the important tidings that the Emperor had actually conceded every point demanded both by France and Spain. The Tahiti question continues to be the subject of angry discussion, but nothing definite is yet known; and the speculations of the Paris papers on the subject have lost the interest of novelty.—From Portugal we learn that matters are daily becoming worse; the Minister has issued a decree which virtually gives him the legislative attributes of the Cortes, and suspends, if it does not abrogate, the constitutional Charter. The Duke de Palmella, and other statesmen, have appealed to the Queen against these encroachments, and it is not improbable that the Cortes will interfere.—From Egypt we have some further details of the late proceedings of Mehemet Ali, but they throw no certain light upon his purpose, and indeed are contradictory in their statements of the reasons which are supposed to have led to his departure from Alexandria. Some accounts attribute his movements to a sudden fit of insanity, while others, with more probability, suggest that he had received intelligence of an intrigue against him in his own family, and that he had determined to take them by surprise. Whatever may be the cause, it is important to know by the last advices that Ibrahim Pacha had not assumed the Government, and that the country was perfectly tranquil.

Home News.

COURT.—Her Majesty and the infant Prince are now sufficiently well to be enabled to dispense with the further attendance of Dr. Locock, who took his leave of the Queen on Tuesday, and left the Castle for a tour on the Continent. The Prince of Wales and the Princesses are also quite well, and have taken their usual airings during the week. Saturday being the birthday of the Duchess of Kent, when Her Royal Highness completed her 58th year, Prince Albert, the Duke of Cambridge, and other members of the Royal Family, paid visits of congratulation to Her Royal Highness. On Monday Prince Albert inspected the Scots Fusilier Guards in the Great Park, and afterwards fished in Virginia Water. On Tuesday His Royal Highness went out deer-shooting in the Park; on Wednesday again inspected the Fusilier Guards; and on Thursday went out rabbit-shooting in the royal preserves. Lieut.-Col. Wylde has succeeded Lieut.-Col. Bouverie as Equerry in waiting on Prince Albert. The Duke and Duchess of Cambridge, and the Hereditary Grand Duke of Mecklenburgh Strelitz, left town on Monday on a visit to the Earl and Countess of Shrewsbury at Alton Towers, where they remained until Wednesday, and then returned to Kew. The anniversary of Prince Albert's birthday, on Monday next, on which day His Royal Highness will enter upon his 26th year, will be celebrated at the Castle with the usual honours. A display of fireworks will take place on the eastern terrace, directly opposite to the private apartments. His Royal Highness will be serenaded, at an early hour in the morning, by the band of his regiment, the Scots Fusilier Guards. A public dinner will take place the same evening, in honour of the event, at the Royal Adelaide Hotel. The venison for the occasion will be presented by the Prince.

THE PRINCE OF PRUSSIA.—His Royal Highness on Friday embarked in one of the Watermen's steamers, and went down the river to Greenwich, visiting on his return the Thames Tunnel, the London Docks, the Bank of England, and the Tower. The Prince then visited the British Museum, prior to his return to Carlton Terrace, where Chevalier Bunsen gave a grand entertainment in honour of his Royal Highness. On Saturday the Prince visited Woolwich, and accompanied by the Duke of Wellington, reviewed the Royal Horse Artillery, inspected the Military Academy, the Repository, and the Arsenal. In the evening he dined with the Duke of Wellington, and afterwards visited the Opera. On Sunday morning, accompanied by the Duke of Cambridge, the Prince visited the Wellington Barracks, and afterwards attended divine service in Westminster Abbey. In the afternoon the Prince visited the Queen Dowager at Bushy Park, and dined with the Duke and Duchess of Cambridge, at Kew. On Monday the Prince and the Duke of Wellington left town by an early train on the South Western Railway for Portsmouth, where they were received with the usual honours. His Royal Highness and the Duke visited the Dockyard, the Victualling-yard, the Block Machinery, the Collingwood line-of-battle ship lying at Spithead, and the Victory, Lord Nelson's flag-ship at Trafalgar. During the *dejeûner* a discussion arose among some of the suite, as to whether it would be possible to accomplish all that had been laid down, and leave Gosport at the hour appointed (five o'clock.) It was thought impossible, and some gentleman of the Royal suite suggested omitting the proposed visit to the Victory; but the moment the fact of such intention came to the Prince's knowledge, he definitively settled the question, by observing that he would much rather omit his lunch altogether than his visit to Nelson's ship. "In fact," added his Royal Highness, addressing one of the company in French, "I consider my visit to Portsmouth a sort of pilgrimage to Nelson's ship, and I cannot deny myself the pleasure of visiting it." On leaving the Victory, the Prince inspected the Royal steam yacht, and soon afterwards took his departure with the Duke of Wellington for Basingstoke, whence they proceeded to his Grace's seat, Strathfieldsaye, where a select party had been invited to meet the Prince. On Tuesday, His Royal Highness and the Duke left for Oxford, and proceeded to the residence of the Vice-Chancellor at St. John's College. His Royal Highness, on his arrival, put on the robes of a D.C.L., that degree having been conferred upon him by the University in 1814. At the Schools, the Duke of Wellington, as Chancellor, presented to the Prince an address of congratulation on his arrival at Oxford, which was acknowledged in English. The Prince then visited the different halls and colleges, the Bodleian, Dr. Buckland's Museum, &c., and then partook of a *dejeûner* in the hall of St. John's. The Royal party then proceeded to Nuneham, the seat of the Archbishop of York, where they passed the night, a distinguished party having been invited to meet them. On Wednesday the Duke of Wellington returned to town. His Royal Highness left Nuneham for Stowe, the seat of the Duke of Buckingham, and after partaking of lunch, inspected the mansion and grounds. The Prince was greatly pleased with this beautiful seat, and the Royal party devoted nearly three hours to an examination of its attractions. At six o'clock the Prince left Stowe for the Wolverton station on the London and Birmingham Railway, *en route* for Derby, where it had been arranged His Royal Highness should pass the night at the Midland Counties Hotel. On Thursday His Royal Highness rose at nearly daybreak, and after partaking of an early breakfast left Derby at six o'clock for Chesterfield. His Royal Highness made no stay in the town, but proceeded at once to view the princely domains of the Duke of Devonshire, at Chatsworth. His Grace is at present sojourning at Bolton Abbey, but he had ordered preparations on an extended scale to be made for the reception of the illustrious tourist; and, accordingly, when the Prince arrived at Chatsworth, he found a *dejeûner* prepared for him, and Mr. Paxton, the Duke's head-gardener, with a train of attendants, ready to accompany the Prince and his suite over the grounds. His Royal Highness repeatedly burst out into exclamations of astonishment and admiration at the varied forms and extent of the stupendous undertakings piled around him in such magnificent profusion, and complimented Mr. Paxton in the most flattering terms for the taste and ingenuity which he had displayed in laying out the ground. On leaving Chatsworth, the Prince proceeded direct to York on his way to Edinburgh and Glasgow. His Royal Highness has received pressing invitations from the Marquis of Londonderry, and the Earl of Shrewsbury, who is at present entertaining at Alton Towers a distinguished circle of friends, including several members of the Royal Family. The necessity, however, of His Royal Highness's early return to Prussia compels him to travel day and night in order that he may accomplish his projected tour within the limited period which is yet remaining for his sojourn in this country.

Foreign.

FRANCE.—The French Government on Friday received news from Tangiers of the 7th inst., respecting the facts announced by the telegraphic despatch given in the *Débats* of Thursday, and in our Paper of last Saturday. From this it appears that on the 4th the answer arrived which the Pasha of Larache had made to the *ultimatum* of France. That reply was not satisfactory. It said nothing of the intended dissolution of the bodies of troops collected on the frontier of Algeria, the numbers of which would be augmented by the arrival of the hereditary Prince with 20,000 or 25,000 men. The answer renewed the promise that exemplary punishment should be inflicted on the Moorish chiefs guilty of the aggression upon the frontier, but making it a condition that Marshal Bugeaud should be recalled. In fine, the part of the letter relative to Abd-el-Kader appeared more satisfactory than what had hitherto been obtained, but the style of it was vague, obscure, embarrassed, and full of restrictions. The Prince de Joinville and M. de Nyon, French Chargé d'Affaires, did not regard the reply as acceptable, as it appeared to have no object but to gain time. His Royal Highness therefore determined to attack the fortifications of Tangiers. The following facts appear to result from the official report addressed to the Minister of the Navy:—"It was on the 6th, about half-past 8, A.M., that the squadron under the command of the Prince, at anchor under the walls of Tangiers, opened its fire with shouts of 'Vive le Roi.' In one hour the fire of the place was silenced, the batteries were dismantled and the guns dismounted. On the side of the French the loss was not considerable. Notwithstanding the difficulty of the ground, the squadron came up and took its station with complete success. The Suffren, in which the Prince was, anchored in six fathoms and a half, in a rocky bottom, at the nearest point to the enemy's batteries, which the Admiral had reserved for himself. The fire ceased entirely at about 11 o'clock. It was kept up the whole while with an ardour which did not for a moment exclude the composure and precision required for correct pointing. It is to that correctness, as well as to the station selected by the Prince, that the rapid success obtained is to be attributed. The example set by the Suffren was followed by all the ships of the squadron. The resistance was much more vigorous than was generally expected; several cannon on the ramparts ceased their fire only after having been shattered. Mr. Hay arrived during the engagement in the Vesuvius from Mogador. In the evening he waited on the Prince de Joinville, and had a conference with him. The Spanish division, an English ship of the line and a frigate, several Sardinian, Swedish, and American vessels of war were present at this brilliant achievement. According to the preparations made on the 7th, the squadron would be able to put to sea on the following

day." The above accounts from the French official papers offer a singular contrast to subsequent advices from naval officers and others on board the English ships of war which witnessed the bombardment. All these accounts concur in stating that the exhibition of seamanship and gunnery by the French squadron was the source of great amusement to our own sailors, and it is manifest that the Prince had no very easy task to perform with so many professional eyes watching his manœuvres. One of these letters published by the *Times*, from an officer of H.M.S. Warspite, states that the first blunder of the day was committed by the Prince himself, who had his ships towed into action in such a manner, that had the Moors not been more polite than politic, would have exposed the ships to a destructive raking fire. The Moors, however, allowed his Royal Highness to anchor in any position he might choose, where, it must be evident to most people, he had not much to do in silencing forts which were soon deserted by their defenders. The writer also mentions as proof of the total deficiency of the French in naval gunnery, that the Triton, of 82 guns, was sent to silence a fort which was abandoned by the Moors before the ship got abreast of it. No resistance therefore was offered, yet the French persisted in firing for two hours, and then after resting half an hour discharged two rounds of shot at the fort and moved off in tow of a steamer. On the smoke clearing away our officers were astonished to find that with all this firing very little injury was done. The embrasures indeed were hardly touched; perhaps not more than six shots left any impression, notwithstanding the ship lay not more than three quarters of a mile distant! The writer then says:—

"The second instance presented to observation, illustrating the same inefficiency with respect to gunnery, was exemplified by the Belle Poule, a heavy new 60-gun frigate. About 1 p.m., the Belle Poule was ordered to weigh and proceed immediately to silence a round fort, on the eastern side of the bay, right opposite the town. The frigate forthwith proceeded on the service assigned her, and a more miserable attempt or a more contemptible failure perhaps was never witnessed, and does not cease to call forth the ridicule and jeers of all who were spectators of the transaction. As the Belle Poule approached her station towards the fort its defenders fired by way of challenge several distant shots; these, from their distant range, gave undeniable evidence of the heavy calibre of the guns, and induced the Frenchman to shorten sail very soon, and creeping up timidly, drop anchor at such a distant position that the guns of the frigate could not reach the beach, much less prove effective against the object of assault. However, the Frenchman resolutely fired irregular rounds of shot in the direction of the fort for full two hours, but with as much effect as though aimed at the rock of Gibraltar! After this achievement a steamer took the frigate in tow; but the fort, in scornful defiance, gave her the last and farewell shot! In the instance just stated, the Moors stood by their guns to the last, and the sole reason that the French frigate escaped a most severe chastisement is entirely attributable to the want of gunnery science on the part of the Moors, for the fort was armed with ordnance of formidable character, and undoubtedly would, if properly directed, have committed terrible execution, for the shot frequently passed right over the Belle Poule."

The writer goes on to express the surprise of the English squadron that the French did not land and take possession of the works after silencing these non-effective batteries; and in conclusion he adds that

"There was one circumstance in this transaction which affords, and did in a most striking manner give, the most unqualified satisfaction to the whole British squadron present at it, namely, the conspicuous deficiency of the French marine in their gunnery. Yesterday, in every point did the French clearly and indubitably prove themselves totally insufficient to cope with the British navy. This fact ought to be made known, nor can it be too widely circulated in England—the evident and vast disparity in every branch of naval efficiency between the French and ourselves. Before the events of yesterday, there was certainly not an officer on board this ship, perhaps not a man, but would have given our rivals credit and character for far more professional ability than they themselves displayed. Nor would there have existed any doubt in the least as to the French having requisite courage. But now it is said of them that, in this affair before Tangier, they undertook and attempted more than they had ability or dared to perform. Facts as they occurred have been simply laid down. Nothing is here stated but that which is believed to be substantially correct. Therefore, if any inference may be deduced from the foregoing, it must strongly demonstrate that the above opinion is not grounded upon any oblique sentiments of national jealousy or caprice, but is founded upon the evidence of plain unextenuated facts."

Another officer writes still more strongly; he says without scruple, that the French war-steamers went "rather a cowardly way to work, for though all were under weigh, they took up a position outside the ships that were remaining neutral." He says that the French

"Have not much to boast of, as their firing and manœuvring were far from good; and, considering there was a man-of-war from all nations looking on, it will not speak well for their good gunnery order. I myself am delighted to have had the chance of seeing a French squadron under fire, and for the future shall look on the boasting journals of France with a laugh on my face. I must say one thing more, though I am not a boaster, but one regiment from Gibraltar, and a hundred artillerymen manning these forts, would have sent Joinville and his crew to Davy Jones's locker."

Another officer says—

"It is now two hours since the firing began, the Frenchmen keeping up a continued blaze, and for one hour not a shot has been fired by the Moors. They have all the time been firing from, I should think, a dozen guns, and no more. The place is becoming a mass of ruins, so far as we can see, but it is nothing more than exercise for their men; they may have lost two or three men, but certainly not more, and not a rope or spar has been shot away in any of them. A steamer has just passed us, and she has one shothole just above the water line, and two have struck her in the stern. She was hankering round a fort a long way off, and they served her with a shot. The "grand nation" have nothing to boast of; they took up the best positions with an overpowering force against a savage and barbarous people, whose only force lies in the madness of fanaticism. It is now 5 o'clock, and the French ships have hauled out of harm's way; I may say given it up,—not game to land. The town is very much knocked about. Such a display of lubberly conduct as the French have shown to-day is beyond belief; their steamers running foul of different ships—from bad management the line-of-battle ships presenting their bows and sterns to be raked, and their bad gunnery has made us laugh. Little do they know the feeling against them among our men; could they be let loose the Crapauds would rue this day! We despise them for their conduct to-day, in firing at a defenceless town, as much as we laugh at their lubberly way of going to work."

In reading these statements, of course we must make allowance for national feelings, although no misrepresentation can avail either party, since the whole affair was witnessed by vessels of war, under no less than 7 different flags—British, Spanish, Danish, Swedish, Sardinian, American, and Tunisian. The Suffren line-of-battle ship, bearing the Prince's flag, is said to have received 40 shot, the Belle Poule also received some trifling damage, but the loss of life was very small. On shore, notwithstanding all the French firing, the loss of lives is said not to have exceeded 2 killed at their guns. The damage was much less than supposed. In one battery of 6 brass guns, four remained quite untouched. The French fired 9000 balls and bombs, besides Congreve rockets. The houses had not suffered much; but one or two belonging to Europeans, which had been deserted, had been entered by the Moors, among others that of the Portuguese consul; but, owing to the zeal and good management of the authorities, comparatively little injury was sustained. The Moors kept their flag flying till the last; and as soon as the French ships left their anchorage, they began to repair their fortifications, so as to be better able to resist another attack. The Prince set sail on the 8th for Cadiz to make good his damages, previous to proceeding to Mogadore, where it is said he intends to make a more signal demonstration. In reference to these events, it is necessary to state that the bombardment of Tangiers, was not only unexpected by our own admiral at Gibraltar, and by Mr. Hay, our Consul-General, but the Prince had so far assured them that everything wore a pacific aspect, that Sir E. Owen sent despatches to the Admiralty to that effect. It appears also, that the Emperor at his interview with Mr. Hay, as the mediator on the part of England, actually conceded every point demanded, both by France and Spain, but although Mr. Hay's return with the Emperor's answer was hourly expected, the Prince did not wait for his arrival, but commenced firing when Mr. Hay was only distant 15 miles from Tangiers with news of the Emperor's concession. —The Tahiti affair continues to be the subject of much discussion, but no new light is thrown upon it by the journals, and nothing definite has been decided by the Government. The meeting held last week at Exeter Hall, is duly noticed in the journals. It supplies the theme of many an angry article against this country, and of many a violent paragraph against M. Guizot. —The *Moniteur* contains a Royal ordonnance, dated Neuilly, the 17th inst., whereby, "considering the acts of disobedience and disorder which have just taken place at the Ecole Polytechnique," that school is disbanded. This occurrence would be of some gravity if the Parisians were in a riotous mood, as that celebrated school has almost ever since the fall of Napoleon proved a focus of resistance or sedition. The chiefs, professors, and other persons employed about the establishment, retain their places and emoluments; and another ordinance will hereafter appear relative to the re-organisation of the school. Most of the newspapers take part with the young men in this quarrel with the authorities. It appears that they refused to submit to be examined by M. Duhamel, a gentleman every way fitted for the task, but who had been elected in contravention to the laws under which the school was instituted, and who, it is also suspected, would not be quite impartial in his examinations. It is said to be in reference to this affair that Admiral de Mackau was appointed by the King, on the 17th, Minister of War *ad interim*, in the absence of Marshal Soult, but on the next day the appointment was rescinded. Everything known relative to the subject suggests the belief that Government have been long anxious for an excuse for re-modelling this formidable institution; that they seized, if they did not actually create, this occasion; and that, finding Marshal Soult opposed to them, they took advantage of his absence to effect their favourite project.

Spain.—Letters from Madrid of the 12th inst. give the details of the events before Tangier, as published in the Spanish papers. The French fleet arrived at Cadiz on the 7th to repair what it had suffered in the bombardment. Some disturbance broke out in Madrid on the 15th, but it was not of a political nature, and was easily put down.—The Barcelona prints of the 13th state that, on the day before, the Queen and her mother and sister left for Tarragona, whence they were to proceed by land to Valencia. At the same time, the English and Belgian Ministers quitted Barcelona in the Lavoisier steamer.

Portugal.—Accounts from Lisbon of the 14th state that a series of illegal acts on the part of the government prepared the way for the promulgation of an ordonnance on the 9th inst., signed by the Queen, and countersigned by the Ministers, wherein the Government arrogates to itself the authority of transferring the different Judges of the realm, and of changing the order of the different courts, and of dismissing those Judges who, within a certain period, shall not be ready to enter the new offices assigned them, &c. This decree is in open violation of the Constitutional Charter and ancient law of the realm, which declares that all legislation to the contrary is revoked. This act of absolutism has caused no small sensation in Lisbon, and all are up in arms against so unexpected and arbitrary a measure. The Duke of Palmella, who has evinced all along the strongest feeling in favour of the administration, went immediately to the Queen and made known to her Majesty the general feeling of dissatisfaction which prevailed, and protested against this illegal infringement. Another ex-Minister, the Viscount Sa da Bandeira, declared that "this decree, abrogating the Constitutional Charter, places the nation in a similar situation to that in which it stood in 1828, in consequence of the fundamental law of the state." Senor Cabral has thus openly, it would appear, assumed the legislative attributes of the Cortes—the power of making and revoking laws; and it remains to be seen whether the Queen will continue to sanction her Minister's assumption of the whole powers of the state in his person, or whether the representatives of the people may not assemble, or a serious disturbance ensue.

Belgium.—The small town of Chimay, where the remains of the celebrated historian Froissart are buried, having resolved to raise a monument to his memory, the King of the Belgians has granted 1200f. towards the cost. —We learn by the *Railway Chronicle*, that "the Belgian papers contain the announcements of cheap travelling to England, as if a trip to London were as usual a summer occupation with our continental neighbours as it used to be with our country neighbours at this season. We are informed that in Cologne, Aix, Herbesthal, Ostend, Antwerp, and Brussels, passengers may be booked through to London, at one fare, by single tickets! From Cologne to London they may be booked through for 3*l.* 10*s.* first class, and 2*l.* 7*s.* second class. To Aix-la-Chapelle the price is the same. There is also this additional advantage to travellers on this route, that if they wish to stop on the way, they may do so as often as they please; the ticket given lasts a month, a certain portion being cut off at each principal stopping place."

Germany.—The *Augsburgh Gazette* of the 15th announces the arrival of the King of Prussia at Vienna on the evening of the 11th. He alighted at the hotel of his Minister, the Baron de Canitz. His Majesty proceeded to Schoenbrunn on the following day, dressed in the uniform of the 10th Regiment of Hussars, which bears his name. Prince Metternich was expected at Vienna on the 13th inst.—Among the recent arrivals at Hamburgh from England was Viscount Cranbourne, eldest son of the Marquess of Salisbury, accompanied by his physician. This young nobleman is one of our greatest travellers, having visited nearly all parts of Europe; he is now *en route* to China, traversing the more remote parts of Russia on his way, and returning by the overland journey to England.

Italy.—A letter from Bologna of the 13th states, that 15 persons (merchants, proprietors, physicians, and lawyers) implicated in the revolt of 1843, but who had not formed part of the armed bands, had been removed to Rome, to be tried by the Sacra Consulta. Most of the young men in the Legations went into mourning on hearing of the fate of their brothers Bandiera and their companions.—Letters from Turin of the 10th state, that a few days before, the Duke of Genoa, second son of the King of Sardinia, while riding in the neighbourhood of his château of Raconige, was stopped by banditti. The Prince told them who he was, which, however, did not prevent the robbers carrying away his purse, watch, and some jewels. The Duke of Modena was taken suddenly ill, on the 5th, at his villa of Catayo.—A letter from Florence of the 3d states that the body of the ex-King of Spain (Joseph Bonaparte) was deposited on the 3d in the vaults of the church of Santa Cruz, the temple of honour of the great men of Italy. It had been exposed in state for eight days at his residence, simply covered with a black dress, and bearing the grand cordon of the Legion of Honour, and the chain of the Golden Fleece. He is said to have left 15,000,000f. to his widow and daughter, who is married to her cousin, Prince de Musignano, son of Lucien Bonaparte.

Greece.—Letters from Athens of the 31st ult. state that the elections were progressing but slowly, and that the opposition to the Ministry was becoming daily more formidable, particularly since M. Coletti, the chief of the Roumeliot military party, had openly declared against them. Gen. Grivas had been elected deputy for Acarnania, but the governor of the province, considering him under trial, declared his election invalid, and proclaimed the next candidate on the list duly elected. The harvest had been generally most abundant, and the vintage presented the most promising appearance.

Russia.—Accounts from St. Petersburg confirm the announcement of the death of the Grand Duchess Alexandra in childbed, on the 11th inst. The infant princess died on the same day. The Emperor and Empress, the Court, and the inhabitants of St. Petersburg, are deeply distressed at this event, the Grand Duchess being deservedly popular among all classes. Rain, violent south-west winds, and storms of hail, had prevailed at St. Petersburgh, with scarcely any interruption, and greatly impeded the harvest. A few days ago the environs of the city were visited by so furious a hail-storm, that the splendid furniture of the steamer which plies daily between St. Petersburgh and Peterhoff was dashed to pieces—the steamer compelled to stop, and the passengers with difficulty found refuge in the cabin. The hailstones were of the size of pigeons' eggs, and some even of hen's eggs.

Turkey.—By the Levant mail we have letters from Constantinople of the 27th ult., which state, that the cordiality which had hitherto prevailed between the English and French Ambassadors at the Ottoman Court was of late somewhat impaired, and that they warmly opposed one another on almost every question under negotiation. The Minister for Foreign Affairs had expressed to Baron de Bourqueney his sincere regret at the violence offered to the French envoy at Mous-oul, and assured him that he had given orders to the governor for the prompt and exemplary chastisement of its authors. Sir S. Canning had, in the course of the preceding week, two long conferences with the Minister for

Foreign Affairs, which were said to relate to the affairs of Syria. The state of Jerusalem and Lebanon is described as peculiarly unsatisfactory, principally owing to the intrigues of French diplomatic agents, who are said to be stirring up the public to discontent. The Turkish fleet was off Beyrout, so that it is possible it is not true that the object was to go to Tunis, as asserted by the French papers. Some coiners have been arrested in Constantinople. They had been carrying on their work on an extensive scale for some time, in a garden near the great mosque of Solyman. Amongst these coiners are two French subjects, whom M. de Bourqueney has announced his determination to abandon entirely to the Porte for punishment. There is evidently a wide difference between the policy which the French lately professed at Tunis, and that which M. de Bourqueney now pursues at Constantinople.

Egypt.—We have accounts from Alexandria to the 27th ult. It appears that the abdication of the Pacha of Egypt was by no means certain. His Highness had suddenly left Alexandria in a very mysterious manner, and without his movements being exactly known even to the members of his family. It was immediately rumoured that he had abdicated, but Ibrahim Pacha pleaded ignorance of any such intention; and it was quite uncertain whether he had gone to Mecca, or lost his reason. The affair has, however, created great anxiety among the foreign consuls, who are taking precautions against whatever may happen, by sending to the coast of Syria for as many vessels of war as can be spared. Among the many rumours current, one states that the Pacha was inconsolable at the departure of his son, Hussein Bey, for France. Another states that it is most likely that Ibrahim Pacha is in the secret of all; that the Pacha has learnt what has been carried on by Abbas Pacha and Scheriff Pacha against him, through the means of his own daughter, the widow of Defterdar Bey, who had arrived, and been the means of opening his eyes to all the intriguing against him, and he may yet, after suddenly surprising them in Cairo and quelling any seditions that may break out, return to Alexandria. However, if any reverse should happen, this is a most critical moment for Egypt.

West Indies and South America.—The Dee steamer has arrived with despatches from Jamaica to the 24th ult., and from Demerara to the 19th. The papers are filled with comments on the recent alterations in the coffee and sugar duties. They state that "public feeling on the subject of the sugar and coffee duties is still intense," and that "the information received from the mother country tends to deepen the dissatisfaction which was previously felt, for gross injustice has been done the West Indians." It is added that they have been accustomed to regard the Tory party as their protectors, and that whilst they remained in office they fancied themselves secure from harm so far as the sugar and coffee duties were concerned. Yet they now have the mortification of seeing that they are to "perish by the hands of their friends." It appears, however, that in all parts of Jamaica vast improvements are taking place in cultivation. Every operation connected with the produce of the soil is being carried on more economically, and more effectually. On coffee plantations guano is being applied, and on sugar estates the preparation of the land, the planting and clearing of the canes, are effected in a manner which has never before been attempted. The 10,000 Coolies which Government has allowed to be transported from Calcutta and Madras, are to be sent one half to Demerara, and the remaining 5000 in equal proportions to Jamaica and Trinidad; these three colonies having given the requisite securities in regard to them. They are to leave the East Indies some time between October and March. In Jamaica rain has been abundant, and close cloudy weather was looked upon as the forerunner of more. Some cases of yellow fever had broken out, but not to any great extent.—From Barbadoes the accounts mention plenty of rain and good crops, the tranquillity of the island being only disturbed by local election contests.—In Guiana a severe thunder-storm, which took place upon the 15th of July, was looked upon as the breaking up of the rainy season, and a parching drought was anticipated. The heat had already begun to be excessive. There was no news stirring of British interest.—The Dominica papers inform us that the trials for the late riots in that island were still proceeding. The punishments were generally imprisonment, extending from three months to a year, with fines of greater or less amount.—From Hayti the intelligence is that Gurrier, the new President, had directed two of his Generals to proceed to Aux Cayes to see Acaou and induce him to lay down his arms. They had so far succeeded as to induce the latter to repair to Port-au-Prince with them, where an audience was given him by the President. Subsequently, however, he was arrested and imprisoned. What steps would be taken by his friends and adherents on the receipt of the news of this fact was doubtful. Information from Aux Cayes was therefore eagerly looked for. It was understood that the system of terror established in Cuba was vigorously kept up by the tyrant in command. The order for the exit of all free persons of colour kept the colony in a great ferment. Upwards of one hundred took their departure by the last steamer to Vera Cruz.—The Dictator of Buenos Ayres has issued a decree forbidding the Buenos Ayreans, either male or female, to wear any other mourning on the death of their friends than a narrow bracelet of black round the arm. Black dresses of all kinds are strictly prohibited. Another decree has been issued by Rosas, forbidding any one who is not a Roman Catholic to exercise the profession of a schoolmaster in the Argentine Republic. This decree will at once close several of the best schools in Buenos Ayres.

CITY.

Money Market, Friday. — Consols for account closed at 98⅞. Reduced Three per Cents. 99⅝. Three-and-half per Cent. Red. 102⅛; New Three-and-half, 101⅛; Exchequer Bills 74 75, pm.; Bank Stock, 199; India Stock, 281.

GAZETTE OF THE WEEK—BANKRUPTS—G. F. Gilm, Bedford-st., Covent Garden, carver—T. Roberts, Blackman-st., Southwark, linen-draper Edward Mark Good, Peckham and Dulwich, farmer—John Manniglier, Oxford-street, watch-maker—George Pust, Upper Thames-street, ale merchant—Edward Edwards, City-road, draper—William Fuller, the Cliffe, near Lewes, currier—William Britton, Borrowby, Yorkshire, linen cloth manufacturer—J. Greig, Birmingham, blacksmith—T. Cook, Acton-street, Gray's Inn-road, silver-cutter—E. Peters, Gudstone, Surrey, brewer—R. Bressley, Wells street, Oxford-street, wine cooper—G. and W. Noel, Jermyn-street, Westminster, boot-makers—T. and R. Barrs, Worcester, tobacco-manufacturers.

SCOTCH SEQUESTRATIONS.—J. Hamilton, Neilston, victualler—D. Ogilvie, Blairgowrie, inkeeper—A. Taylor, Glasgow, grocer.

Metropolis and its Vicinity.

Capt. Warner's Discovery.—Capt. Warner has addressed another letter to the daily papers, in which he refers to the question at issue between himself and Sir C. Napier, who spoke disparagingly of the invention in the late debate in the House of Commons. We have no room for the whole letter, but the following extract contains its most important portions:—"What really passed between Sir C. Napier and myself upon the occasion to which he refers is as follows; and I beg to prefix to my report that I am in a condition to confirm it substantially by two witnesses. Sir C. Napier observed, that the constant complaint against me was, that I would never come to the point, but always receded from any tangible proposition. I asked Sir Charles to make some proposal; and he made the following:—the Government to furnish a line-of-battle ship and anchor her at the back of the Goodwin-sands, out of the ship track, which I was to destroy by a projectile from a distance of five miles. I expressed my readiness to accept this offer if Government would guarantee me 300,000*l.* if I accomplished the deed. Sir Charles exclaimed that if he could do as much he would have 3,000,000*l.*, and that I should be a great fool if I acted without a guarantee, for I should certainly be robbed if I did, as all inventors had been before me. I said 300,000*l.* would satisfy myself. The above proposition was put into writing, signed by myself, and emphatically pronounced by Sir Charles to be 'something like business.' This proposition was carried by Sir Charles to Sir R. Peel, who referred him to Sir G. Cockburn, who, as usual, threw cold water upon it, and expressed, according to Sir C. Napier's report to myself, something very much like an intention of keeping me in the background; an intention which I hope, by the powerful aid of the press, to frustrate. Sir Charles stated in the House of Commons, in his usual fashion of playing first fiddle, that *he* had offered me a ship to be anchored off Southsea Castle, and that *he* had offered to insure me a handsome remuneration in the event of success, but that I had not accepted his offer. Not a word about the written offer carried to Sir R. Peel and Sir G. Cockburn. But I will here, in the face of the world—for what is published by the press of England is read by the whole world—and that there may be no further mistake, misunderstanding, or misapprehension about the matter, repeat the offer I instructed Sir C. Napier, in terms of his own dictation, to submit to Her Majesty's Government:—If the Government will anchor a line-of-battle ship at the back of the Goodwin Sands, out of the ship-track, so that no harm may happen to passing vessels, I will from on board another ship destroy her at a distance of five miles. I am willing to take on board the vessel in which I operate General Sir George Murray, Captain Lord Viscount Ingestre, R.N., Captain Dickinson, R.N., and Captain Henderson, R.N., who shall have every opportunity of inspecting my mode of operation, and satisfying themselves that on this occasion I use a projectile. The kind liberality of my friends enables me to exhibit this experiment without asking the Government for a shilling towards it. If I fail, I am to receive nothing but ridicule—of which I have received quite enough to satisfy any reasonable man already. But previously I require a guarantee from Her Majesty's Government for its purchase of my secret for 300,000*l.*, in the event of my destroying the ship and satisfying the four above-named officers of the feasibility and practicability of my plans. Lastly, I invite Sir Howard Douglas, Sir Byam Martin, Sir George Cockburn, Colonel Chalmer, R.A., and Commander Coffin, R.N., to attend in another vessel and watch the proceedings."

Statue of William IV.—Workmen are now employed in preparing the open space between King William-street and Gracechurch-street, for the foundation of the statue of his late Majesty William IV., which will be erected in the course of the ensuing month. The statue is 18 feet high, and the design is by Mr. Kelsey, surveyor to the Commissioners of Sewers, the task of sculpturing the figure having been entrusted to Mr. Nixon. The statue and pedestal, which will be 40 feet high, will from its position be seen from the Surrey side of the water, and will occupy the spot where formerly stood the Boar's Head Tavern, celebrated by Shakspeare. The figure of his Majesty is chiselled out of two immense blocks of granite, the largest weighing 30 tons and the smallest 15 tons. The likeness is said to be very good, and the King is represented dressed in an Admiral's uniform, over which is the robe of state.

Ecclesiastical Commission.—The following return from the Ecclesiastical Commissioners has been recently laid before the House of Lords by the Commissioners, in compliance with an order, on the motion of Lord Clanricarde, for a return of all sums in their hands not appropriated to any particular purpose:—"The Ecclesiastical Commissioners for England are unable, for the following reasons, to return any sums now under their control, as not appropriated to any particular purpose, in respect either of the episcopal fund or of the fund applicable to the augmentation of small livings.—1. The Episcopal Fund is formed by fixed contributions from the larger bishoprics, out of which fixed annual payments are made, in augmentation of the incomes of the smaller. An annual surplus of about 6000*l.*, which according to the calculation made at the date of the Episcopal Act in 1836, is estimated as likely to arise when the debtor and creditor sides of the account shall both be in full operation, by vacancies having occurred in all the paying and all the receiving sees, is liable to be varied in amount either by increase or diminution, upon septennial revision of the episcopal payments and receipts; the first of which revisions is now about to take place, upon new returns of income made this year. The contribution from larger sees already vacated having hitherto exceeded in amount the augmentations required for smaller sees, there has been and still is an annual surplus, amounting, at present, to about the same sum of 6000*l.* This surplus has, from time to time, been nearly exhausted in providing episcopal houses of residence; and the present actual balance consists of a sum in Exchequer-bills, and certain moneys due from one of the contributing bishops, amounting together to about 12,000*l.* But neither this balance, nor the existing surplus annual income, can be said to be unappropriated, because, by further vacancies among the receiving sees occurring before other contributing sees fall vacant, not only may the annual surplus at any time be absorbed, but the whole annual receipts may become insufficient to meet the increased claims thus arising upon the fund; and this contingency alone renders it impossible yet to consider any sum in hand as unappropriated. As to the common fund, applicable to the augmentation of poor livings, the circumstance of this being its primary object would, in the present condition of the church, prevent the commissioners from feeling themselves at liberty to return any sum as unappropriated, even had the whole revenues, prospectively placed at their disposal by the Cathedral Acts, become already available. But these revenues being dependent upon the falling in of cathedral preferments, &c., the annual income increases only gradually: and it has been the invariable policy of the commissioners to afford the greatest amount of relief in their power to the existing spiritual destitution, by pledging this growing income, in perpetuity, from time to time as it accrues. The extent to which this principle has been carried appears from the list of 562 benefices and churches already augmented by the commissioners, which has recently been printed; and it results from their having done so much that a necessity will arise in the current year for supplying the other demands upon the fund, including the augmentations of archdeaconries out of their stock; the remainder of which may be considered as pledged to meet benefactions towards providing houses of residence for the poor clergy. The commissioners are therefore also unable to return any unappropriated surplus in respect of this fund."

Metropolitan Antiquities.—A few days since, while some men were excavating the ground in Bread-street, south of Watling-street, they discovered a Roman pavement of bricks one inch square, which was several feet in length, and at a depth of eight feet from the surface. On Saturday some Roman pavement, of a similar character and parallel with the former, was dug up in Friday-street. It is supposed that this pavement extends under the houses from street to street. A few days ago a Roman sewer was met with at the bottom of Friday-street, adjoining Great Fish-street, the first that has been seen in London. It was at about eighteen feet below the surface, and composed of Kentish rags, bricks, and lime. The width of it was about two feet. Very extensive excavations have been made in this neighbourhood, for the formation of a sewer, in the course of which numerous Roman walls impeded the progress of the workmen. In the three adjoining thoroughfares of Little Trinity-lane, Huggins-lane, and Bread-street-hill, leading to Great Fish-street, were discovered massive walls, going north and south, with other walls intersecting them, some parallel with each other, at a distance apart only of about fourteen inches, the walls being between two and three feet thick. At the lower part of Little Trinity-lane, an immense quantity of bullocks' horns and animal bones were dug up; as also in Lambeth-hill, and in different parts Roman silver and copper coins, pottery, &c. From the circumstance of the extent and the number of walls this is supposed to have been the site of a Roman temple, dedicated to Jupiter.

Post-office Espionage.—The *Times* of Monday states that during the last few days disclosures of the most extraordinary character have been made in the letter-carrier's office of the General Post-office, from the discovery by the authorities of a most extensive collusion on the part of several letter-carriers employed in the delivery of letters in the western district of the metropolis, who, it appears, have been for some time in the habit of opening letters directed to noblemen, gentlemen, and others connected with the sporting world, with the view of disposing of such information for some pecuniary consideration, or betting themselves upon the strength of it. From what has already been ascertained, there can be no question that this practice has been carried on for a length of time, and that letters, both inward and outward, have been thus treated, and their contents copied,

the letter being afterwards duly delivered, or forwarded, as the case may be. It is also proved that bets to a large amount have been laid by several of the parties implicated, and as the inquiry progresses from day to day, other and more startling facts are brought to light, and additional revelations made, culpatory of other carriers and sub-sorters who have either directly or indirectly been engaged in the transaction. Rumour states, that the plot was thus discovered. Two letters, open, were found on Wednesday last upon the seat of a letter-carrier, directed to well-known sporting characters, but with which he had no business, as the parties did not live upon his district or walk. Upon being closely questioned he admitted that such letters had frequently come into his hands, and eventually he gave such information concerning the opening of the letters, the use made of their contents, and the parties connected with the affair, that six other letter-carriers and one sub-sorter were brought up for examination. Two or three of these men have been several years in the service, and all of them are persons of upwards of four years' official standing. The mode by which their object was accomplished was this:—The letter-carrier delivering letters upon a certain walk, who appeared to be the leading member of the clique, would obtain from one of his colleagues (of course by mistake, if discovered,) the correspondence of some celebrated member of the turf. The letter was then opened, it appears, by him or some one of the party who happened to possess the greatest facilities, and the opinions of the writer ascertained with reference to the qualities of the several racehorses, or the state of the odds upon a race. This being done, the letters were transferred to their proper districts, and eventually delivered; the value of such information to the letter carrier, either as a disposable article for a given sum to a low gambler, or as a ground for betting upon his own account, can be only estimated by those who are in the habit of paying for the accommodation. A rigid inquiry into the circumstances is instituted daily; and up to Saturday afternoon there were suspended, until the decision of the Postmaster-General upon the whole affair can be known, the letter-carrier who delivered the letters of Lord George Bentinck, the one who delivered those of Mr. Tattersall, besides four others employed to deliver those belonging to other sporting characters, and the sub-sorter who had connection in some way or other with the transaction.

The Tartar Chieftain.—A Tartar chieftain has excited some attention by exhibiting the usual exercises of the soldiers of his nation to the public in Hyde-park on Saturday, and again at Col. Fox's villa at Kensington on Monday to a select party. He is a good-looking man, apparently between 25 and 30 years of age, of an athletic frame, with considerable squareness of limb, but with no superfluous flesh. He stands about 5ft. 10 in height, and may weigh about 13 stone. He was dressed in a tight tunic of rose-coloured silk, wadded, and capable of resisting a hard blow; very loose trousers, drawn tightly round his legs just below the knee, and met by tight black boots almost resembling long gaiters. On his head was a sheepskin cap of black wool, similar to those worn by the Persians who were in the suite of the Persian ambassador when in this country a few years ago. He had moustachios on the upper lip. His arms consisted of a pair of pistols, which in the course of his performances he repeatedly discharged, and a pole about ten or a dozen feet long, which he used as a lance, throwing it with considerable force when galloping, and with so correct an aim, that had it not been for the quickness and agility of the gentleman who volunteered to be the object of his aim, and who was also on horseback, a broken head or a fractured bone would probably have been the result. We believe this part of his practice is what is called throwing the "djereed." The Tartar also displayed considerable skill in lifting this weapon from the ground without dismounting, but this he performed without putting his horse in motion, making him stand still whilst he recovered his weapon. He also threw himself off his horse whilst at the top of his speed, and vaulted again into the saddle with great ease. From some curious particulars of his life which have been published, it appears that he is the son of a Khan of Independent Tartary, and having joined the Circassians was captured by the Russians, and obliged to enter their service. He deserted however at Warsaw, and made his escape to the Prussian territory after many extraordinary adventures, during which his horse carried him gallantly through the perils which surrounded him. He has now come to England with the view of getting back to Constantinople and from thence to Tartary, and has been so warmly patronised by Lord Dudley Stuart and other influential persons, that a subscription to defray his expenses and journey to Constantinople, to the amount of 50*l.* has already been made. He has the greatest affection for his horse, a grey Arab, of great beauty, and has refused to part with it for any price. On being asked a few days ago by an officer of the Life Guards if he would sell the animal? he energetically laid his hand upon the scalp of his head, and said, "I would sooner cut this from my head, and make my horse eat it, hair and all, than sell her, my preserver!"

Victoria Park.—In the Sheriff's Court last week, 3985*l.* was awarded to the trustees of Sir George Duckett's estate for 21 acres of land, which has removed the chief obstacle that has for some time impeded the commencement of operations for the formation of the new park. There is another litigant holding out for a greater sum than has been offered by the Commissioners, but it is expected that his claim will be settled without going into court. The property alluded to joins what is called Sir G. Duckett's Canal, a very unfortunate speculation, being a short cut connecting the Regent's Canal with the River Lea navigation. It was expected by the trustees that this would have been purchased by the Commissioners as an ornamental water for the park, instead of merely constituting one of its boundaries. Bishop Bonner's Hall, which was the subject of much litigation and delay from its proprietors, the trustees of St. Thomas's Hospital, will be vacated at Michaelmas, when it will be immediately demolished. Some interesting discoveries are expected, as it was here where the notorious Bishop imprisoned and tortured the first Protestant martyrs. Although no operations have yet been commenced, the surveys for laying out plantations have been made, and as soon as these obstacles are removed, and the purchased land is restored by the tenants, who have been allowed to resume occupation until October, active operations will at once commence.

Trafalgar Square.—The fountains in this square are in a state of forwardness, and the engine house in Hemmings-row, at the rear of the National Gallery, has been surmounted by an iron tank, capable of holding about 30,000 gallons of water. To this building there is attached a tower, at the top of which another iron reservoir will be erected. The boring for water has made great progress, having been carried down to a depth of upwards of 200 feet, and a plentiful supply of water is now obtained, rising to about 80 feet below the surface. Another boring is also being made in the square, adjacent to the National Gallery, connected by a tunnel with the former, which is intended to convey the water. The water obtained from these wells is intended not only for the supply of the fountains, but for the Houses of Parliament, and the various Government offices in the vicinity, and will be applicable in case of fire.

New Royal Exchange.—In consideration of the long period during which the tenantry of this edifice have been out of their shops, the Gresham committee have determined to forego a quarter's rent, in order that they may have time to fit up their premises in a suitable manner. This act of favour, although very acceptable to the parties, falls short of the generosity of the founder, who, when Queen Elizabeth made her progress to the City, and caused the "Bourse" to be proclaimed "The Royal Exchange, and to be so called from thenceforth and not otherwise," allowed "the shoppe-keepers to have their shops rent-free that yeere."

College of Chemistry.—A prospectus has been issued for founding an establishment, the want of which, in this country, has been long felt by men of science, viz., an institution for the exclusive study and promotion of chemistry, theoretical and practical. From the days when the discoveries of Priestley and Lavoisier were promulgated to the present moment, when the results flowing from the researches of Liebig are occupying the attention of the scientific world, a conviction of the vast importance of chemistry, and of its connection with all wants of civilised beings that can be comprised within the scope of manufactures, agriculture, and medicine, has been gradually increasing. Considering the attention that has of late been directed towards chemistry, as applied to the useful arts, it is considered probable that the public will now regard with favour and interest some well-authenticated proposal for the establishment of a college in England, similar to that of Giessen in Hesse Darmstadt. A prospectus has accordingly been issued from which it appears that the undertaking has been at length begun. The prospectus contains the names, as a provisional council, of men amongst the most distinguished in the country, for rank, character, and scientific attainments. Such a council is auspicious of success, and we have much pleasure in giving publicity to a project calculated to confer so much benefit upon the public.

Mr. Dyce Sombre.—It is stated that Mr. Dyce Sombre, whose remarkable cause was only a few days back the subject of discussion in the Court of Chancery, has a second time effected his escape from the persons appointed to look after him. His first escape was at Liverpool, shortly after the decision of a jury that he was incapable of managing his affairs. He proceeded to France, from which he returned to dispute the validity of that decision by an appeal to the Lord Chancellor. As our readers are aware, Lord Lyndhurst gave judgment against the appeal. Since the arrival of Mr. Sombre in London, the precaution was taken of placing two or three men, either officers of the Court of Chancery, or policemen in plain clothes, to keep watch on his movements. These men lodged in the same house with him, and one of them was always seen to follow him when he went abroad. It appears that on Tuesday week Mr. Sombre left his lodgings in the Haymarket, followed, as usual, by one of these men, and proceeded in the direction of Piccadilly. Near, if not in, the Burlington Arcade, he contrived to give his attendant the slip, and has not since been heard of, although active measures have been taken to discover his retreat.

Bank of England.—A novel fraud has been practised upon the Bank of England by some parties as yet unknown. It seems that the sum for which the fraud had been committed is 1000*l.*, and the manner is described as follows:—About three weeks since a 500*l.* note was presented to one of the cashiers for payment in specie, being marked to all appearance in the usual way, and having the corner torn off. It was discovered afterwards that the note, although genuine, had been stolen, and the number stopped at the Bank, but that the delinquent himself imitated the red ink mark of the checker, and thus obtained payment. Two notes were got rid of in this manner, and the Clerk's Guarantee Fund at the Bank will, it is said, have to make good the amount.

Balloon Ascent.—On Monday night Mr. Hampton made an ascent in the "Monster balloon," from White Conduit House, and ascended to an altitude of about half a mile. The machine proceeded in an easterly direction, and after about 20 minutes' voyage, alighted in the parish of West Ham, Essex. The voyagers then had the balloon packed up, with which they arrived at White Conduit House about 11 o'clock.

Accidents.—On Sunday afternoon Mr. Edwin Landseer, the distinguished artist, whilst riding along Porchester-terrace, was thrown with great violence from his horse, in consequence of the animal suddenly stumbling. He fell on his head, which was severely cut and bruised. He was carried to a neighbouring house, where surgical assistance was speedily afforded him, after which he was conveyed to his own residence in St. John's-wood. He is still suffering from the accident, but we are happy to hear that no ill consequences are apprehended from it.

Richmond.—On Tuesday morning, shortly after two o'clock, a fire of a very serious character, which was not extinguished until a large amount of valuable property was destroyed, broke out in the Cricketers' Tavern, at Greenside, Richmond. The premises were three stories high, of about 60 feet deep, and were bounded on each side by private dwelling-houses. The tavern was totally consumed, with all its contents and stock in trade, and the five adjoining houses were either wholly destroyed or seriously damaged by the water. Most of the property was insured. Many of the inhabitants of the poorer class of houses in the vicinity have also sustained great injury, but no lives were lost.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending August 17th.—West Districts, 147; Northern, 161; Central, 177; Eastern, 223; Southern 224; Total, 932. Weekly average for the last five years, 946.

Provincial News.

Bury St. Edmund's.—Information has been sent to the metropolitan police, that Leach Borley, a convict, under sentence of transportation for life for arson at the late assizes, has effected his escape from custody whilst being conveyed from the Court to the prison at Bury St. Edmund's. A reward of 50*l.* has being offered for his apprehension.

Carlisle.—On Saturday afternoon a serious accident occurred to the passengers by the mail which runs between Whitehaven and Carlisle. It appears that, after the coach had entered Carlisle, the streets being crowded with people on market day, and the coach being laden with eight or nine passengers and luggage, the coachman was requested by the passengers to drive gently up the town. Regardless, however, of the warning, he commenced whipping the horses, and increasing their speed, and in turning the corner of the old building called the Mainguard, situated in the market-place, the coach came in contact with the buildings, and one side of it was dashed to pieces. Mr. Borrer, the surgeon of Brighton, was on the outside, on his way to spend the honeymoon among the lakes with his wife, who was an inside passenger. He was thrown off by the shock and his thigh so seriously fractured that although amputation was immediately performed, the unfortunate gentleman died on the next day. Several other outside passengers were much hurt, but those who were inside escaped with little injury.

Clifton.—"General Tom Thumb," who has recently been the object of so much curiosity in London, was taking a drive near this town on Sunday afternoon, in an open carriage, accompanied by his father, his guardian, and his preceptor, Mr. Sherman. The General and the latter were sitting on the driver's box, and on descending a steep hill the horse took fright, ran at the top of his speed, and dashed against a high stone wall with such force as to break his neck, and shiver the shafts and a portion of the carriage to atoms. The two inside gentlemen escaped with a few slight bruises. Mr. Sherman had seen the approaching danger, and held the General firmly in his arms, and the moment the concussion occurred he cleared the horse and wall, the latter nearly nine feet in height, and landed safely in the adjoining field, preserving his charge harmless!

Carnarvon.—The local papers state that a large section of Calvinistic Methodists, 1000 at least, from Carnarvonshire and Anglesey, are preparing to emigrate to the United States, with a view to forming a community on the banks of the Mississippi.

Durham.—The measures taken by the colliery proprietors have at length proved effectual, and the colliers' strike, which has now continued eighteen weeks, is, so far as the county of Durham is concerned, virtually at an end. The most extensive collieries on the Wear are those of Lord Durham's family, the Marquis of Londonderry, and the Hetton Company; and in all of these the men formerly employed have returned to their work, and the pits are now in full operation. On Tuesday, upwards of 100 Welshmen arrived, and as the old workmen found their situations were being rapidly filled up, and they were unable either to coerce or cajole the Welshmen, a regular scramble took place for the remaining situations. It is regretted that the pitmen are so late in returning to their employment, for the strike has occasioned the introduction of many men into mining pursuits who otherwise would never have dreamt of becoming pitmen. The same result is taking place at South Shields, Haswell, and, indeed, through the county generally; so that there will, no doubt, be speedily a full supply of north-country coal in the London market.

Guernsey.—General Napier, Governor of this island,

has made a kind of *amende* to the militia of the island in a speech delivered at a review called in honour of the birth of a Prince. The journals of the island had quoted Sir J. Graham's words in the House of Commons, expressly stating that troops were sent to the island in consequence of official information received from the Governor. General Napier says upon this point—"You have been told that I sent for the soldiers. That is another falsehood. I never did; I never knew that they were coming till they were in the harbour. In this manner have base falsehoods been circulated; and I am glad to be able at last to see you together, to remove them from your minds. Nor do I believe that you are my enemies, though I have been told so. But, whether you are or not, I am not your enemy."

Leicester.—The first consecration of a Roman Catholic Monastery which has occurred in England since the Reformation took place in this county on Tuesday. It appears that the first English monastery of Cistercians was founded at Waverley, in the county of Surrey, in 1129, and so rapid was the extension of the order in this country, that, as old chroniclers tell us, there were no less than 62 houses of these monks in England in the reign of Edward I., A.D. 1300. At the suppression of monastic institutions by Henry VIII. at the Reformation, a great number of Cistercian monks, who remained faithful to their vows, sought safety in voluntary exile, and monasteries were built for their reception by their continental brethren, where they might continue to practise the austerities of their order in security. Of late years, however, the Roman Catholic faith in this country has pushed itself in every direction, and created a sort of revival in its favour. Under these circumstances a party of English Cistercians from the monastery of La Trappe returned to their native soil, and settled eight or nine years ago at Charnwood Forest, in Leicestershire, where they founded the monastery of St. Bernard. The building of the monastery, which from various causes has occupied so long a period of time, is now completed, and consists of cloisters, chapter-house, refectory, dormitory, calefactory, guest-house, prior's lodgings, lavatory, kitchen offices, &c. The buildings are erected in the greatest severity of the lancet style, with massive walls and buttresses, long and narrow windows, high gables and roofs, with deeply-arched door-ways. Solemnity and simplicity are the characteristics of the monastery, and every portion of the architecture and fittings corresponds with the austerity of the order for whom it has been raised. The monastery is sheltered on the north side by a huge rock, on the summit of which it is intended to erect a calvary, the crosses and figures of which are to be of gigantic size, and be visible from an immense extent of surrounding country. The consecration of the monastery and church took place on Tuesday the 20th, being St. Bernard's-day. This being the first event of the kind in England since the Reformation, the attendance of Catholic bishops, priests, nobles, and gentry holding that faith was exceedingly numerous. The services commenced with a procession of monks and ecclesiastics, attended by the visitors and an immense concourse of spectators from all parts. They left the old temporary monastic buildings at ten o'clock, chanting appropriate psalms, and on reaching the new monastery the usual ceremonies were gone through, the office of consecration being performed by the Right Rev. Dr. Walsh, bishop of Cambysopolis; high mass by the Right Rev. Dr. Wiseman, bishop of Melipotamus, assisted by the Right Rev. Dr. Morris, bishop of Troy. A sermon was afterwards preached by Bishop Wiseman, and the day being spent in religious exercises, vespers were sung, and the proceedings closed by a sermon from Bishop Morris.

Liverpool.—The prisoner, John Kent, who had been remanded from last week on a charge of killing Capt. Halsey, has not been committed for trial as was expected, the jury at the Coroner's inquest having returned a verdict of Justifiable Homicide. He was however kept in custody, and was brought up for re-examination on Monday, and again remanded, in order that the American authorities in this country might decide whether they would consent to his release, or claim his surrender for the purpose of being tried for the manslaughter of an American citizen. The result of this remand was that the prisoner was set at liberty, the verdict of the coroner's jury being considered satisfactory.—Probably there is no place in the kingdom, not even excepting the metropolis, where a larger amount of money is in process of expenditure in the construction of public works than there is at this moment in Liverpool and Birkenhead. The Manchester *Guardian* states that in Liverpool there are the following works now in progress:—Assize Courts (corporation), cost 80,000*l.*; New Gaol (corporation), cost 100,000*l.*; Albert Dock and Warehouses (dock committee), 600,000*l.*; New North Dock Works, including land and junction with Leeds Canal (dock committee), 1,500,000*l.*; reservoirs, Greenlane, and corresponding works (highway commissioners), 50,000*l.*; Industrial Schools at Kirkdale (select vestry), 30,000*l.*; Gas Extension (New Gas Company), 140,000*l.*; Shaw-street Park (private shareholders), 2500*l.*; making a total of 2,500,000*l.* All this is independent of many other works, some in progress and others in contemplation, with prospects of almost immediate commencement. Amongst those in progress may be reckoned Prince's Park, now forming by Mr. R. V. Yates, at the south end of the town; the new Presbyterian Church in Myrtle-street; Female Orphan Asylum; Catholic Female Orphan Asylum; New Northern Hospital (towards which Mr. W. Brown recently contributed 1000*l.*); St. Martin's Schools; Catholic Magdalen Asylum at Much Woolton, and St. Mary's Catholic Church, in Edmund-street. Besides other works in contemplation are the Daily Courts, on the site of Islington market (now discontinued); the intended additional railway tunnel to the north end of the town, by the Liverpool and Manchester Company; an additional merchandise station for the Grand Junction Company; the enlargement of the Lime-street terminus; and some improvements on the Bridgewater property. These various works will probably absorb not less than another million. The magnitude of the works in progress at Birkenhead may be inferred from the following abstract, which is taken from the estimates:—New Market (commissioners), 20,000*l.*; Town-hall (commissioners), 10,000*l.*; Park (commissioners), 25,000*l.*; Docks in Wallasea Pool (commissioners, as trustees), 100,000*l.*; Dock Warehouses on the margin of Wallasea Pool (private company), 600,000*l.*; Tunnel from Monk's Ferry to Grange-lane (Chester and Birkenhead Railway), 20,000*l.*; making a total of 1,075,000*l.*; and further, a proposal has been made, which is now under the consideration of the Finance Committee of the Liverpool Corporation, to buy the freehold of all their Wallasea estate, and pay for it in ready money! Besides the works named as in progress, a cemetery and infirmary are contemplated, to which may be added a design for the erection of one or more churches. On the two former it is intended to expend about 15,000*l.*

Manchester.—A poor woman named Mullen was murdered in this town last week by a young man named Evans, who lodged in her house, and immediately absconded. The police, however, succeeded in tracing him to Liverpool, where he was apprehended. The jury at the inquest returned a verdict of wilful murder against him, and he has been committed for trial.

Maidenhead.—A destructive fire broke out in a range of stabling within the yard of the Great Western Railway station at this place, in the middle of the day on Tuesday, which it is strongly feared was not occasioned by accident. The flames when first discovered burst forth with inconceivable rapidity; and within less than half an hour the whole building, which was composed of wood covered with slate, was a heap of ruins. There were 12 horses in the stable at the time, eight of which were rescued after considerable difficulty, without sustaining any damage. Three, however, which resisted every effort to extricate them, were burnt almost to a cinder. The other was got out alive, but in so dreadful a state that it was necessary to kill it immediately. The stabling and horses were the property of Mr. Lovegrove, proprietor of the Bear Inn, who provides the omnibuses which convey passengers between the town and the station. It is stated that the stabling was only insured as late as Friday last, but that Mr. Lovegrove will nevertheless sustain a loss of upwards of 100*l.*

Nottingham.—A Roman Catholic cathedral on a larger and more magnificent scale than any built in England since the Reformation has been recently erected in this town, and will be opened on Wednesday, the 28th inst. A large number of the Roman Catholic gentry, including the Earl of Shrewsbury (who has been a principal contributor), Lords Arundel, Camoys, Dormer, Newburgh, and Southwell, the Hon. C. Clifford, the Hon. T. Stoner, Sir P. Mostyn, Sir E. Vavasour, &c., are expected to be present, and high mass will be performed by Dr. Wiseman. The architect is Mr. Pugin.

Portsmouth.—The Collingwood line-of-battle ship is still at Spithead, and is said to be under orders for the Pacific. Lieut. Peel, son of the Premier, will take his passage in her to join his ship, the Cormorant. Two returns have been published by the House of Commons, which are interesting to naval circles at this juncture. The first gives the amount of horse-power ordered for Her Majesty's steam-vessels between the 1st April, 1839, and the 31st August, 1841, as follows:—Number of vessels, 18; horse-power, 4496; tonnage, 16,581. The second states that the amount of horse-power, &c., between the 1st September, 1841, and the 1st July, 1844, was:—Number of vessels, 30; horse-power, 11,261; tonnage, 26,892. From these statistics it seems that in the first three years of the present Administration there has been an addition of 12 to the number of our war steamers, with a corresponding increase of more than 10,000 tons in their burden, as compared with the strength of the same department during the two last years of their predecessors—a period memorable for the isolation and the irritability of France, and the naval demonstrations in the East.—On Sunday afternoon Mr. Robert Owen, the Socialist, left London by railway for this port, from whence he proceeds to America on a visit to his family residing in New Harmony, Indiana. His friends and disciples assembled in St. James's Park in numbers amounting to some thousands, and accompanied him on his way as far as Vauxhall Bridge, where Mr. Owen bade them farewell.

Stafford.—On Saturday the extreme sentence of the law was carried into effect at the County Gaol on William Beards, who was convicted at the last assizes of the murder of Elizabeth Griffiths, at the village of Wednesbury, in March last. The culprit made a full confession of his crime, and acknowledged the justice of his sentence.

Stratford-upon-Avon.—The local papers state that, stimulated by the recent demonstration in honour of Robert Burns on the banks of the Doon, preparations have already been announced to celebrate, next year, on the 23d April, his birthday, the memory of Shakspere, at Stratford-on-Avon. The *Leamington Courier* contains an earnest appeal on this subject to the nobility and gentry of Warwickshire to commence in good season, and it is expected that they will receive the co-operation of the Shakspere Society of London. A committee in the metropolis to co-operate with that formed in Warwickshire is also talked of.

Sunderland.—Mr. Day, master of the brig Earl Vane, of this port, has been brought before the sitting magistrates, charged with having attempted to scuttle that vessel at sea. The vessel returned, after being out for about nine weeks, without reaching Archangel. Soon after her arrival an investigation took place by the committee of the assurance policies, when it was elicited that the cause why the vessel had returned was, that an attempt had been made by the master to scuttle her. A criminal charge having, therefore, been made against him, he was accordingly brought before the magistrates. The crew deposed to several conversations, in which the captain acknowledged the attempt. A disclosure of his ignorance was rather startling, and disgraceful to the commercial marine of this country. It appeared that on the preceding voyage, a coal voyage to London, he engaged the mate to teach him navigation, which tuition continued on this foreign voyage, the mate being paid by the master 5*s.* per month additional in consequence. This master, who was intrusted with the conduct of a voyage to Archangel, was utterly ignorant of the first four rules of arithmetic; he could scarcely write, and his letters showed he was unacquainted with orthography; and, although in the prime of life at the time of this occurrence he was only able to take the meridian altitude. The defence was, that the prisoner was labouring under temporary insanity at the time of the offence, but the magistrates determined to send the prisoner for trial at the assizes. Bail in the sum of 400*l.* was, however, taken for his appearance.

York.—The Town Council of this city met last week for the purpose of agreeing upon an address of congratulation to Her Majesty on the birth of another Prince. Alderman Hudson, in seconding the address, "heartily hoped that the Prince now given birth to would be a Duke of York. It was not for them, however, to go further than to express a hope on that subject. It must be left to the Prince's Royal parents to say whether he should be a Duke of York or a Duke of Kent. At the same time, he did trust that our gracious Queen would not forget the ancient city. York was once the seat of royalty, and now that that great boon had been taken from us, he hoped that Her Majesty would determine that the Prince should be named the Duke of York. That this should be so was the ardent hope of himself, and he felt sure that it was also the anxious desire of the Council, and of the citizens at large." All the gentlemen present concurred in expressing their hope that the Royal infant might "live long to be an ornament to the nation, and an honour to their city as the Duke of York." The address was adopted by acclamation.

Windsor.—It has been determined by the Commissioners of Woods and Forests to take down the old and dilapidated houses in the lower ward of Windsor Castle, the residences of five of the Military Knights, and known as the Lower Foundation. It is in contemplation to form a noble terrace on the site of these houses, to be open to the public, affording extensive and highly picturesque views over St. Leonard's and the Great Park. It is also in contemplation to restore the Salisbury Tower, agreeably to the original plans of Sir J. Wyatville, and as they were approved of by George IV. When this has been accomplished it will afford a convenient residence for three Military Knights on the Lower Foundation. The remaining two knights on that foundation will have apartments provided for them at the upper end of Henry the Eighth's Gateway. No one unacquainted with the locality of the Royal residence can form an idea of the splendid view which will be thrown open from the upper grounds of the Castle by these arrangements. It is hoped that amongst other improvements the Horseshoe Cloisters will be razed to the ground, so that the terrace may be extended beyond the Bell Tower. It will then only remain to restore the Garter Tower, in order to effect one of the greatest improvements ever produced in this portion of the erections connected with the Castle. Several of the houses in Thames-street (portions of which are built over the old ditch of the Castle) have been recently purchased by the Crown, and the materials sold. The remainder of the houses on the Castle side of the street will also be purchased as soon as the necessary arrangements are made from time to time with the owners of the property by the Commissioners of Woods and Forests. The northern and eastern terraces will then be extended round the Castle.—In order to insure some sport during the approaching hunting season, Prince Albert has commanded a large quantity of leverets, which have been caught in the Home Park, to be turned out upon the lands, both in Buckinghamshire and Berkshire, in the immediate neighbourhood of Windsor. It is said that the occupiers of farms around Windsor will afford every facility to his Royal Highness when the proper season arrives. On former occasions, the hares caught by the Prince's harriers were invariably given, by command of his Royal Highness, to the farmers upon whose lands they were taken.

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 3273*l.*; Bristol and Gloucester, 1184*l.*; Eastern Counties, 4720*l.*; Edinburgh and Glasgow, 3628*l.*; Great Western, 18,304*l.*; Grand Junction, 10,058*l.*; Glasgow, Paisley, and Ayr, 3242*l.*; Great North of England, 2379*l.*; London and Birmingham, 21,484*l.*; South Western, 8274*l.*; Blackwall, 1424*l.*; Greenwich, 865*l.*; Brighton, 6220*l.*; Croydon, 630*l.*; Liverpool and Manchester, 5777*l.*; Manchester, Leeds, and Hull, associated, 8702*l.*; Midland, 12,102*l.*; Manchester and Birmingham, 3634*l.*; Newcastle and Carlisle, 2054*l.*; New-

castle and Darlington, 1042*l.*; South-Eastern and Dover, 6517*l.*; Sheffield and Manchester, 648*l.*; York and North Midland, with Leeds and Selby, 3310*l.*; Preston and Wyre, 597*l.*—The Great Western Company held their half-yearly meeting at Bristol last week, Mr. C. Russell, M.P., in the chair. This report stated that the revenue for the half year exceeds that of the corresponding period in 1843 by 39,056*l.* 5*s.* 1*d.*, a considerable portion of which increase is to be attributed to the greater length thrown open of the Bristol and Exeter Railway. The receipts, however, on the Great Western line itself, without difference of distance, have increased to the extent of 24,137*l.* 5*s.* 11*d.*, the whole amount for the half year being 299,443*l.* 7*s.* 6*d.* The expenditure on the half year has been 127,235*l.* 4*s.* 2*d.*, or 34.457 on the receipts, a reduction from that of the preceding year. Under these circumstances, the directors have ordered a dividend of 3½ per cent. on the paid-up capital of the company, a balance of 4702*l.* 11*s.* 1*d.* remaining to be carried to the credit of the current half-year. The amalgamation of the Cheltenham and Oxford lines with the Great Western had been sanctioned during the session, and the power of raising money on debentures obtained. The works on the South Devon line had been commenced so as to have 20 miles between Exeter and Newton ready in the ensuing summer. The Bill for the Newbury line had been rejected, mainly as it was supposed from the opposition of landowners, and the rival line from the South Western had also been thrown out, coupled with a declaration from the Lords that the Great Western presented the greatest public advantages. The Directors would consequently renew their application for the line in the next session, as also for a line to unite with the northern ones at Rugby, and the prolongation of the Trowbridge and Bradford branch to Frome, Salisbury, and Devizes. The University authorities had given their consent to the former, and at meetings held at Banbury and Oxford resolutions had been passed in its favour. The line by Trowbridge, Bradford, and Westbury, to Frome, and through Warminster to Salisbury, was much required, for bringing a populous manufacturing district into connexion with the metropolis, by means of the Great Western. The traffic of the line would yield six per cent., was easy and inexpensive, and would be called the "Wilts and Somerset Railway." The directors intended giving their support to the projected South Wales, Cornwall, and Worcester and Wolverhampton lines, and had agreed to take a lease of the latter at an annual rent of 35,000*l.* This report was unanimously adopted, and the dividend of 3½ per cent. declared.—At a meeting of the Norwich and Brandon Company last week, it was resolved that the Directors be empowered to construct a branch line to Diss and East Harding; and it was also resolved by a large majority that power be given to the directors to enter into an arrangement with the Norwich and Yarmouth Company for the amalgamation of that company with the Norwich and Brandon.—The new line of railway between Gravesend and Rochester will be opened to the public, for the conveyance of passengers on the 25th instant. It is laid down on the level of the Thames and Medway Canal, and consists of one line of rails, half the width of the canal remaining for the traffic of barges, which are towed by a steamer, the line of road being laid upon piles over the remaining half, and the towing path. The line is upwards of six miles in length, nearly two of which is a tunnel through the chalk hills to the terminus at Frindsbury, near Stroud. Gen. Pasley has examined the state of the tunnel, and has expressed himself perfectly satisfied of its safety.—At the meeting of the Ashton, Staleybridge, and Liverpool Junction last week, the Report stated that under the agreement entered into with the Manchester and Leeds Company, prior to the application to Parliament for the Act of Incorporation, the Company was entitled at any time within three years from the passing of the Act to sell, convey, and transfer all their estates, &c., to the Manchester and Leeds Railway. The latter Company had intimated their intention of making a purchase of the undertaking, and it was therefore proposed to pass a formal resolution authorising the Directors to make the sale. The Report was adopted, and a resolution adopted authorising the sale.—The Grand Junction Company, in announcing a change of trains, add, that "arrangements are in progress for attaching second-class carriages to the fast trains, for reducing the fares, and for adding a cheap train for the poorer classes."—On Sunday morning another cheap excursion train of extraordinary length left the London-bridge terminus for Brighton. The train consisted of 46 carriages, containing 1710 passengers, and was propelled by four engines. As early as 6 o'clock the office doors were literally besieged, it being announced that the train would leave at 7, but owing to the scarcity of carriages, the train did not start until 8. The train extended full half a mile, and arrived at Brighton at 11. Nearly 300 persons were left behind, but paid full fares by the regular train, which left at half-past 8.—On Monday evening, a special train of 42 carriages, containing 1075 passengers, started from the station at Euston-square to Liverpool, the fare to and from Liverpool being 30*s.* each. The passengers may return at the end of seven or ten days, and will have the opportunity of visiting several interesting places in Lancashire, as well as in England and Scotland, the fare to Glasgow being reduced to 5*s.* Trips to Wales and Ireland, as well as to Fleetwood, will form part of the amusements for these holydays.—The poor of Preston, to the number of 1000 were treated with a gratuitous trip to Fleetwood, on Monday week. The arrangements were made by the Temperance Excursion Committee, and tickets were sold at the rate of forty for 20*s.*, to benevolent individuals anxious to give a treat to those who were unable to treat themselves.

IRELAND.

Dublin.—The weekly meeting of the Repeal Association took place on Monday. Mr. Dillon Browne, M.P., was in the chair, and addressed the meeting at some length on the Charitable Bequests Bill, which he denounced in the most emphatic terms, and stated that if the Irish members had exhibited the least opposition to the measure, it would not have become the law of the land. In the course of many interviews with Lord Eliot on the subject, his lordship unequivocally stated that if it were the wish of the Irish members, he would either withdraw the Bill, or, at all events, postpone it. Mr. D. O'Connell said, that before the business of the day commenced, he had to move a resolution adopted by the parliamentary committee, and which he was sure would meet with the hearty concurrence of the meeting. He then read a resolution of thanks to Mr. Smith O'Brien, M.P., "for the services he has rendered to Ireland, not only by his powerful and unanswerable advocacy of the rights of his country in Parliament, but for the still greater benefits he has conferred upon us by his constant and unremitting attendance upon this (the parliamentary) committee." The resolution was carried by acclamation, and Mr. D. O'Connell after handing in various remittances read a letter from Mr. Wyse, M.P., acknowledging a vote of thanks for his motion in Parliament respecting the Jury at the late trials. In this letter Mr. Wyse says:—"I earnestly wish it had been in my power to have established some stronger claim to public gratitude than the honest, but successless effort to vindicate trial by Jury from even the suspicion of partiality, and an attempt to obtain at least an inquiry into allegations which, if true, as I believe them to be, go far to vitiate the whole proceedings, and inflict a serious injury not only on Mr. O'Connell and his fellow sufferers, but on the rights of all, and the cause itself of public justice. These opinions I entertained, and entertain, and shall never cease to say so, until met by some stronger argument than assertion, both in and out of Parliament." Sir V. Blake then read a letter from Dr. M'Hale, archbishop of Tuam, respecting a resolution for the more extensive diffusion of his Irish translations. The archbishop says, "Though I cannot but feel gratified by so valuable a personal compliment, coming from a body which reflects more of the national mind and feeling than was ever yet concentrated in any Irish association, my chief satisfaction springs from the growing attachment to our country, and its long neglected literature, of which that resolution is a sure indication. To advocate Irish rights, to stimulate Irish industry, to push forward Irish enterprise, and to foster Irish education, would still be an imperfect work without the cultivation of the Irish language, still so generally spoken, than which there is no European tongue more capable of undertaking the historical treasures of antiquity. To Mr. S. O'Brien my special thanks are due, who, by introducing this subject entirely unsought, has given a proof of his appreciation of the genuine language and literature of Ireland. I am rejoiced that, far younger than Cato, he is about learning the language of his fathers. It requires, perhaps, not less moral courage and vigour of mind to disentangle one's self from the fine meshes of small and foolish anti-national fashions, than it does to grapple with the more formidable difficulties of anti-national misrule. It well becomes him to be the foremost in asserting and cultivating the venerable language of his country, whose ancestor stands out the most prominent name in its dark annals, and to the celebration of whose reign, in achieving the freedom of Ireland, the most precious specimens of its ancient literature have been devoted." Mr. D. O'Connell, jun., made the usual report from the prison, stating that his father was well and full of hope. A letter was read from Mr. O'Brien to the secretary, desiring that the correspondence which had taken place between him and the secretary of the Agricultural Society, should be read to the meeting. It appeared from this that at the dinner of the Royal Irish Agricultural Society on the 16th, the Earl of Erne, Vice President of the dinner, introduced in the course of his speech a strong political allusion, in violation of a fundamental law of the institution. The passage of his Lordship's speech which contained this allusion was as follows:—"Improvements, and great improvements, had been recently effected in the condition of the tenant-classes in Ireland. He made the assertion fearlessly, for he was in a position to vouch for its veracity. Great improvements had, he repeated, been effected in their condition, and by what agency, he asked, had these salutary changes been brought about? By whom were they effected but by the landlords? By what other agency could they be effected? Surely it was not the large sums of money which were collected from year to year, from month to month, and from week to week, that could have done this? [The enunciation of this sentiment produced a marked sensation amongst the company—some cheered loudly, others hissed and groaned, and amid loud cries of 'order, order,' from all parts of the house, Mr. Smith O'Brien, who was seated in the vicinity of the chairman on the right hand side, rose from his chair and walked out of the theatre. He was followed immediately by Mr. Maher, Member for Tipperary, and both gentlemen were cheered loudly by the greater number of those who were sufficiently near them to observe their movements.] Lord Erne continued his address unconcernedly, and again repeated his conviction that it was to the resident landlords alone that the country was indebted for those salutary changes which he described as having taken place in the condition of the tenant classes. He would not go so far as to say that there was no such thing in Ireland as a bad landlord. There were of course good and bad amongst them, as there were amongst all classes in the community; but this he would say, that the great majority of the Irish landlords were good." Lord Erne's reference to the Repeal Association elicited immediately a letter from Mr. Smith O'Brien to the Secretary, requesting to be informed whether the Council sanctioned such language. The Council replied that, "Lord Erne having come forward and expressed in the promptest and most handsome manner his regret that any observations should have fallen from him of a political tendency, and calculated to offend the feelings of any member of the Society, and which expressions were contrary to one of its fundamental rules, it was unanimously resolved—That it is a matter of the greatest gratification to the Council that so satisfactory an explanation has been given by the noble Earl, retaining as they do the strongest conviction that the security and prosperity of this great Society can be only preserved by a complete abstinence at all its meetings from allusions of a political tendency." Mr. S. O'Brien acknowledged this resolution in a letter from which the following is an extract:—"I trust that the prompt, honourable, and explicit reparation which has been offered by Lord Erne to those whose feelings may have been hurt by his unguarded expressions will be deemed as satisfactory by others as it is by me, and that this incident may prove serviceable, rather than injurious, to the interests of one of the few national institutions in regard of which Irishmen of every class, creed, and party are enabled to co-operate for the common good of all." The whole of this correspondence was ordered to be entered on the minutes. Mr. Grattan, M.P. then addressed the meeting, and spoke highly of the Agricultural Society. Mr. D. O'Connell also adverted to the Society, and expressed himself perfectly satisfied with what had occurred subsequent to the speech of Lord Erne, and with his Lordship's frank and ingenuous admission of his error. He then proposed a vote of thanks to their chairman, Mr. R. D. Browne, for his patriotic conduct at all times, but particularly during the late session of Parliament, which was carried. The Rent for the week was 1162*l.* 3*s.* 9*d.*—The Earl of Devon held an inquiry under the Land Commission at Nenagh on Friday. The Commission were to attend at Kilmallock, county Limerick, on Tuesday, the 27th, and at Ennis on Wednesday.—A Report from the Drainage Commissioners states that, although the Act has not yet been two years in operation, 48,293 acres have been surveyed and reported on, and measures devised for their improvement, including works extending along 291 miles of river and and main drains.

Cork.—On Wednesday week as H. M.'s steam-ship Stromboli, Lieut. Hon. E. Plunket, was on her passage from Cork to the Shannon, she struck on a reef of rocks at the mouth of Bantry Bay. She had a Galway pilot on board, not well acquainted with the Cork and Kerry coast, to which the casualty is attributed. The guns, ammunition, and stores, having been taken out of the Stromboli and landed on Bear Island to lighten her, the Tartarus and Hecate steamers broke their chain cables on Friday in the effort to draw her off, but eventually succeeded, and she returned to Cork.

SCOTLAND.

Aberdeen.—The Bishop of Aberdeen has just concluded his triennial visitation of his diocese, and the number of confirmations this year has been most gratifying to the well-wishers of the Episcopal Church of Scotland. The following table exhibits the numbers confirmed since last visitation:—Aberdeen, in the three years, 491; St. Andrew's, 100; St. John's, 33; St. Paul's, once, 16; in all, 640.

Jedburgh.—On the 15th inst., the church of St. John the Evangelist was consecrated by the Bishop of Glasgow. A long procession of clergy, in their surplices, headed by four Scotch bishops, entered the church, when the petition of consecration was read by Earl Talbot. The service of consecration then commenced, and morning prayer was chanted by a most efficient choir. The lessons were read by the Rev. Lord Henry Kerr and Archdeacon Wilberforce. A sermon was preached by the Rev. Dr. Hook, vicar of Leeds; after which, the communion was administered to the clergy and a large body of laity. The offertory amounted to upwards of 100*l.* At evening service, the second lesson was read by the Rev. John Keble, at the conclusion of which, the Rev. W. S. White, domestic chaplain to the Marchioness of Lothian, was instituted to the incumbency of the church by the Bishop of Glasgow, who delivered an appropriate address. The sermon was preached by Archdeacon Wilberforce. Besides the Scotch clergy, a considerable number of English clergymen attended the consecration, among whom were the Hon. and Rev. John and Charles Grey, Rev. W. Dodsworth, &c. The church, which is of the decorative style, is said to be a perfect development of the ritual of the reformed church, and is admired for the beauty of its architectural arrangements. All the windows are of stained glass; the floor is inlaid with encaustic tiles; the open benches are of oak, and beautifully carved. The altar, credence, piscina, sedilia, and pulpit, are of stone, and were presented by Lady Lothian and the Queen Dowager.

Glasgow.—The Aberdeen and Inverness papers give favourable accounts of the sport in the north, with which the reports from the moor-grounds at Eaglesham, Barr, Portmark at the head of Loch Doon, and the Stewartry of Kirkcudbright, coincide. The accounts from keepers

...matters estimate that there are four birds ... last season, and that many of the coveys ... fourteen birds. There is also every ... sport on the 1st September, as harvest ... early, and hares and partridges plentiful. ... game in Glasgow this week is nearly ... was this time last year, and in good con... are selling at from 5s. to 7s. per brace; ... 1s. 6d. to 3s. each.

Dundee.—Within the last day or two letters have been received at Dundee respecting the brig Hannah, ... to that port, from which strong suspicions are ... that the captain, Mr. Lowther, was murdered by the crew, for the purpose of possessing themselves of the vessel and cargo, but afterwards their plans were frustrated by the ship becoming leaky. The boats containing the crew were picked up by the barque ... her voyage to Quebec, and the accounts ... were so unsatisfactory, that the captain ... instituted an inquiry at Quebec, which led to the imprisonment of the men. A few days after ... a vessel that had put into Quebec reported that the wreck of the Hannah had been discovered on the banks of Anticosti, and that it had, he believed, been taken in tow by another vessel, to bring her into that port. Her arrival was looked for with interest, and on the 28th the Hannah was brought safely into Quebec, with very little damage. It is needless to say that the master, Captain Lowther, was not to be found, nor any of the ship's papers. The prisoners were to undergo a second examination on the 12th inst., and in the meanwhile every possible inquiry was to be made. The Hannah was heavily laden, but the nature of her cargo is not mentioned.

Miscellaneous.

The late Rev. H. F. Cary.—We recorded last week the death of the Rev. Henry Francis Cary, whose remains were on Wednesday last interred in Poet's-corner, Westminster Abbey. At the early age of fifteen, Mr. Cary published an ode on the death of Kosciusko, which attracted public notice, and was mentioned in several periodicals of the day as giving evidence of great youthful genius. At the early age of eighteen he was entered as a commoner of Christ Church, Oxford, where he proceeded to the degree of M.A. While at Oxford he pursued his studies with unremitting diligence, and made himself conversant not only with the great authors of antiquity, but with almost the whole range of Italian, French, and English literature, as the notes to the first edition of the translation of Dante fully evidenced. In 1805 he published the "Inferno" of Dante in English blank verse, with the text of the original. An entire translation of the "Divina Commedia" appeared in 1814, but the work lay almost unnoticed for several years, until Samuel Taylor Coleridge, forming at the same time an acquaintance with the translator and his great work, drew public attention to its merits; from that time the work has taken its place among our standard English authors. To this Mr. Cary afterwards added a translation of the Birds of Aristophanes and of the Odes of Pindar. But, perhaps, the not least valuable part of his literary labours is to be found in his continuation of Johnson's "Lives of English Poets," and his "Lives of Early French Poets," all which have hitherto only appeared anonymously in the *Old London Magazine*. In 1826 he was appointed assistant librarian in the British Museum, which office he resigned about six years since. From that period he had continued his literary labours with almost youthful energy, having edited the poetical works of Pope, Cowper, Milton, Thomson, and Young, together with a fourth edition of his own "Dante," to which he added many valuable notes. The late Government marked its sense of his literary merits, by granting him a pension of 200*l.* a year.

Dr. Wolff's Mission.—We regret to find by letters from Constantinople of the 17th, a confirmation of the rumour previously brought by the German papers of the arrest and detention of Dr. Wolff by the tyrant of Bokhara, and which we noticed on the 3d inst. The situation of the reverend gentleman is one to create great anxiety and alarm to all the friends of humanity. It appears as if his fate were made to depend in some measure on the result of a war in which the Khan is engaged. Should the war be of protracted endurance, so must be his captivity. Should the Khan be defeated, his fate will most probably be slavery or death. It is said that, after having fully informed himself of the details of the captivity and death of the unfortunate men of whom he went in search, Dr. Wolff was preparing to return, when he was arrested by order of the Khan, and told that he must not quit the country till a war which had just been declared against Kokhan should have terminated. No means more efficacious than those which have been employed, fruitlessly, for the release of Stoddart and Conolly are at our disposition for saving Dr. Wolff from slavery, and perhaps from death. It is melancholy to think that such should be the result of the long travel, the dangers, and privations which Dr. Wolff, with an indomitable spirit rarely equalled, has undergone, and for an end so truly Christian.

The Rich and the Poor.—Baron Alderson, a few days since, addressed the following remarks to the Grand Jury of the county of Suffolk:—"In a neighbouring county which I passed through on the Circuit this time, I had, what I am afraid I shall not have here—a day of rest; and I went out into the country and had the pleasure of seeing a match of cricket, in which a noble Earl, the Lord Lieutenant of his county, was playing with the tradesmen, the labourers, and all around him, and I believe he lost no respect from that country, rose in it rather than otherwise, but they did not respect him less. I believe that if they themselves associated more with the lower classes of society, the Kingdom of England would be in a far safer, and society in a far sounder, condition. I wish I could put it to the minds of all to think so, because I think it is true."

Sir William Follett.—The Attorney-General left England a day or two since, to try what effect the more genial climate of Southern Europe, as well as the total abstinence from all professional and political duties, may have upon his shattered constitution. It is a melancholy thing to contemplate this result, when we remember in the opening of his well-known fame some ten or twelve years since, when he entered the House of Commons as the representative of his native city of Exeter, and still more melancholy to find, that now, when the very highest honours of his profession, with its futurity of influence, fame, and wealth are opening up to him, he has in seeking them nearly destroyed that health, without which all these great objects of honourable pursuit become valueless. But the lesson is a moral one.—*Cheltenham Examiner.*

The King of the French.—We extract the following interesting paragraph, relating to His Majesty Louis-Philippe, from the *Voss Gazette*, a Swedish journal:—"On the 24, Vice-Consul Burk celebrated the 824 anniversary of his birthday. On the same day he received a letter from the King of the French, written with his own hand, accompanying a gold medal, bearing on one side the profile of His Majesty, and on the other the following inscription:—"Given by King Louis-Philippe to M. C. Burk, as a memorial of the hospitality received at Hammerfest, in August, 1795." The letter, which was dated at Neuilly, June 6, is in these terms:—"It is always agreeable to me to find that the traveller Muller has not been forgotten in a country which he visited in simple guise, and unknown; and I always recal with pleasure this journey to my mind. Amongst my recollections, I give the first place to the hospitality so frankly and cordially granted me, a stranger, throughout Norway, and particularly in Norland and Finmark; and at this moment, when a lapse of 49 years since I made this journey into Norway has left me but few of my old hosts remaining, it is gratifying to me to be able to express to all, in your person, what grateful feelings I still entertain."

Another Tom Thumb.—The Venetian journals notice the discovery of a native dwarf, of very extraordinary diminutiveness and unusual mental qualifications, almost unprecedented, except in the instance of the distinguished visitor, General Tom Thumb. This new genius is named Pietro Bianchi, and is a native of Istria, being born a few miles from the celebrated cape of that name, and in a district which is somewhat famous for giving birth to dwarfs; for more than one has been noticed of extraordinary restricted growth within the last few years. He is above 21 years of age, and only 2 feet 10 inches high, and weighs less than 24lb. He is well-proportioned, and agreeable in face and figure, and devoid of all those deformities which generally distinguish dwarfs; the form of his head is particularly fine, and the development of his mind is in conformity with his age. He has learned several languages with great ease, and speaks fluently, besides his native tongue, the Illyrian, the Italian, German, and Croatian. He is shortly to visit the European cities.

Ascent of Mont Blanc.—A letter from Geneva gives some details of a second attempt of Messrs. Bravais and Martins to ascend to the summit of Mont Blanc, a former one having failed on account of the objections of the guides. On the 2d they set out, and reached the Grands Mulets. A second party followed them, composed of three young Englishmen and a Hungarian; they all slept there that night, and on the third the latter party set out first, and reached halfway from their sleeping place to the summit, but were then compelled to return from fatigue and fear of bad weather. The servant of the Hungarian, however, prevailed on two of the guides to go on with him, and they all three reached the top. They remained there only 10 minutes, being alarmed by a dense cloud floating below them. The descent was very dangerous, the cloud having condensed into a coat of thick snow. Messrs. Bravais and Martins remained below where they slept, and if the whole of the two parties had not retired immediately, they would have been in great danger of perishing. They returned in the evening to Chamouni.

Law.

CENTRAL CRIMINAL COURT.—*The Stepney Poisoning Case.*—At the sitting of the Court on Wednesday *James Cockburn Belany*, aged 33, was placed at the bar to plead to the indictment charging him with the wilful murder of Rachel Belany, his wife. The indictment contained four counts. The first charged the prisoner with having, on the 8th June, in the parish of St Dunstan, Stepney, unlawfully administered to Rachel Belany a large quantity of prussic acid, from the effects of which she died. In the second count the prisoner was charged with the same offence upon Rachel Skelley. The third count varied the form of the charge, and the fourth charged the prisoner with the murder of a woman whose name was unknown. The prisoner, who was dressed in black, and appeared perfectly calm and collected, listened attentively to the reading of the indictment, and pleaded not guilty in a firm tone. He was then arraigned upon the Coroner's inquisition for the wilful murder of Rachel Belany; to this he also pleaded not guilty. The Solicitor General stated the case for the prosecution. After a few preliminary observations, in which he cautioned the jury that the case was one entirely of circumstantial evidence, yet, nevertheless, they should equally avoid the suggestion of doubts and difficulties, and the too ready acceptance of suspicion, the Solicitor-General proceeded to detail the case as it was about to be exhibited in evidence, directing the attention of the jury particularly to the two wills prepared by the prisoner [illegible] he brought the wife to London, the great love which he [illegible] Miss Emmett's property, after her marriage, her acknowledged [illegible] and her apparently perfect [illegible] of mind and body. He then described the particulars of the previous night, and that [illegible] the apothecary's shop in Ratcliffe-road. He then described the [illegible] the deceased, and that [illegible] the deceased, and that [illegible] the deceased, and that

that she had died of poison to be discovered at the inquest Mr. Baron Gurney then proceeded to sum up the evidence. It was now his duty to give such assistance as lay in his power to the jury, in aiding them to form a conclusion upon the painful subject before them. It was a most awful and most anxious case. The crime with which the prisoner was charged was one of the most atrocious and revolting he had ever heard. It was a charge of murder, by means the most odious and detestable. The person alleged to have been murdered was that one whom the prisoner was bound to love, cherish, and protect above all else in the world. It appeared that she was young, beautiful, and fascinating in manners and accomplishments, that she had been his wife for nearly two years, and that they had lived on terms of the greatest apparent happiness and affection so far as had been observed by all who had any opportunity of seeing or observing them, and the deceased was in a situation the most interesting, being about to give birth to a child. A case of this kind undoubtedly called for the most anxious attention from the jury. It differed from almost any he had ever known in these circumstances, that, generally speaking there was a difficulty either in ascertaining whether the death was occasioned by poison, or whether the accused was the person from whose hands the poison came. In this case there was no doubt that the unfortunate lady had come to her death by means of poison —that that poison was prussic acid—a poison one of the most fatal, certain, and speedy in its effects: and it was equally certain that the poison came from the hands of the prisoner. It was proved beyond doubt that he purchased it, and by his own statement he had left it unprotected in the chamber of his wife. It was certain she died from partaking of it; and the question, therefore, that the jury had to consider was, whether she—having so died from the effects of the poison—had received it from the prisoner's hands, or it had been placed purposely in her way by him in order that she might take it herself. The secrets of the human heart were known to God alone, and human tribunals could only judge of those secrets entertained within by the conduct of the individual at the time. In this case the jury had the conduct of the prisoner, his words, his letters, and his demeanour proved before them, and on these they should decide whether on the whole of the case they believed he either administered the poison, or placed it within her reach in order that she might take it. If he did either of those things he was guilty of murder. If they thought he had merely acted incautiously and negligently by leaving the poison in the manner he had himself stated, he would not be guilty of murder, and they should acquit him. It appeared that the marriage between the prisoner and his wife had been contracted with the full consent of the lady's mother, and had been a happy one. His lordship went into a general review of the circumstances connected with the journey to London, and then proceeded to the evidence, on which he commented as he went along. He drew attention to the several circumstances which had been deposed to by the witnesses, both for the prosecution and defence. Having gone through the entire of the oral evidence, his lordship next called the attention of the jury to the letters written by the prisoner, and these, he should observe, were of a most extraordinary nature. The first, which was dated the 5th June, and directed to Mr. Bell, spoke of the delicacy of Mrs. Belany, but added, that a little rest would bring her round. Now, in all the subsequent proceedings at Stepney, there was certainly no rest. They had heard of nothing but a constant round of amusement. They were in constant motion, with the exception of the one day, Wednesday. However, in the case of a lively young woman, such as the deceased appeared to be, it was not much to be wondered at that she should try to see as much of London as possible. They would, therefore, not lay much stress upon that. The next was of greater importance. They had not this letter in evidence, it having been destroyed, but they had evidence of its contents from Mr. Dinning. He had received it on the 8th, so that by the evidence of the postmaster it must have been posted in London on the 6th, the day after the prisoner had written to Mr. Bell. It appeared then that the prisoner wrote to Mr. Dinning that his wife was very unwell; that she was attended by two medical men; that there was fear of a miscarriage; and that such was her dangerous state altogether, that he should give up all hopes of being able to go to Loo to see the falconry. The jury should observe that, by the evidence of Captain Clark, on that very day the prisoner had arranged with him to leave his wife with Mrs. M'Eachan, whilst he should go to Loo. That was on the 6th. The next letter was that of the 8th, and that was certainly posted after the death of Mrs. Belany. They could not tell whether it was written after or before. If written before the death it made still more strongly against the prisoner. If written after, he (Mr. Baron Gurney), should presently make some further comments upon it. His Lordship read the letter, and went on. This letter if not written after the death, was at least posted after. If written before, it certainly concurred with the letter written on the Thursday to Dinning, about Mrs. Belany having been attended by two medical men, and it also stated the nature of the indisposition. But another consideration here presented itself with regard to the defence set up by the prisoner. The defence was that he did not expect his wife's death; that when he went into the room he was surprised and horrified at what had taken place, that he knew from what it had arisen, and was anxious to conceal his negligence. Now the letter was of a similar nature to the one written two days before, and mentioned the two medical men as being in attendance. The jury would recollect that Captain Clark said that several times that day the prisoner had used exclamations that it was through his negligence, entirely through his fault, his wife had met her death. There were some matters with regard to the prisoner's statement of the occurrence to which the jury should also attend. [His Lordship read the medical evidence regarding the operation and effects of prussic acid.] The medical men concurred in one opinion that there was a scream, caused by the action of the respiratory muscles, after partaking of prussic acid, and that after that all power and volition ceased. Speech was impossible. His Lordship again read the statement of the prisoner. On the Monday the prisoner made this declaration to Captain Clark; but before that he had written another letter to Mr. Bell. This letter was posted after eight o'clock in the morning, and before five in the evening. His Lordship read the letter. The prisoner thus wrote on the Monday, not making any communication about the real cause of death. The rest of the letters were all written after the prisoner was taken into custody, and consequently after he was aware of the nature of the charge against him. They were therefore written with a full knowledge of the accusation, and the line of defence which was necessary; and, consequently, were not much to be relied on. He, Mr. Baron Gurney, should here observe, with regard to the letters written on Saturday and Monday, that they were both very composed and perfectly collected. There was not a sign about them of the writer being distracted or discomposed. But those written after he was taken into custody are of quite another description; they show considerable distraction. His lordship read a part of the one to Mr. Embleton, containing a great number of expressions of distraction, such as "oh, God!" &c., but giving an exceedingly close and remarkably circumstantial detail of the occurrences which led to the death of Mrs. Belany, in the midst of which his lordship broke off and observed that this was, despite the expressions of distraction, a very circumstantial statement. After a few further observations his lordship drew to a close. He left it now to the gentlemen of the jury to form their judgment upon the facts. They should be convinced beyond all doubt either that the prisoner administered with his own hands, or placed the poison in the way of the deceased, before they could convict. But if they had the slightest doubt they should acquit him. There were several strange circumstances unaccounted for. The falsehood before the death about the two medical gentleman attending her, followed up by a similar statement in the second letter, with the additional falsehood that they said she had a complaint of the heart; the assertion in the room where his wife was dying that she was dying of heart complaint, and that it was hereditary; that her mother had died of it; whilst it was proved that he had registered her death as having resulted from bilious fever, and it had been verified under his own handwriting. However, these matters were all before the jury, and it was for them to form a judgment upon them. And he would conclude by begging them to remember that it was better ten guilty men should escape than that one innocent man should suffer. The jury retired at ten minutes after one o'clock to consider their verdict. At a quarter past five they returned into court, and announced the verdict to be Not Guilty.

Edward Brown, a young man respectably connected, surrendered on the charge of obtaining by false pretences, on the 17th April last, the sum of 350*l.* from Richard Edward Arden. Mr. Clarkson stated the case, as it appeared by the evidence of the prosecutor. Mr. Richard Edward Arden deposed that he was a solicitor, residing in Gray's-inn-square. The prisoner was introduced to him on the 13th March last by a person named Morgan. Witness had pecuniary transactions with him. On the 17th April, the prisoner called upon him and produced a bill for 975*l.* 10*s.*, drawn by Pott, Baxter, and Brown, on Thomas Roberts, of Liverpool, and accepted by Roberts, payable at Glynn and Company's, at three months after date, which he requested witness to discount. Witness said he was not in the habit of discounting bills, and disliked them. He also said he knew nothing of the parties, and asked the prisoner several questions, to which he replied that Roberts was a wool-broker at Liverpool, very respectably connected, and that he had dealings with the house of Pott, Baxter, and Co. To further queries, he said that the bill was a good one, taken in the course of business for a *bond fide* consideration, and it would be surely paid when it was due. He also said he had a large sum in the house of Pott, Baxter, and Brown, in which he was a partner, adding that his own connexions and his wife's were highly respectable, and he himself possessed a good property, and was a freeholder. He said the house of which he was a partner was extensively connected, and that they frequently required advances. Witness asked him was it worth his while to obtain money in such a manner? and the prisoner replied that he got 30 per cent. for sending goods to Valparaiso, and it was therefore an object to obtain money in the way required. Witness subsequently gave him a cheque for 350*l.* on the faith of his representations, and the bill for 975*l.* 10*s.* was handed to him (witness). He subsequently handed the prisoner a second sum of 350*l.* When the bill became due it was dishonoured, and he found that all the representations made by the prisoner were false, and his name appeared in the *Gazette* as a bankrupt. On cross-examination by the Solicitor General, the prosecutor admitted that he had not been bound over in recognizances to prosecute, previously to going before the grand jury. The Solicitor-General submitted to his lordship that the indictment was bad. The offence was laid as committed in London, whereas it should have been Middlesex, according to the evidence. And, by the act of Parliament, although previous recognizances need not be entered into in London, they should be in Middlesex, before going to the grand jury. Mr. Clarkson admitted the error. After a long discussion, the jury, under the direction of the Recorder, returned a verdict of Not Guilty.

SUMMER ASSIZES.—OXFORD CIRCUIT, GLOUCESTER.—*Newton* v. *Holford and others*.—This was an action of trespass, brought by Mr. Augustus Newton, barrister-at-law, against the late High-Sheriff of this county, and four other defendants, officers and assistants of the sheriff, for breaking and entering the house of the plaintiff, injuring the locks of the doors, and beating the sons of plaintiff. The defendants paid 2*l.* into court, and pleaded that plaintiff had not sustained any further damage. The plaintiff appeared in person to conduct his own case; Mr. Serjeant Talfourd and Mr. Greaves represented the defendants. The action arose out of a proceeding which has already formed the groundwork of two trials, one of which (a civil action) took place at the last Middlesex sittings in the Court of Common Pleas at Westminster, and the other (an indictment for perjury) at the last Worcester assizes. It will be necessary, therefore, in order to make a report of the present case intelligible, to go a little farther back than the 5th July, 1843, when the trespass now in question was committed. The plaintiff having become indebted to a wine merchant in the amount of 12*l.*, was served with a copy of a writ, and consented to a judge's order to enter up judgment, which was accordingly entered up, and a writ of *ca. sa.* was issued thereon. An officer of the sheriff of the city of Gloucester arrested the plaintiff by virtue of that writ while he was attending the Midsummer Quarter Sessions last year, at Gloucester, in his professional capacity, and the plaintiff claimed the protection of the Court. Mr. Serjeant Ludlow, who presided, declined to make any positive order on the subject, but suggested an arrangement, by the terms of which the plaintiff was to be at liberty to pursue his professional avocations during the continuance of the sessions, the plaintiff on his part undertaking not to take any advantage of the first arrest. A few days after the quarter sessions had concluded, the writ of *ca. sa* was placed in the hands of George Wilson, a special bailiff nominated for the purpose, and he proceeded, accompanied by Holtham, Turner, and Vines, the other defendants on the record, to the residence of plaintiff at St. Paul's Cottage, Cheltenham. The bailiffs arrived there about a quarter to twelve o'clock in the day, and finding the garden gate could not be opened from the outside, Wilson scaled the paling. The plaintiff's younger son, William Philip Newton, came up at the moment, and attempted to get over the paling at a different place, but the defendant Turner pulled him down by the leg into the road. Being, however, young and active, the youth succeeded in getting over the paling before Wilson could accomplish the same feat, and immediately ran to his mother, Mrs. Newton, to acquaint her with what was taking place. He then ran back, and tried to set a large Newfoundland dog at Wilson, who being forewarned, was armed, and presented a pistol, threatening to blow out the dog's brains, if it was not taken away. The lad, frightened out of his wits, ran away as fast as he could, and one of the servants shut up the dog in a stable. The defendant Wilson then got down into the garden, and opened the gate for Holtham, Turner, and Vines, who went with him to the front door, and endeavoured to obtain admittance, which was refused. The bailiffs then retired for a short time under the shade of some trees, and finally effected an entrance by the back door, which, according to the plaintiff's case, was burst open by the defendant Wilson. The bailiffs then entered, arrested the plaintiff, and took him off in a fly to Gloucester gaol. The plaintiff's eldest son, Francis Robert Newton, was pushed about a little by the defendants in getting through the passage, and the plaintiff brought two actions for what occurred, one of which, in which the cause of action alleged was false imprisonment, was tried in the Common Pleas, and the plaintiff was fortunate enough to obtain 50*l.* as damages. The other action was that which was tried to-day, in which the gravamen of the plaintiff's complaint was, that his door had been broken, and his two sons had been assaulted, by which he lost the benefit of their service. Mr. Serjeant Talfourd addressed the jury for the defendants, contending that the 40*s.* which had been paid into court was an ample compensation for the injury which the plaintiff had sustained. The jury, being of the same opinion, found a verdict for the defendants.

BIRTHS.—On the 9th inst., in New Burlington-street, the lady of T. F. CHILVER, Esq., of a son—10th inst., at 15, Dorset-terrace, Clapham-road, Mrs. CUNNINGHAM, of a son—10th inst., at 54, Millbank-street, Westminster, Mrs. J. C. LETHBRIDGE, of a son—10th inst., at Park-street, Windsor, the lady of Major ANDERSON, of a daughter—10th inst., at Greenwich, the lady of A. R. BRISTOW, Esq., of a son—11th inst., at Looseleigh, near Plymouth, the lady of W. ELLIS, Esq., of a daughter—11th inst., at her residence, 18, Arbour-terrace, Commercial-road, the lady of G. WARD, Esq., of a daughter—12th inst., at Milton-next-Gravesend, Mrs. G. E. SHARLAND, of a daughter—14th inst., at the vicarage, Somerton, the lady of the Rev. W. R. NEWBOLT, of a son.

MARRIAGES.—Recently, in the Chapel of Lambeth Palace, by his Grace the Archbishop of Canterbury, LORD CLAUD HAMILTON, M.P., brother to the Marquess of Abercorn, to Miss E. E. PROBY, second daughter of Rear-Admiral the Hon. G. L. Proby, and niece of the Earl of Carysfort—10th inst., at Sholden, Kent, T. B. MAY, Esq., of the Inner Temple, barrister-at-law, to NANCY E. A. BANKS, eldest daughter of the late John Banks, Esq., of Halling, Kent, and granddaughter of the late Sir E. Banks—10th inst., at Milton-next-Gravesend, Major J. AGNEW, Colonial Secretary, Dominica, to HELEN C. BRANDON, third daughter of H. Brandon, Esq., of Gravesend—10th inst., at St. James's Church, Dover, D. DAVIES, Esq., of Lower Belgrave-street, Eaton-square, to MARY CAPEL, eldest daughter of J. Capel, Esq., of Fitzroy-square.

DEATHS.—On the 10th inst., JULIA LIDDELL TWIGG, second daughter of the late Mr. J. Twigg—11th inst., at his son's house, Trafalgar-lodge, Chelsea, W. T. WEBB, Esq., aged 77—11th inst., at his residence, Clifton-place, Camberwell New-road, Mr. J. NANSON, upwards of 30 years in the bank of Messrs. Barclay, Tritton, and Co., aged 50—12th inst., at Winchester, Lieut. A. R. SHAKESPEAR, of the 49th Regiment—12th inst., at Compton Pauncefoot, Somerset, L. G. H. HUNT, Esq.—12th inst., at the house of her father, G. K. Paxon, Esq., of Hampstead, EMMA WYCHE, aged 25; also, on the 18th inst., at the residence of his father, Grove-hill, Camberwell, the Rev. J. P. T. WYCHE, M.A., husband of the above, of Cranfield, in the county of Bedford, aged 38. He was suddenly seized while attending divine worship in the morning at Emmanuel Church, Camberwell—13th inst., LADY A. E. MONTAGU SCOTT, eldest daughter of the late Charles William, Duke of Buccleuch and Queensberry—14th inst., at Topsham, near Exeter, where he had gone for the benefit of his health, CHAS. EDWIN GWILT, third surviving son of G. Gwilt, Esq., of Southwark, aged 33—15th inst., S. L. KENT, Esq., of High Wycombe, formerly of Carpenters' Hall, London Wall, aged 69—15th inst., at her residence, Richmond-green, Miss E. WALMESLEY—15th inst., at the Manor-house, East Ham, Essex, KATHARINE J. FRY, second daughter of W. S. Fry, Esq., aged 6 years—16th inst., of a disease of the heart, at his house, White Hart-street, Kennington, T. SILLITOE, Esq., late of the Freight Office, East India House, aged 50—16th inst., at his residence, Bristol-road, Birmingham, J. KETTLE, Esq., aged 75—16th inst., at Ladbroke-place, Notting-hill, the Rev. T. C. BROWNE, vicar of Halse, Somersetshire, aged 31—16th inst., T. W. TYNDALE, Esq., of the Middle Temple, barrister, aged 49—16th inst., ELIZ. TODD, relict of the late R. Todd, Esq., of 20, Alpha-road, Regent's Park—16th inst., at Upminster, MARIA BOYCE, third daughter of Mr. T. Boyce—17th inst., G. SHARP, Esq., of Walthamstow, and 31, Winchester-street—17th inst., Mrs. M. SMITH, relict of the late Mr. W. Smith, of Southampton-row, Bloomsbury—20th inst., at the Dell, near Windsor, the BARONESS ROSSMORE.

SEED TRADE.

WANTED, a SHOPMAN who well understands the business in all branches. A liberal Salary will be given to a competent person.—Apply to J. G. WAITE, 1 & 4, Eyre-street-hill, Hatton Garden.

WANTED, a GARDENER, who thoroughly understands the management of plants, viz.:—Flower-Garden, Greenhouse, Conservatory, Hothouse, and Orchidaceous Plants, the growth of Melons, early Cucumbers, and Vines. The Houses are all on a small scale, but the greatest neatness and order are required throughout. Besides the Gardener now wanted, there is a regular Kitchen-Gardener kept, also a young Man under the principal Gardener. Everything relating to the Flower department must be kept in the very best order. His travelling expenses will be paid, but if he does not suit he must defray them back himself. His character must bear the strictest inquiry from the family he last served. A Cottage is found.—Direct to W. H., Lymington, Hants, for a week; after that to Gunfield Cottage, Dartmouth.

WANT PLACES.—All Letters to be post-paid.

AS HEAD GARDENER, a steady Married Man, without incumbrance, who understands his business in all its different departments, forcing, and the management of land, &c.; can have a good character from the gentleman he has just left. Direct to A. P., No. 9, Spring Gardens, Clapham, Surrey.

AS GARDENER.—A respectable Married Man, aged 37, who perfectly understands his business, including the management of Pines, Vines, Peach-house, Green-house, Flower and Kitchen-Gardens, and all other Forcing departments. The only reason for leaving his last place is on account of his late master's decease. Direct to A. W. C., Mrs. Plym, Bretten Terrace, King's Road, Chelsea.

AS GARDENE Lady & Gentlemen are anxious to obtain a Situa a highly respectable married man, without incumbrance, who lived many years in their family—age about 40. He can be highly recommended as industrious and trustworthy; has a perfect knowledge of his business in all its branches; could manage 30 or 40 acres of Grass land. Wages not so much an object as a comfortable family, with a Lodge to live in.—Direct to M. W., Post Office, Clifton Street, Finsbury Square.

AS GARDENER.—Mr. J. ROBERTSON, Gardener to Mrs. Lawrence, Ealing Park, Ealing, Middlesex, can confidently recommend a young Man as Gardener to any Nobleman or Gentleman in want of a competent and trustworthy servant. He has likewise lived as foreman in two Noblemen's gardens, by whose gardeners he can also be recommended.—Direct as above.

AS GROOM and GARDENER, or GARDENER and COWMAN.—A married Man, aged 25. His Wife can act as Dairymaid. No objection to any part of the country.—Direct to W. S. W., Post-office, Hoddesdon, Hertfordshire.

AS GAMEKEEPER.—A married Man, aged 40, who perfectly understands the Raising and Preserving of Game; has had great practice in rearing Pheasants by hand, and possesses every information necessary for a Gamekeeper. Has no objection to the management of Land, if required. He can have the most satisfactory character from the nobleman he last left.—Direct to A. B., Post-office, Totton, near the New Forest, Hants.

AS BAILIFF and GARDENER, or either.—An active, single Man, who has had extensive practice in the above capacities, in the Channel Islands, Great Britain, and Ireland, on the most improved principles. Can produce an unexceptionable character from the gentleman he has served for the last 10 years, as to integrity and ability.—Direct to D. F., 8, Dorchester-place, Blandford square, London.

AS FLOWER-GARDENER, or Gardener in general.—A Married Man, aged 28, with one child, who perfectly understands his profession, having been brought up in several private establishments, and can have nine years' unexceptionable character from his present employers.—Direct to G. W., at Chandler and Son's, Nurserymen, Vauxhall.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

A Stamped Newspaper of Rural Economy and General News.—The Horticultural Part Edited by Professor Lindley.

No. 35.—1844. SATURDAY, AUGUST 31. [Price 6*d.*

PRIZES OPEN TO ALL ENGLAND will be awarded by the THANET FLORICULTURAL SOCIETY, on Thursday, the 12th September.

Best 24 Dahlias, 4*l.*; Second-best ditto, 2*l.*

Place of Exhibition, Ranelagh Gardens, St. Peter's, near Margate. No entrance money demanded.

FUCHSIA "CONSTELLATION."

WILLIAM MILLER begs respectfully to inform his Friends who have kindly favoured him with their orders for the above splendid Fuchsia, that his stock only consists of a few plants, and he is therefore obliged to defer sending it out this year.

N.B.—Wanted a quantity of seedling Bupleurum frutescens. Providence Nursery, Ramsgate, Aug. 27, 1844.

CARNATIONS AND PICOTEES.

JOHN DICKSON, Acre-lane, Brixton, Surrey, has prepared for the growers of these splendid flowers a Catalogue, enabling them to judge of their qualities, with the prices annexed, which may be had at the Nursery, and of Messrs. Warner and Warner, Cornhill, London, after the 7th September.

ACHIMENES PICTA.

W. J. EPPS begs to announce that he has the finest and largest Stock of this valuable plant, which he can supply strong plants of at 5*s.* to 7*s.* 6*d.*; also the new and splendid blue Buddlea Lindleyana 5*s.*, Drymonia punctata 5*s.*, Aristolochia Gigas 5*s.*, Clerodendrum Cærifolium (a distinct and beautiful variety) 5*s.* Strong plants of nearly all the new Fuchsias sent out this year, 15*s.* per dozen.—Bower Nursery, Maidstone, Aug. 28th, 1844.

EXHIBITION OF LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London (removed from Walworth), by Appointment Florist to Her Majesty, begs to inform the Nobility, Gentry, and Amateurs that his extensive assortment of this most beautiful Lily, including the rare and splendid variety "speciosum" which is held in such high estimation by the Japanese, is now in flower, and will continue in perfection about a fortnight, and may be viewed every day, Sundays excepted. Admittance Gratis.

JOHN SLATER, Florist, Cheetham Hill, near Manchester, respectfully calls the attention of the Floricultural Public to his large and select collection of the following Florists' Flowers:—TULIPS, AURICULAS, POLYANTHUSES, CARNATIONS, and PICOTEES; catalogues of which may be had on prepaid application. 12 plants of named Auriculas, of different varieties, for 20*s.*, package included.

TO CALCEOLARIA GROWERS.

THE present being a good time to sow CALCEOLARIA SEED, the Advertiser begs to offer a few packets of his splendid New Spotted kinds, saved with great care, with printed directions to raise the young plants, at 5*s.* per packet. —J. Standish, Nurseryman, Bagshot.

INGA PULCHERRIMA. (Figured in "Paxton's Magazine of Botany" for August, 1844.)—Fine Plants of this extremely elegant and beautiful Exotic, with most of the other new and rare Plants of the season, may be obtained of the undersigned, at the following low prices:—

Inga pulcherrima, 7*s.* 6*d.*
Achimenes picta, 10*s.* 6*d.*
Æschynanthus Horsfieldii, 7*s* 6*d*
Amycia zygomeris, 7*s.* 6*d.*
Clerodendron splendens, 10*s* 6*d*
" squamatum, 5*s.*
Hindsia, or Rondeletia longiflora, 15*s.*
Epacris campanulata rosea (the finest selected from 1000 seedlings), 7*s.* 6*d.*
Habrothamnus elegans, 15*s.*
Tremandra Hugelii, 10*s.* 6*d.* to 21*s.*
Veronica speciosa, 5*s.* to 15*s.*
Erica elegans, fine and healthy, 15*s.*, 24*s.*, and 30*s.* per doz.
Drymonia punctata, 3*s.* 6*d.*
Phlox Van Houttei, (flowering plants), 2*s.*
Spirea Reevesiana, 5*s.*
Viburnum cotonifolium, 3*s.* 6*d.*

Also the following, in collections:

100 Cape Ericas of 100 distinct sorts, (including many fine sorts) 5*l.*
12 Epacrises of 12 distinct sorts, (including Campanulata rosea) 21*s.*
12 Azalea indica, of 12 distinct sorts, (including fulgens) 21*s.*

Thomas Jackson, Kingston Nursery, Surrey, August 23.

THE FINEST DUTCH HYACINTHS and OTHER BULBS DIRECT FROM HAARLEM.

YOUELL and CO. beg to inform their Friends and the Public they have just received their first Importation of the above in the finest possible condition, Catalogues of which can be had on application. They are enabled to offer "the finest Double or Single Blue, Red, White, and Yellow Hyacinths at 18*s.* per dozen."

Very fine ditto . . . . . 12*s.* per doz.
Fine ditto . . . . . 6*s.* "

And other Roots at equally moderate prices.

The Finest Norwich Black Baguet Tulips, 2*s.* each.

P.S.—Bulbs will be added as compensation for long carriage.

YOUELL and CO. are now sending to any part of the United Kingdom the undermentioned highly-desirable Plants, full particulars of which will be found in their former Advertisements.

FUCHSIAS—per post free.

12 Extra Fine varieties, 12*s.*, the Selection left to Youell & Co.
12 ditto ditto 21*s.*, the Selection left to the Purchaser, *comprising most of the new varieties sent out this season.*
50 Fine varieties . . 40*s.*, the Selection left to Youell & Co.
50 Extra Fine ditto . 60*s.*, the Selection left to the Purchaser

VERBENAS—per post free.

12 Extra fine Varieties, 6*s.*, the selection left to Youell & Co.
12 Ditto " 10*s.*, the selection left to the purchaser.

PANSIES. [Sent postage free.]

12 Fine Show Varieties, by name . . 10*s.* per dozen
12 Extra Fine ditto, do. . . 18*s.* "

Catalogues of which may be had on application.

CHRYSANTHEMUMS. (Sent postage free.)

Fifty of the newest best varieties by name, 12*s.* per dozen, for names and colours of which, see Advertisement of June 15th.

PETUNIAS—per post free.

Extra Fine Varieties, 12*s.* per doz., including Miller's Punctata.

PANSY "Lady Alice Peel" (for particulars of which see Advertisement of June 1, 1844), 3*s.* 6*d.* per plant.

ARAUCARIA IMBRICATA, in pots, 5 years old, 30*s.* per dozen, or 10*l.* per 100.

CEDRUS DEODARA, 3 ft. to 3 ft. 6 in., 10*s.* 6*d.* per plant.

N.B. All Orders above £2 are delivered carriage free to London or Hull, or plants added to compensate for the same.

Great Yarmouth Nursery, August 29, 1844.

TO THE LOVERS OF PANSIES.

S. WIDNALL, Grantchester Nursery, Cambridge, begs to inform his friends and the public that he has with great care selected his Superior PANSY-SEED, warranted to be all new of the present year, and which he can with confidence recommend. This being a favourable season for sowing, it will be advantageous to those who wish to ornament their gardens with this beautiful flower at a very cheap rate, as packets containing sufficient seed, with careful cultivation, to grow 500 plants and upwards may be had postage free at 2*s.* 6*d.* per pckt., or three packets for 6*s.*, upon receiving a post-office order.

T. and J. BACKHOUSE, Nursery & Seedsmen, York, beg to offer to the notice of the Public their following fine SEEDLING PANSIES:—

Yorkshire Eclipse.—"No. 1 is a large flower, of good form, white ground, blue purple upper petals, and broad margin of the same round the lower petals; the petals meet well above the eye; a good flower." 3*s.* 6*d.*

Beauty of Holdgate.—"No. 2 is your best flower; the eye large and intensely dark, ground light buff, belting purple, upper petals the same; a brilliant and striking flower." 3*s.* 6*d.* (See *Gardeners' Chronicle*, p. 280, for 1844.)

Earl of Zetland is a flower of excellent form, yellow ground, bronzy crimson upper petals, with broad belting of the same round the lower petals, which meets well above the eye; a distinct and very constant show flower. 3*s.* 6*d.*

Strong plants are now ready for sending out, postage free when three or more plants are taken. A remittance required from unknown correspondents.

TRUE HIGHLAND PINE.

JAMES GRIGOR, Nurseryman, Norwich, begs to call the attention of the Land Proprietors of England to this very desirable variety of Pinus sylvestris, which has been raised from seeds collected on the mountains of Strathspey, and of which he has strong plants ready to be sent out. For introducing this tree Messrs. Grigor, of Forres and Elgin, were awarded several premiums by the Highland and Agricultural Society of Scotland; and in that part of the country this Pine is rapidly superseding the common soft-wooded variety. For all economical purposes its chief merit consists in the hardness and durability of its wood; hence it is much sought after at present for railway sleepers. Pictorially considered, or as a landscape ornament, it rivals even the Cedar of Lebanon. Sir Walter Scott describes it as assuming much of "the bold and contorted figure of the Oak;" and in the last No. of the *Quarterly Review* it is recommended as a fit tree to be planted in churchyards and cemeteries.

Strong plants in pots, such as rabbits and hares will not destroy . . . . . 6*d.* each.
Ditto, not in pots, 18 inches high . . 20*s.* per 1000.
Ditto " 15 " . . 20*s.* "
Ditto " 1 foot high . . . 15*s.* "
Ditto " 3 years old . . . 10*s.* "

J. G. would recommend all who require them to furnish themselves immediately with these Pines, and to plant them forthwith. Spring planting is exceedingly hazardous; and when followed by such a season as was experienced during the commencement of the present summer, the young trees are sure to be killed.

Cedrus Deodara raised in the open ground, being the strongest plants yet offered in England, 10*s.* each. Araucaria imbricata, Pinus excelsa, Laricio, Austriaca, &c. &c. on reasonable terms.

PINE PLANTS.—Persons in want of the above have an opportunity of choosing from a particularly strong and healthy stock, warranted clean, at moderate prices. Apply personally or per post to W. Davis, Green-street, Marlboro'-road, Chelsea.

SPLENDID NEW SEEDLING CINERARIAS.—Strong Plants fit for autumn and winter flowering, saved from the very choicest sorts, selected from between 6000 and 8000 seedlings, comprising every shade of deep rich purple, dark and light blue, &c., 9*s.* per doz. Packets of Seed, selected as above, 2*s.* 6*d.* each. Also, strong plants of the following fine flavoured STRAWBERRIES:—

	per 100		per 100
Myatt's British Queen	6*s.* 0*d.*	Green Flesh Pine, small fruit, fine flavour	3*s.* 0*d.*
" Eliza	5 0	Elton Pine	2 6
Emperor, early variety from Keen's Seedling	3 0	Keen's Seedling	2 6

Applications, including post office orders, will be immediately and carefully executed.—Direct to Michael Brewer, Sen., Nursery, London-road, Cambridge.

TO THE LOVERS AND AMATEURS OF ROSES.
WOODLANDS NURSERY, MARESFIELD, near UCKFIELD, SUSSEX.

WM. WOOD and SON have the pleasure of announcing to their Friends that their newly-arranged CATALOGUE of ROSES is now ready, and may be had Gratis on application. It will be found to contain all the newest and best varieties in cultivation.

W. W. and Son take this opportunity of informing Amateurs that their extensive collection of autumnal flowering Roses are now in splendid bloom. Admittance daily, Gratis (Sundays excepted).—Woodlands, August 27.

MR. LYNE'S NEW SEEDLING GERANIUMS.

WILLIAM E. RENDLE has much pleasure in offering to the Nobility, Amateurs, and Trade the following new varieties of GERANIUMS raised by P. E. Lyne, Esq., the entire stock of which he has succeeded in obtaining.

		£	s.
Lyne's Princess Alice	each	1	1
Lyne's White Perfection	"	1	1
Lyne's Imogene	"	1	1
Lyne's King of Saxony	"	1	1
Lyne's Redworth	"	1	1
Lyne's Confidence	"	1	1
Lyne's Sappho	"	1	1

The whole set as above for six guineas. The usual discount to the Trade.

"Princess Alice" has received two seedling prizes in London. "White Perfection," first prize at Torquay, and the Gold Medal at Plymouth. "Imogene" is described in the *Chronicle*, June 24th, 1843. They all possess most desirable properties, and can be highly recommended as being first-rate flowers.

W. E. R. has been induced to offer the above at prices considerably lower than usually obtained for such valuable varieties, in hopes thereby to meet with a more extensive demand. Descriptions can be obtained on application.

Orders will be executed in strict precedence. Plants will be delivered in October next. Reference or remittance required from unknown correspondents. Plants will be added to compensate for carriage.—Union Road Nursery, Plymouth, Aug. 15

NEW AND RARE PLANTS.

W. JACKSON and Co., Nurserymen, Seedsmen, and Florists, have now the pleasure to offer the following Novelties:—

Cineraria Celestial, No. 1. . . . . 5*s.* each.
" Fairy, No. 2. . . . . 5*s.* "

See Dr. Lindley's opinion in the *Gardeners' Chronicle*, of April 6, page 216, under the letters, C. L. N. "Seedling No. 1, a bright blue. The flowers of this variety are rather small, but they are very abundant, and bright and beautiful in colour. No. 2, pure white centre, with the termination of the petals of a delicate azure blue. This is also an abundant bloomer with well-formed flowers, lively in appearance, and forms a distinct and desirable variety." Discount to the Trade on the above when six plants of each are ordered.

Boronia ledifolia, 5*s.*; Chorozema triangularis, 5*s.*; Epiphyllum, Conway's Giant, 3*s.* 6*d.* to 5*s.*, large; E. Russellianum, 2*s.* 6*d.*; Gastrolobium spinosum, 5*s.*; Gompholobium polymorphum luteum, 5*s.*; Hydrangea Japonica, 2*s.* 6*d.*; Mirbelia speciosa, "Lobliges" 5*s.*, Oxylobium acutum, 5*s.*; Pimelea spectabilis, 2*s.* 6*d.*; Tunbergia chrysops, 7*s.* 6*d.*; Veronica speciosa, 2*s.* 6*d.* to 7*s.* 6*d.* each, large.

W. Jackson and Co. beg to state that their 60 beautiful Seedling Calceolarias, selected from upwards of 2000, will be sent out early next Spring, a descriptive Catalogue of which will be printed. Railway communication to all parts of the kingdom. A reference from unknown correspondents is respectfully solicited.—Cross Lanes Nursery, Bewsale, Yorkshire.

EARLIEST STRAWBERRY in CULTIVATION. —Strong Plants of the "PRINCESS ALICE MAUDE" STRAWBERRY, which has proved itself to be the earliest grown in this country, are now ready to be sent out at 30*s.* per 100. As an Early Strawberry, it has taken the First Prize at all the Horticultural Exhibitions in the early part of the season. Also Plants of the "British Queen," "Deptford Pine," "Prince Albert," and all the leading kinds. To be had of Messrs. Warner & Warner, Seedsmen, 28, Cornhill, London.

AURICULA SEED from Stage Flowers, to be had in Packets at 2*s* 6*d.*, of W. J. Nutting, Seedsman, 46, Cheapside, London.

SMITH'S FIELD and GARDEN SEED-DIBBLE, or HAND-MACHINE, for depositing all kinds of Seed on the various Soils, with the greatest accuracy and despatch.—This Machine is so simple in its construction and operation as not to be liable to get out of order, and can be used by men or women. It is easily set, so as to deliver the exact quantity of Seed intended to be planted into each hole made by the Dibble, at one operation, without any further care than supplying it with Seed, by the person using it, and will plant Turnip and Mangold Wurzel Seed, Wheat, Barley, Peas, and all kind of Garden Seeds. In Tin, 1*l.* 10*s.* each; or with Copper Box and Tube, 1*l.* 15*s.* each. Commission allowed to Agents.

These Dibbles may be obtained of Messrs. Cottam and Hallen, 2, Winsley-st., Oxford-st., London, through the agency of the principal Agricultural Implement Sellers in the United Kingdom; or from the Inventor, by letter, to his address, inclosing a Post-office order for the amount.—Richard Smith, Upper Hall, near Droitwich, Worcestershire.

SUPERB HYACINTHS, ANEMONES, TULIPS,

&c., just received from the most celebrated growers in Holland, and will be delivered free of all expenses at the railways, packet offices, or in any part of London, at the very moderate prices annexed.

Messrs. SUTTON and SONS, Reading, Berks, respectfully present the above as a select list of the sorts most worthy of cultivation, and recommend early application, while they possess fine roots of every variety.

N.B.—Parcels delivered free to any part of London, and properly packed for conveyance to any distance.

THE NEW SUPERB SEEDLING PICOTEE,

"BURROUGHES'S DUKE OF NEWCASTLE."

YOUELL & CO. have much pleasure in announcing they will send out for the first time the above splendid light-edged purple Picotee, raised by the Rev. J. Burroughes. It is guaranteed to surpass any Purple Picotee that has yet been raised. Without commenting further upon its superiority, Y. and Co. beg to refer to a report in a late No. of the *Gardeners' Chronicle*, as follows:—

"The *Duke of Newcastle* is a flower of first-rate properties; it is a light-edged purple; the petals are large, and of good form and substance; even on the edge; the colour unbroken; the pod good, and with less disposition to bar than is common." It obtained the first prize, as the best seedling, at the Norfolk and Norwich Horticultural Exhibition. Price 21*s.* per pair, and will be sent out the latter part of next month. The stock being limited, to prevent disappointment early orders are respectfully requested. Y. & Co. will also be enabled to supply at the same time the following superb Picotees, raised by the same gentleman, all possessing first-rate properties, and having been exhibited and obtained first class prizes at several of the metropolitan Exhibitions of the present year. They are as follows:—

Burroughes's	Mrs. Benyon, Red Picotee	7*s.* 6*d.*
,,	Lady Alice Peel, Rose Picotee	7 6
,,	Miss Jane, Purple Picotee	7 6
,,	Miss Bevan, Red Picotee	7 6
,,	Enchantress, Scarlet Picotee	5 0

CARNATIONS AND PICOTEES.

Y. and Co.'s collection of this beautiful tribe of flowers will be found the most extensive and select in Europe, comprising every known variety of merit. The plants are remarkably strong and healthy, and will be ready for sending out to any part of the United Kingdom and the Continent the latter part of September, at the following prices:—

				£	s.	d.
12 pairs extra fine and very superior first-class Show Flowers				2	10	0

The selection being left to Y. and Co.

Great Yarmouth Nursery, August 29, 1844.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

THE following Articles, manufactured in Slate for Horticultural purposes, may be seen in use at Worton Cottage, upon application to the gardener (Sundays excepted).

Tank Covers	Bottoms for Frames
Cisterns	Boxes for Balconies and Verandahs
Shelves	
Garden Edging	Orange Tubs, Flower Boxes, &c.

EDWARD BECK will be happy to answer any inquiries, either personally or by post.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c. by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & C. have also to state that at the request of numerous friends they are now making their Boilers of Iron as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & Co. beg to inform the Trade that at their Manufactory in New Park st., every article required for the construction of Horticultural buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field, and Garden Fences, Wire Work, &c. &c.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metalic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

HORTICULTURAL BUILDING & HEATING by HOT WATER.

J. WEEKS and Co., ARCHITECTS, &c., Gloucester-place, King's-road, Chelsea, Hothouse-Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry, that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS, ANTONY GIBBS AND SONS, LONDON; WM. J. MYERS AND CO., LIVERPOOL;

And by their Agents,

COTESWORTH, POWELL, AND PRYOR, LONDON; GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.

47, Lime-street, Aug. 30, 1844.

MANURES.—The Readers of the *Gardeners' Chronicle* must have noticed the complaints constantly made there of the Adulterations of Manures, and which are now carried on to a fearful extent.

The Advertiser, a Broker of the City of London, and in daily communication with several scientific Chemists, calls the attention of the Nobility, Agriculturists, and Farmers to his method of supplying Manures, by which a genuine article is secured. Each article is Analysed, and the Analysis forwarded to the purchaser, who can by this means obtain redress should the article differ from the Analysis.

Terms, Cash and one per cent. commission for buying and forwarding.

A register will be kept of the Analysis of every cargo of Guano imported into London that is brought in the market.

Price-current, London, Aug. 30, 1844:—

WM. NORTHCOTT, 13, Rood-lane, Fenchurch-street.

TO FLORISTS AND ADMIRERS OF FLOWERS.

BRAIN'S CONCENTRATED LIQUID GUANO, for the Garden, Shrubbery, Hothouse, and Conservatory.

This preparation is peculiarly adapted for the development of Flowers, furnishing them with the materials (in a soluble form) out of which they weave their delicate tissues and elaborate their beauteous colouring. It has no unpleasant smell, is easily applied, and thus recommends itself, either for the Garden or Drawing-room.—Price 1*s.* 9*d.* per quart Bottle, and may be had of WM. JACKSON, late Geo. Butler, 93, Cheapside, corner of King-street, and most respectable Druggists and Seedsmen, with full directions for use inclosed.—Works, Thomas-st., Stamford-st., Blackfriars rd.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient Protective Material to Plants, and is now in use at the Royal Horticultural Society's Gardens, Chiswick. It can be had of any length, 32 inches wide, at 1*d.* per foot, super. A discount to the trade. THOS. J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

GYPSUM, &c.—Pure Gypsum (Sulphate of Lime) for Compost Heaps, Urine Tanks, Stables, &c.; also Sulphuric Acid, Guano (foreign and Potter's), Rape Cake and Rape Dust, and all other Manures, may be had of the Undersigned. Synopsis of Prices, and mode of use, on application.

MARK FOTHERGILL, 40, Upper Thames-street.

HATCHER'S BENNENDEN TILE-MACHINE. Manufactured and Sold only by COFTAM and HALLEN, Engineers, Agricultural Implement Makers, &c., 2, Winsley-street, Oxford-street, London.

This is the most efficient Machine that has been invented for the purpose of making Drain Tiles. Any shaped Tile can be made by merely changing the die, which can be done in a few minutes. It requires but few hands, viz., one man and three boys. With this amount of labour, the product of a day of 10 hours is as follows, viz.:—

1 inch diameter of Tile,	11,000	1¾ inches diameter of Tile,	5,000
1¼ ,, ,, ,,	8,000	2½ ,, ,, ,,	3,200

The Machine is movable down the drying-sheds, so that it requires no extra boys to carry the Tiles, nor are shelves required in drying. It has been in full operation for upwards of four months at Hempstead Park, near Cranbrook, Kent. No charge made for Patent dues or licence. The purchase of the Machine includes free use of it.

DRAINING OF LAND.

THE A LEVEL, designed for the Use of Workmen, in preserving a uniform fall in Drains and Water-courses. In consequence of the approval expressed and the demand made for these Levels at the recent Southampton Show, Mr. BAILEY DENTON has arranged with an eminent London Mathematical Instrument Maker to make them in any number required. Price 30*s.*

This Level is as accurate as a spirit-level, and so simple, that the workman unable to read can use it with facility. When closed it forms a 5 feet staff.

Orders addressed to MR. DENTON, Land Agent, 9, Gray's Inn-square, London; or to MR. CHARNOCK, Wakefield, Yorkshire, will insure a perfect instrument.

HOTHOUSES, CONSERVATORIES, &c., made and fixed Complete in all parts of the Kingdom. One, two, and three-light Cucumber and Melon-Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from 1*l.* 8*s.* Garden-Lights made and glazed from 1*s.* per foot, at JAS. WATTS' Sash Manufactory, Claremont-place, Old Kent-road. *** Reference given.

MESSRS. PROTHEROE AND MORRIS have received instructions from T. and C. LOCKHART not to proceed with the Sale as advertised in the *Gardeners' Chronicle* of the 10th and 17th inst.

T. AND C. LOCKHART, FLORISTS and SEEDSMEN, 156, Cheapside, London, having dissolved Partnership with Mr. ANDREW DUNCAN, beg to inform their Customers and the public generally that they will carry on their business as usual at the above address. Their Catalogue of BULBS and FLOWER-ROOTS for the present season has just been published and will be forwarded, post-free, on application.

NURSERY STOCK, KING'S ROAD, CHELSEA.

MR. KIRKE respectfully begs to announce that he has received instructions to Sell by Auction, on the premises, (late The American Nursery) King's Road, Chelsea, on Wednesday, September 11th, at 11 for 12 o'clock, by order of the proprietor, the ground being required for other purposes, the Valuable Collection of CACTUSES, GERANIUMS, CAMELLIAS, ORANGE, LEMON, and CITRON TREES; ALOES, FUCHSIAS, YUCCAS, CHRYSANTHEMUMS, AZALEAS, and SUCCULENT PLANTS; the whole in pots, and arranged in small and large lots to suit the convenience of purchasers; GREENHOUSES, &c. &c.—May be viewed two days prior to sale. Catalogues had on the premises; of Messrs. DIXON and Co., Covent Garden; of Messrs. T. and C. LOCKHART, Seedsmen and Florists, Cheapside, City; and at the Offices of the Auctioneer, 29, Brompton-row, Brompton.

TO BE LET, on Lease of 10, 15, or 20 years, from Michaelmas next, the RECTORY FARM, LITTLE GRANSDEN, containing 400 acres, of which about 250 acres are old and 150 new land; all under-drained.—Apply to the Rev. F. NORRIS, Gransden Rectory, near Caxton.

FARMS TO BE LET ON LEASE.

TO BE LET ON LEASE, HOLMSTEAD FARM, consisting of 238 Acres of Excellent Arable, Pasture, Meadow, and Wood Land, free of Corn Tithes, with a good Farm-house, convenient Out-buildings, and walled-in Cattle-yards well supplied with water. Also HULKS FARM, comprising 185 Acres, with a Capital Newly-erected House and Farm-buildings. There are about 60 acres of Woodland, which may be had with this if required.

The above Farms are situated in the parishes of Cuckfield and Bolney, Sussex; and are about 15 miles from Brighton, skirted by the London turnpike-roads, and 3½ miles from the Haywards-heath Railway station. Possession may be had at Michaelmas.

For further particulars, apply to A.C., 13, Charles-street, Middlesex Hospital, London; or at Holmstead.

STOCK FARM.

TO BE LET, at Michaelmas next, a very compact Farm, with convenient Buildings, consisting of 445 acres of Arable, 98 Pasture, and 138 of Downs Land, in a good state of cultivation, and part of it may be entered upon immediately.—For further particulars apply to Mr. SAMUEL DRUCE, Ensham, near Oxford.

TO GARDENERS, NURSERYMEN, AND OTHERS.

TO BE LET, with immediate possession, within 20 miles of London, a small NURSERY, and PUBLIC-HOUSE doing a good business. The Nursery is well stocked with choicest American Shrubs, Fruit, and other Trees; is situated within a few minutes' walk of a railway station. Every particular can be procured by application to Mr. KERNAN, 4, Great Russell-street, Covent Garden; and Mr. NEAL, Nurseryman, Wandsworth Common. No person without capital need apply.

BRIGHTON FLORAL and HORTICULTURAL SOCIETY.—The Exhibition of the above Society will be held at the Town Hall, on Wednesday, Sept. 18, 1844, when, in addition to the premiums offered by the Society, there will be two Prizes given for Grapes—one a handsome Silver Dessert Knife and Fork and Spoon, in case, for the best dish of Grapes of any colour, not exceeding 4 lbs. weight; the other a Prize of two large Silver Table spoons, for the best dish of Black Grapes, not exceeding 4 lbs. weight. The above is open to all England. Entrance, 2s. 6d. each. Persons who intend to exhibit are requested to send their names and address on or before the 15th Sept. to the Secretary, Mr. R. COLLINGS, Duke-street, Brighton.

The Gardeners' Chronicle.

SATURDAY, AUGUST 31, 1844.

MEETINGS FOR THE FOLLOWING WEEK.

TUESDAY,	Sept. 3	Horticultural	3 P.M.
FRIDAY,	Sept. 6	Botanical	8 P.M.

WE resume the consideration of HYBRIDISING. Some of its actual results have already been pointed out (p. 459); others will suggest themselves to any one acquainted with gardening. Let us now consider what further may be hoped for.

What further? Why, we have only stepped over the border, and the whole field of hybridising lies widely spread before us; its boundaries are lost in the horizon, and we shall find them still receding as we advance.

In directing attention to this part of the subject, we do not here propose to include the plants cultivated by the farmer, but to confine ourselves strictly to garden plants. What agricultural applications hybridising may have will be found hereafter in the other department of our Journal.

The ends which it is hoped to gain by all operations directed towards improving the races of plants are many.—To increase the size of flowers, To improve their colour, To approximate their form to some assumed standard of perfection, To enlarge the foliage, as in esculents, To render tender plants hardy, To make barren races fertile, To improve flavour, by changing acidity or austerity into sugary matter, To exchange early for late varieties, are all results that have been gained by hybridising, and which, therefore, may be gained again. We propose to consider each of these points separately.

How far the *size of flowers* may be thus increased can be judged of from the Rose, the Dahlia, the Fuchsia, Pansy, Pelargonium, and Cactus. All these plants are, in their wild state, small-flowered; cultivation alone has increased them greatly, but crossing has rapidly carried it further. By inoculating the common Heartsease with the large-flowered Pansy of the Altai mountains, a degree of vigour was infused into the former which we could not have hoped to obtain by any other means. In other cases, as in that of the Dahlia, by observing the first symptoms of a tendency to enlarge in the natural seedlings, and then crossing the best of them, the tendency has received an immediate impulse, which has by degrees brought about the enormous flowers we are all familiar with. The flowers of Cereus speciosissimus were inoculated with the pollen of Cereus grandiflorus by Messrs. Davis and Co., of Wavertree; and the *immediate* result was a seedling from C. speciosissimus, whose flowers were 10 inches in diameter.

In prosecuting this branch of improvement, care should be taken to select the finest possible flowers on both the father's and mother's side, and to render them unnaturally large by destroying all their neighbours. The plants, too, should be in the most robust health; for we may be sure that no point of constitutional vigour is to be neglected in the parents when a general and permanent increase of it is desired in their offspring. It is moreover conformable to the experience of the late Mr. Andrew Knight, that even the plumpest seeds are more likely to bring a fine seedling than the weaker.

Among the commoner plants to which attention might be drawn under this head, are not merely those which, like the Verbena, the Petunia, and the Cactus, are already in the florists' hands, but others, that have yet gained little attention. Take the Clematis, for example: our wild Traveller's Joy is unknown in gardens, although it has a fine foliage, and a great vigour of growth. Why not cross it with C. florida, or Viticella, or even Flammula? Clematis Viticella is a bad grower, but has beautiful blossoms; it, too, may certainly be improved by some of the finer species. Then, again, the Minorca Clematis, with its fine speckled blossoms, is tender, and flowers very late; what would be the effect of an intermixture of it and C. montana, which is so hardy, and flowers so early? What a noble plant, too, is C. azurea to work with! It must not, however, be crossed with any of the red species, for reasons that will be explained hereafter. Can anything be more worthy of attention than this charming genus, which nobody seems to have thought about? To those whose leisure enables them to prosecute such an inquiry we may state that in all probability the species of Clematis will cross most readily in the following order, viz.—1. *C. flammula, vitalba* and *cylindrica*; 2. *C. florida, azurea, viticella, balearica,* and *montana;* but there is no apparent reason why they should not all also intermix, in skilful and patient hands.

Another important race of Climbers are the Honeysuckles. The flowers of our common Honeysuckle are little more than an inch long; but those of the beautiful Tuscan species (Caprifolium etruscum) are twice as large, and in the Caprifolium longiflorum of China the blossoms are full three inches in length. Here are the best opportunities for an improvement of one of our most favourite plants.

Nor do we regard the case of the common Jasmine as hopeless. It is true that it does not produce its berries with us; but if it were kept under glass, and artificially fertilised, it probably would do so. Why not intermix it with the beautiful species from the Azores. It would, in all probability, give its hardiness to that plant and receive in return a finer foliage and more abundant bloom; or, at least, it would hardly refuse to mingle with the Catalonian Jasmine, which is so like it, and then our cottages might be covered with plants as beautiful as those of Barcelona and Italy.

The Laurustinus is another plant entirely neglected by growers of new plants, and yet there is no reason why its flowers should not become as large as those of the Guelders Rose—itself an artificial production. What would be the effect of inoculating the finest of the varieties of the Viburnum opulus, the parent of the Guelders Rose, with the Laurustinus? Either, we should expect, an evergreen Snowball-tree, or a Snowball Laurustinus; or, at least, a considerable enlargement of the flowers of the latter; or, may be, the issue would be a hardier Laurustinus than we had before. But that is beside the present question, which we confine to an enlargement of the blossom.

The double Japan and Chinese Cherries (Cerasus japonica and sinensis), among the finest of our spring shrubs, would be infinitely improved if the size of the common Cherry could be communicated to them; and there is no apparent reason against it. And in like manner the little Dwarf Almond (Amygdalus nana), not now much grown, though a very pretty bush, might, and most likely would, be readily improved by a mixture with the common Almond, or still better with that magnificent variety called in the gardens Amygdalus macrocarpa.

If we turn from shrubs to herbaceous plants, there is the same abundance of materials on which to work. Why not attempt to mix Tropæolum brachyceras or canariense with the common Nasturtium? or the beautiful Hypericum Coris with H. androsæmum, or H. erectum with calycinum? or the annual Larkspurs with Delphinium grandiflorum? or the whole race of Dianthus, including the Indian Pinks and Sweet Williams, with the Cloves and Carnations? or the gay Sea Lavenders with such plants as Statice arborea and Dickinsonii? or, finally, our wild Buttercups with the gaudy Ranunculus of the florists?

In all these suggestions there is nothing in the least contrary to probability; the plants that are adverted to are all of common occurrence, and easy for any one to operate upon—indeed they have been selected for that reason; and they offer an abundant reward to skill and patience.

The other points above alluded to must be considered hereafter.

DISEASES OF PLANTS.—No. II. *See p.* 131, 1844.

[MOSSES, LICHENS, &c.]

BEFORE we enter on the consideration of those morbid appearances which are produced in plants by the agency of Fungi, we proposed to consider how far other cryptogamic species are injurious. In the few cases in which they are so, it is not by the production of any particular disease, but by simply overrunning the leaves and branches, and thus blocking up the stomata, preventing the proper influence of light, keeping up an unnatural moisture, or affording a nidus for the development or preservation of injurious insects. Several species of Mosses and Marchantia, Vaucheria terrestris, and Microcoleus, &c., are very noxious weeds, especially in the case of small and tender plants preserved in frames, and the delicate seedlings of Ferns are frequently destroyed by Palmella botryoides and others of the smaller terrestrial algæ; and they are in some measure the more annoying to the cultivator, because they are extremely difficult of extirpation. If the gardener complains sometimes that his lawns are spoiled by many of the more common Mosses, though in certain situations they add very much to the beauty of his close-shaven sward, the farmer with greater reason laments over his pastures overrun with Moss and Lichen till they are all but useless.

In these cases, however, they are injurious simply by encroaching on the ground which was destined for more useful tenants, and however hurtful occasionally, they cannot be regarded in the light of diseases. In damp situations I have seen trees much infested with the common green Chlorococcus, an Alga of the most simple construction, not only the trunk and branches being covered as with a green wash, but the leaves themselves becoming entirely coated with it, at once to the great disfigurement and injury of the plants thus invested. But the injury produced does not arise from the rootlets penetrating into the tissues and nourishing the parasites at their expense, with the juices intended for the support of the mother plant, but merely as a coat of any other coloured wash, by clogging up the pores and hindering a due assimilation of the sap. In hot countries the leaves of many phœnogamous plants, and the fronds of the more rigid Ferns, are frequently overrun with various species of Moss and Jungermannia, but it is principally the older leaves, whose functions are nearly past, that are thus infested; and it is possible that in some cases they may even be of use in retaining a certain quantity of moisture about them. In these cases, again, there is not the slightest penetration of the rootlets into the tissues of the plant on which they grow. It is scarcely necessary to mention that the Mosses which so often and to such an extent adorn the trunks of our trees, grow upon them, merely because the cracks in the bark and the mouldering surface itself affords a fit soil for the germination of their spores and the support of the full-grown plant. Lichens vegetate on the hardest bodies, as granite, quartz, and glass, and not unfrequently the same species which flourish on the hardest rocks abound also on trees. There can be no question, then, in such instances, of real parasitism. There may, indeed, be a few cases amongst those Lichens which are produced on tropical leaves, in which there is a certain connection between the tissues of the matrix and parasite, for several of these approach very nearly to Fungi; and some of the cortical species (also allied to Fungi), common both to the new and old world, are certainly very intimately connected with the bark, without, however, destroying the subjacent tissues; yet, in general, it may be said of cryptogamic plants, with the exception of Fungi, that they merely choose other plants as a base on which to rest their fronds, without, in the majority of cases, having any but the most superficial union. In the officinal barks, for instance, those specimens which are covered with healthy Lichens abound in the peculiar principles which make them valuable as medicines, while those portions which are covered by the beautiful Hypochnus rubro-cinctus, and other Fungi, are totally worthless, because their tissue has been penetrated and preyed upon by the mycelium, or in other words, the delicate rootlets of the Fungi. Still, it must be confessed that where the growth of trees is slow from an ungenial soil, or where the atmosphere is such as to encourage the development of Lichens on the smaller fruit-bearing shoots, their fertility is often very much injured. This does not appear, however, to be always the case. In the deep recesses of large woods very vigorous trees are often found much covered by Lichens, and Meyen tells us, that in the Riesengebirge and the Harz mountains, the Firs in the neighbourhood of little waterfalls are absolutely covered with Mosses and Lichens, and yet grow with the utmost luxuriance; and it is notorious that in tropical woods, a single stem in the most vigorous health often bears upon its trunk and branches a whole garden of Ferns, and other false parasites, without the slightest injury. Most gardeners, however, must know by experience that old fruit-trees which have become covered with the common yellow Lichen (L. parietinus), and scarcely produce any fruit, will, if carefully cleaned, recover sometimes much of their former vigour, sending out new shoots, and producing abundance of excellent fruit. In such cases, it is probable that the Lichen prevents the proper action of the light upon the tender bark of the terminal shoots, and thus weakens the buds, or by encroaching on the buds themselves, destroys them. This may not always be the case, and trees almost smothered with Moss and Lichen may be excellent bearers; but if so, it is probable that this arises from the strength and healthy state of the roots, and the genial nature of the soil, which makes the buds so vigorous that the new shoots outstrip the Lichen. Where it is thought necessary to prevent the growth of Lichens and Mosses on trees, the best method, perhaps, is to use a wash of quicklime, which has the advantage of destroying a large number of insects, if it does not at all benefit the tree directly. Except in the case, however, of fruit-trees, this indirect benefit hardly compensates for the loss of picturesque effect; and to the more attentive observer few objects, even amongst phænogamous plants, present more beautiful forms, or more admirably blended colours, which in some cases are of great brilliancy, than many of these humble productions, which so often entirely escape the notice of the casual eye.—*M. J. B.*

ON THE PRESERVATION OF FRUITS.

THE preserving of fruits forms an important part of the art of gardening, but it is in very few places that sufficient attention is paid to it, for in many gardens, after the fruit has been gathered, and that not in the most careful manner, it is carried into the fruit-room and there laid upon the shelves, sometimes covered with hay or straw, and sometimes exposed to the atmosphere of the house. Nothing can be more injurious to their keeping than being subjected to all the currents of air to which the house or room may be exposed.

Many contradictory opinions are given on this subject by different authors, but they all seem to arrive at this conclusion, that the prevention of excess of air in the room where fruits are kept, is the most important point to be attended to, and is generally the least regarded. Some persons recommend packing the finest fruits in earthenware jars amongst moss, and excluding

the air by stopping up the mouths of the vessels, and then plunging them a foot deep in dry sand, in preference to keeping them on open shelves in the fruit-room; but moss is objectionable, as it communicates a musty flavour to the fruit. Sand has been adopted with success in the following manner:—Having procured some air-tight vessels, of any description or size, then put in a layer of sand, and a layer of Apples or Pears alternately, until the vessel is full; the sand must be well dried before being used, either by exposure to the sun or by fire-heat. After the vessel is full the lid should be perfectly secured to prevent the admission of air, by means of a piece of oil-cloth or leather, made larger than the rim of the vessel, so that it may lap over three or four inches; then take a piece of strong string and tie it after the manner that housekeepers tie up their pots of jelly. Some prefer sealing the lids, but this is attended with a disadvantage, as the covering is required to be removed every time that fruit is wanted. After the vessels are all properly secured, they should be placed in a cool airy room or cellar, with a temperature varying from 32° to 40°. There should be vessels of different sizes, for the different varieties of fruit, and on no account should more than one sort be put in each vessel, as some kinds ripen sooner than others. Each vessel should be numbered to correspond with a list of the sorts, so that it can be easily got at when wanted.

If there is not the convenience of a room, the vessels containing the fruit may be plunged in the open ground to the depth of from four to five feet; there they will be secure from any sudden change in the atmosphere. After the hole is made, put in a layer of charcoal, and then insert the vessel, filling up the intervening space with charcoal, pressing it firmly with the foot; the charcoal will be found to keep all cool and clean.

Amongst the numerous materials employed in preserving and packing Apples and Pears, I am not aware that charcoal has been employed; but it will be found upon trial to answer as well, if not better, than sand, as it is not so liable to absorb moisture. In the use of charcoal instead of sand, I would recommend it to be ground fine and sifted over the Apples as they are laid in, which should, in all cases, be done in the most careful manner, as the least bruise in one will spoil all.

The late Mr. Knight, in one of his papers in the "Hort. Soc. Trans." says, "The most successful method of preserving Apples and Pears, which I have tried, has been placing them in glazed earthenware vessels, each containing about a gallon, and surrounding each fruit with paper; but it is probable that the chaff of Oats, if free from moisture or any offensive smell, might be used instead of paper, and with much less expense or trouble. These vessels being perfect cylinders, about a foot each in height, stand very conveniently on each other, and thus present the means of preserving a large quantity of fruit in a small room. If the spaces between the top of one vessel and the base of another be filled with a cement, composed of two parts of the curd of milk and one of lime, by which the air will be excluded, the later kinds of Apples and Pears will be preserved with little change in their appearance, and without any danger of decay, from October till February and March. A dry and cold situation, in which there is little change of temperature, is best for the vessels. I have found most Pears to be greatly improved by their being taken from the vessel about ten days before they are wanted for use, and kept in a warm room; for warmth at this, as at all other periods, accelerates the maturity of the Pear." Here, then, we have the following important information, viz., the exclusion of air, and a low temperature, as the principle for keeping or retarding the ripening of fruit, and warmth for bringing it to maturity. The latter may be done at any period after the fruit has been gathered, by placing the vessels in a temperature of 60° to 70°.

I, however, differ from Mr. Knight in the use of Oat-chaff and paper; in the first case, it is difficult to procure the chaff of Oats free from moisture or an offensive smell, of which the fruit is sure to partake; and paper, except what is generally termed silk-paper, imparts a disagreeable flavour to the fruit. In fact, paper should not be used at all, for it is apt to damp and destroy the fruit in whatever situation it may be placed.

The fruit-room should be fitted up exactly like a pair of bed-room drawers, of some hard wood. Fir, being apt to spoil the flavour of the fruit, should never be employed. These drawers must be made to fit as tight as possible, in order to exclude air, and should be numbered in regular order, to correspond with a list which should always be kept in the fruit-room. When all is ready for the reception of the fruit, place in each drawer a quantity of fine dry sand or charcoal, then a layer of Apples, until the whole is full; then shut up the drawers and let them remain until the fruit is required for use; if any are wanted let them be taken out some days previously and placed in a warm room, or hothouse, until they are fit for the table. The advantage of such a fruit-room must be obvious to every practical gardener. First, we have the entire prevention of air, which is allowed by all to be injurious to their preservation; second, the sand or charcoal checks the evaporation of the fruit, thus preserving their flavour, and at the same time any moisture yielded by the Apples is absorbed by these materials, so that the Apples are kept dry and mustiness is prevented. The fruit preserved in this manner will be found as fresh in May and June as when first put in.—*J. McIntosh.*

ENTOMOLOGY.

The Seven-spotted Lady-bird, named *Coccinella septem-punctata.*—No one connected with the country, or who takes the slightest interest in the cultivation of a flower, can be ignorant of the services rendered to him by the pretty lady-birds, which have even escaped the sad prejudices of our nation as regards insects, so that children caress these handsome and most useful creatures in England, and in France they seem to be equally esteemed, being called *Vache à Dieu*, and *Bêtes de la Vierge*, cows of God, and insects of the Virgin. It seems, however, that many persons are unacquainted with the early stages of their existence; and as this has led to the fatal error of destroying the larvæ, which are amongst the most valuable aids the cultivator has, in keeping under the aphides, it becomes very important that the farmer, as well as the gardener, should be at once enabled to distinguish his friends from his enemies.

If we examine the underside of the leaves of Turnips, Hops, or any plants, where they are greatly infested with plant-lice, we shall be sure to find little clusters of orange or buff-coloured eggs (fig. 1) deposited close together on their ends, and considerably resembling those of the White Cabbage butterflies at the first glance, but they are very different when magnified; they are more elliptical, fleshy, and smooth, not being sculptured as those of the papilios are. The first brood hatches in May, when the pearly empty shells alone remain, and the little black animals issuing from them run over the leaves in search of food; at this time they are rough with hairs, and have six short strong legs; as they grow they change their skins, and eventually those of the largest species (C. 7-punctata) attain the length of five or six lines (fig. 2); the larva now has a slate-coloured skin, smooth but dull; the body is attenuated towards the apex, and extends far beyond the six black sprawling legs, so that it looks like a little gay alligator, which it likewise resembles in its voracious and carnivorous habits. The head is rather small, trigonate, and of an orange-colour, but black at the base, the little black eyes and antennæ being scarcely visible, but the mouth is well developed; the black palpi are comparatively large, and the two rust-coloured jaws sharp; the 1st thoracic segment is broad, of an orange-colour, with a black spot on the centre and one on each side; these are covered with rough tubercles terminated by bristles; the two following thoracic segments are broad, with spined black tubercles, and the nine abdominal ones are shorter, each having six spiny tubercles forming as many lines down the back and sides; they are very black, excepting the lateral ones on the 4th and 7th segments, which are bright-orange; the six legs are shining black, tapering, bristly, and terminated by a single claw. When these larvæ are full fed, they attach their tails to the leaf on which they lived, or seek some more sheltered situation in the bark of trees or under paling, especially those which are to rest through the winter, and pass into pupæ (fig. 3), which are somewhat oval and convex, black, variegated with yellow and orange; in this state in spring and summer they remain only 12 or 14 days—probably less in fine weather—when the skin bursts down the thorax, and the perfect lady-bird issues forth, of a pale yellow or ochreous colour, gradually assuming its natural tints of red and black, as it is exposed to the light and air.

There are upwards of 30 different species,* besides endless varieties of these useful and beautiful little animals inhabiting this country, one of the largest and most abundant being the lady-bird with seven spots, called by Linnæus Coccinella septem-punctata. It is oval, convex above, flat beneath, shining, and black; the antennæ are short, clavate, and 11-jointed; the jaws are strong and sharp, and the palpi large;† upon the head are two white dots, and there are two larger ones on the anterior angles of the thorax; the elytra are bright brick-red, with seven black spots, the 1st upon the base of the suture, the others forming two triangles; wings two and ample; the tarsi are 4-jointed and terminated by two claws (fig. 4).

There is a smaller species, named C. dispar, or C. bipunctata, often with two black spots on the red elytra, but sometimes black with red spots, which is equally abundant. The lady-birds are probably to be found during the whole year, as they winter under bark, in chinks of posts, paling, &c., and are seen in the earliest days of spring, if the weather be fine, and late in the autumn also. I have met on the sea coast in September with immense numbers, which I imagine had deserted the Hop-grounds and were about to offer their good services to the farmer in his Turnip-fields.

The vast quantities of aphides which the larvæ of the lady-birds destroy cannot be calculated, for they seem never to cease from feeding, except when they are moulting, and consequently increase very rapidly in size; and the ladybirds themselves are equally active. One sees these pretty scarlet animals running over the plants until they meet with an aphis, which they immediately seize with their broad feelers, and keep squeezing out the saccharine contents, until the crumpled skin alone remains; they then attack another, and will thus proceed until, leaf by leaf, the plant is freed from this disagreeable and destructive blight. I was astonished to see how rapidly one of these little creatures picked up and ate the small apterous aphides on a Pelargonium, at the rate, I should say, of three or four in a minute; and a pair which I placed upon two Pelargoniums, cleared off all the plant-lice, with which they were greatly infested, in the course of 24 hours, so completely, that I could not find a living specimen. On the Continent their valuable services are so well understood, that the lady-birds are collected and placed upon Rose bushes, &c. to extirpate the aphides.—*Ruricola.*

Home Correspondence.

The Hyssop of Scripture.—At p. 556 appears an interesting article on the Hyssop of Scripture. Its object is to prove that the Caper-plant is that Hyssop. Professor Royle has argued very ingeniously, and it is not my present purpose to dispute his general conclusion. I only wish to make a few observations on the last point of resemblance adverted to by the Professor. He seems to have found most difficulty in explaining how the Caper-plant would yield a stick long enough for a man to lift a sponge upon it to our Blessed Saviour's lips. Now, I am of opinion that there is no necessity for supposing that the stick was of Hyssop; indeed, it appears plain to me that it was not. St. Matthew and St. Mark both say that the sponge was put upon a reed; St. John alone mentions that they put it upon Hyssop. But a very obvious way of reconciling both, is to suppose that the sponge was placed among the small twigs of a bunch of Hyssop previously tied to a reed, and so lifted up to our Blessed Saviour's mouth. The bunch of Hyssop would not only safely support the sponge, but its twigs and leaves would receive the vinegar which might drop from the sponge, and prevent its running down the reed, and annoying the soldier who held it. St. Augustin is clearly of this opinion; for, having previously said that the sponge was put upon some Hyssop, he writes thus:—"Nor need we wonder how the sponge could be put up to his mouth, ... for, as we read in the other Evangelists, which this one (St. John) omits, it was done by means of a reed *. The very learned and acute commentator Estuis † inclines to what he considers a very probable opinion, that the Greek word in St. John, ὑσσώπῳ (*Hyssopo*), is an erroneous reading, and should be ὑσσῷ (*Hysso*), which means a spear-handle or a long stick, and which corresponds with the word *reed*, used by the other Evangelists. This would do away with the Hyssop altogether. But we may also very probably conjecture, with another very useful expositor whom I have examined, that a soldier very naturally used his lance, which was ready in his hand, on this occasion, and that this was meant by the word καλαμος, used by St. Matthew and St. Mark. For, though this word is translated a *reed*, it was very commonly used for a lance or spear; and it is very fair to suppose that the soldier would fix the bunch of Hyssop on the point of his lance, and so raise the sponge to the lips of our crucified Redeemer.—*F. C. Husenbeth, Cossey, near Norwich.*

Valerian Root.—Your correspondent, "A.H.," has been singularly unfortunate in the experiments he has made, with the view to ascertain if cats are enamoured of Valerian. This fact, I beg to observe, is undoubted. I verified it myself about three months since, and it stands thus entered in my Note-Book.—"May 21st. Purchased at Covent-garden market a root of Valerian, quite fresh. Conveyed it home mysteriously in an omnibus, much to the horror of the passengers, who eyed the bag in which it was contained as if it would breed a pestilence. Several parties quitted the omnibus abruptly, sniffing, and casting a look behind them not readily to be forgotten. I sat by, unmoved as a stoic, of course disclaiming all connection with the bag. Arrived at my journey's end, I hastily dismounted, dragging my charge after me, and was soon lost to sight. At night I tied the Valerian up in two sheets of thick brown paper, suspending it about 18 inches from the ground, and fastening it round the root of a tree. In the morning I found the paper very much torn and scratched. It exhibited, too, distinct traces of the various cats' teeth that had been engaged on its destruction during the night. Early next morning I contrived, unnoticed, to watch the passing scene. There sat seven sleek grimalkins, evidently in high enjoyment; while an eighth (no doubt a tom-cat), was rolling himself over and over on the Valerian, which was now strewn all over the ground. In a few minutes the whole were in a wonderful state of excitement, their festival terminating with a chorus, the harmony of which caused me to issue instantaneously from my concealment, and liberally reward the performers with the handle of a long rake. By this exploit I effected the 'lay of the last Minstrel!'"—*William Kidd, New Road, Hammersmith.*

Growth of Trees.—In the *Chronicle*, p. 541, there is a short article headed "Growth of Forest-trees." To me it is not satisfactory. We all know that if a tree is fastened to a wall, we never see the shreds moved upwards by the elongation of the stem; or when the stem gets to the coping of the wall, I never knew of the coping being moved by the pressure. We see plenty of strong shoots issuing from the old wood, but I do not believe that the old wood ever elongates.—*A. S.*—"A Subscriber, Ireland," states on this subject, that the result of his experience causes him to doubt the generally removed opinion that wood lengthens after being formed. In opposition to this, I will mention a fact that has come under my own observation. In the month of July

* S. Augustinus in Evang. Joann. Tract cxix. de Cap. 19.
† Estuis in loca difficiliora S. Scripturæ, in Joan. 19.

1839, whilst looking at a fast-growing plant of Abies Deodara, in my plantation, a friend who was with me remarked, that the top shoot of the year was going up with two leaders, and immediately removed one with his fingers, just within his reach. The annual growth of the tree in question, in height, is well defined; and now in 1844, the bottom of the leading shoot of 1839 appears out of the reach of any man of the common stature. It may be said that in so trivial a circumstance as pinching a shoot off a tree, I may probably be mistaken in my date, but the fact is, I made a memorandum at the time of my friend's visit; and he was never here before, nor has he been since.—*A Subscriber.*

Mulberry-trees.—A correspondent, p. 523, speaks of having a fine Mulberry-tree about 200 years old, of which he appears (and most justly) proud: he adds that the alterations he is obliged to make will compel him to bury the root five or six feet below the surface of the ground. These alterations will inevitably be fatal to the tree, for the root of the Mulberry cannot bear that pressure. He has, therefore, no alternative but to remove it, and he must then remember that he is dealing with one of the most difficult plants he possesses, at a very advanced age, and in the removal he must have the hand and eye of the master assisting. If autumn is the time for the removal, he should first select an eligible situation to which to remove it, and, taking the tree at the size he describes, make a pit in a circular form, six yards in diameter and two feet deep; and if the bottom of the pit is not congenial, as for instance gravel, tile it, then put in about three or four inches of the best fine-riddled loamy soil that can be got—nothing is better than old rotten turf; the bed being now ready for the plant, take care to have an ample quantity of good materials at hand for filling up the pit. These things being finished prepare to take up the tree, by removing the soil to the extent of six yards all round the trunk, until you lay the main roots bare; erect three poles round the tree to be raised with a pulley, which must be fastened carefully to the tree under the main branches; give the pulley a steady pull, and ascertain whether you can raise the tree, but by no means force it or tear the roots. If you cannot stir it, secure the pulley where it is, and ease the roots of the soil with increased care, then try the pulley again: repeat this every two hours, adding additional caution as you get the finer roots, and always take care to bind your pulley, as this will always show you the resisting root, and call your attention to the point where your careful exertions are wanted; in this way you will raise the tree, but do not let it fall from the pulley poles. When it is up take it to the place where you intend to plant it with as much care as that with which you took it up, and lower it in the way you raised it, taking care to place all the roots in their natural position and at ease; then cover the roots three or four inches thick with the same sort of soil as you have under it as lightly as you can, keeping the tree perfectly steady. Now water moderately with guano water, and lay on about four inches of loose warm stable manure, and in like manner proceed until you get to the surface, always before watering raising and settling the tree a little so as to let the soil to the roots. In the upper layers use any compound that is at hand, which is light and nourishing, with either slaughter-house, pig, or artificial manure, and then bank it up and turf securely, steadying the tree with three or four props for the winter, and covering the whole up with two or three feet of warm stable manure, which should be exchanged from time to time during the winter. Give the roots at intervals a moderate watering by removing four turfs and putting in about four bucketfuls of sockage-water, chamber-water, or guano-water. In this way I removed two large Nut-Almond trees about three years ago, larger than what "A Correspondent" describes, and they did well; the year before they had fine full-grown shelled nuts. Some years ago the Duke of Devonshire also removed a much larger tree than the one described at p. 523, from Derby to Chatsworth, a distance of upwards of 25 miles, with success. About 18 years ago I removed a fine Yew, of more than 20 years' growth, from a distance, with complete success, and it is now a very fine tree; it required my personal attention for two years.—*J. W. Buchanan, Nuneaton.*—— Another correspondent writes as follows:—If a very large limb of the Mulberry-tree is well stocked and planted, it will take root and grow very well. I imagine that "A Correspondent" may hazard the burial of his old friend, and proceed with his improvements. Having had much to do in planting and laying out grounds, it has happened frequently that I have buried many trees 3 or 4 feet in the soil. Old trees in many instances died—young ones in most cases flourished the more. Young trees, but more particularly Poplar, Elm, and Beech, will throw out rootlets 3 or 4 feet above what before sustained and supported life. I have never found that Oaks liked the operation of covering in and embedding them to any extent, except in a small way, viz., in making roads on the slopes of planted hills: the soil thrown on the lower side amongst them always gave them fresh vigour, as it does all trees, even the Fir tribe.—*K.*

Van Mons's Pears.—Your remarks on the best mode of improving the fruit of Elæagnus parvifolia brought to my recollection the principles on which Professor Van Mons, of Brussels, the producer of so many of the fine new Belgian Pears, proceeded in obtaining them, which, as I had the details from his own mouth, may be worth stating, especially as I do not recollect to have seen a distinct explanation of his views in any English horticultural work. He paid no attention to impregnation with the pollen of superior sorts, as practised by Mr. Knight, nor, as far as I remember (though on this head will not speak positively), did he care whether the pippins which he first sowed were of Pears of first-rate quality or not. His great object was to raise a large stock of young seedlings. From these (of which he showed me probably a quarter of an acre, growing in the rich alluvial soil of his nursery, in the lower part of Brussels), he selected those plants which, from their vigour of growth and largeness, and (I think) thickness of leaves, he judged likely to answer his purpose, and transplanted them (I incline to believe more than once, to hasten their blooming), waiting patiently the six, eight, or ten years that elapsed before they bore fruit. He did not care of what quality this fruit proved. He sowed all the seeds of all the kinds, and again selected the best plants. These again were transplanted, and usually bore fruit after a less number of years' growth than the first generation, and several of the Pears always proved of good quality. But a third sowing and similar selection and treatment were necessary to obtain his finest kinds, and almost the whole of the produce of this third generation was excellent; and it was in this way he raised his Marie Louise, and other fine sorts. Thus, as far as my recollection serves, his great principle was to select from successive generations, out of a large stock of seedlings, those which from long observation he knew would be most likely to produce good sorts, and it was not till the third generation that he calculated on producing first-rate fruits. He told me that he had originally been led to follow this plan from his experience in raising Roses from seed, of which he had gained many fine varieties, and he pursued a similar method in obtaining new Apples. Might it not be worth while to add to the course of treatment which you have so well pointed out for Elæagnus parvifolia, the selection of the most vigorous and promising plants for two or three successive generations from seed? And probably a similar selection might also be important in trying to raise improved varieties of Raspberries, Currants, &c.—*W. S.* [We have before heard something of this plan: but it is to be remembered that Dr. Van Mons obtained very few good Pears out of thousands of seedlings; and that Mr. Knight obtained very few bad ones out of a very small number of seedlings. We prefer our own method.]

Bulb Water Cucumber Glasses.—I some time ago made several experiments with these, in opposition to the dry cylinder. I found that the fruit in the bulb glasses, after ten days' growth, was about one-third longer and twice the weight of those grown in dry cylinders; and finding that with these advantages the quality was not injured, I proceeded last year to make various experiments upon Peaches, Pears, and Grapes. The constant evaporation of water upon the fruit increased the size of the Peach, but injured its flavour; upon the Pear no beneficial effect was apparent; the Grapes were, in some instances, improved in size and quality; those that hung nearest the water were preferable, and some of the berries at a distance from the water prematurely decayed. In the meantime, however, my object in writing is to call attention to a propagating glass (which I have constructed constantly to evaporate water by heat, and condense it by cold alternately), for keeping the cutting or plant in a constant state of moisture, similar to Ward's cases. I have placed a few in the hands of my gardener, who reports favourably of them. The accompanying is

a plan, both of the open and close condensing propagator. The close condenser, No. 1, should be somewhat of the form of a conical dome, or between the cone and the parabola, in order to allow of the drip, on adhering to the interior of the glass, to descend into the channel A, for the reception of the water; the channel being once filled needs no farther attention, as the diffusion of moisture by heat, and its return and alternate condensation, not only feeds with moisture the plant or cutting more regularly than by syringing, but by its condensed particles adhering throughout to the interior surface of the glass, the drip is prevented. No. 2 is an open condenser applicable to Grapes, either in or out of the house; it would require more frequent supplies of water than No. 1, as the greater portion of the water would fly off by evaporation, and would not be condensed again into the glass. Ribbed glasses are perhaps preferable, for preventing drip, to plain glasses.—*Apsley Pellatt, Falcon Glass Works.*

Asparagus, &c.—"If you please, Sir," said my gardener to me a day or two ago, "I want some more salt." "Salt!" I replied, "have you not plenty of liquid manure fixed and prepared with sulphuric acid? What can you possibly want with salt?" "Why, Sir," returned the man, "we want that too; but you know, Sir, you said in the spring, that we never had such fine Asparagus before, and depend upon it, it was all owing to that 'ere salting we gave the bed last year." I quite assented to the fact and the inference, and more salt was ordered. I was turning away, when the man again arrested my attention: "We must not make the new Asparagus bed yet, Sir?" "And why not?" I replied; "the weather is fine, and you have plenty of dung?" "Why, you see, Sir, them young plants a'n't done growing yet; and as we had such a capital crop of Strawberries because we didn't cut off the leaves, I should think what's good for the Strawberries is good for the Grass; and John Squinell killed all his Asparagus by cutting off the tops in June." Here are two practical proofs of the value of the advice contained in the *Gardeners' Chronicle*, viz. the salting of Asparagus, and not cutting off the leaves of the Strawberries. I give the colloquy as it occurred, because the testimony is all the stronger for being unsought. Your correspondents who have failed in the use of salt, have doubtless applied too much. The quantity I used to my bed was a pound to every square yard, applied after cutting off the tops, and early in the spring in rainy weather. With regard to the Strawberries, I think my gardener's argument unanswerable—"What's good for the one is good for the other." I certainly never had such fine plants in the spring, or better crops in the summer, than I have obtained since I left the leaves alone. Can you explain the reason why Myatt's Eliza has completely failed this year, both in my own and neighbour's garden? The stock was good and true, and bore well last year; but this, I have not had a dozen fruit on three beds.—*C. R. Bree, Stowmarket.* [Dry weather?]

Destroying Wasps.—Your correspondent's plan of putting the spirits of turpentine into a bottle instead of into a cup, is a decided improvement. If he has an opportunity of doing so, would he try a plan I have suggested more than once, but do not know whether it has yet been tried? Let a small quantity be squirted into the hole as far as possible, and then let the hole be blocked up with clay. It is possible the soil may imbibe so much of the turpentine as to prevent success, but the experiment is worth trying.—*J. S. Henslow, Hitcham.*

To destroy Ants.—"It happened that a piece of camphor was laid in a drawer containing sugar, and which was sadly infested by ants. On opening it a few days afterwards, the bottom of the drawer was literally strewed with dead ants. The experiment was repeated with success—a small piece of camphor placed in a corner of the drawer being quite sufficient. Camphor dissolved in alchohol and diluted with water might destroy them if sprinkled on trees or walls, or if poured into their nests."—*John J. Godfrey, Albany, New York, March* 3, 1832. "Proteus" forgets where he met with the foregoing extract, neither has he tried it; but, concluding from late Numbers of the *Chronicle* that the destruction of ants is an object of interest to some of his fellow-subscribers, he contributes his mite to their service.

Sting of a Bee.—I beg to inform a correspondent in a former Number, who applies for a remedy for the sting of a bee or wasp, that the application of a washerwoman's blue-bag, moistened, is the best remedy, and acts almost like a charm instantaneously; it is far preferable to liquor potassæ, or any alkaline solution.—*Medicus Corcagiensis.*

Gooseberry Caterpillar.—Being for many years annoyed by this destructive pest, I have endeavoured to get at the root of the evil by studying the habits of the insect. In a flower-pot filled with earth, and covered by a finger-glass to prevent the caterpillar wandering, I placed on a leafy slip of the Gooseberry tree six caterpillars, supplying them every second day with a fresh sprig, and thus watched their progressive changes until they dropt from the branch, and buried themselves. In this manner I discovered that there are two seasons in the year for the ravages of this pest. The first caterpillars appearing about the middle of May, and eating for five weeks, in this time the usual mischief is done, and the fruit is destroyed, unless the trees are carefully picked; but I imagine that few persons are aware that the evil is only half met by this one picking. The Sawfly (Nematus Ribesii), according to Stephen, again emerges from the pupa state in the beginning of August, or a few days earlier, according to the season; and after having again defoliated the trees, deposits itself in the earth until the May of the following year. The early decay of the Gooseberry leaf—the indifference about the tree when the fruit is gone by—may be the cause why this second swarm is not taken notice of; but certain it is that on the second picking depends the extent of the plague for the next year. If then carefully picked there will be no larvæ in the ground for the next season. If neglected, the increasing plague of insect life goes on. Two successive years of autumnal picking, I can say from my own experience, will banish the Gooseberry caterpillar, though one careful looking over the trees on the third year in autumn may not be misplaced. Perhaps gardeners are not aware that seedling Arbutus are a favourite food of the same caterpillar.—*A Lady Gardener, County Cork.*

Sporting Character of the Peach.—A rather curious instance of this has occurred here. A Peach tree—the Vanguard—has produced a very fine red Roman Nectarine. The Peach tree has a fine crop of Peaches, and the Nectarine looks singularly curious among the Peaches. In what way can you account for it? I never saw anything of the kind before.—Did you?—*M. Busby.* [Yes—often. These occurrences are called sports, and it was doubtless thus that a Nectarine was first obtained.]

The Gray Parrot.—In reply to "A Constant Reader," I would mention that a good way for preventing a favourite bird from picking off its feathers, is to brush or rub the parts that it is fondest of picking with a strong solution of bitter aloes soaked in water. If this is done for a short time I imagine the bird will soon desist from playing these tricks.—*M. H. W.*——Another correspondent remarks that the bad condition of "A Constant Reader's" bird is occasioned by "want" of "attention to diet." "Bread and milk, chicken bones," &c. are not to be met with every day in the African woods.

Discard this system, and begin by giving a drop or so of castor oil dabbed on a small piece of bread, previously saturated with honey or with sugar and water. Remove with a sharp file the apex of the lower mandible, so that a small triangle may be formed; this will stop the drawing of feathers, but will not interfere with the necessary process of pruning. Feed on Hemp-seed, with, occasionally, pieces of ripe fruit, and now and then two or three Almonds in the shell. The time necessarily occupied in satisfying its appetite with the seed will not only prevent surfeit, but will stop the screaming through idleness—although the gray parrot is not the most noisy of the race.—*E.*——"A Lady" writes—"I purchased a gray parrot that had scarcely a feather, and it continued to pluck them until it was taken off all greasy food, also meat, and even bones, as the marrow gives them a taste for blood, and they will even pluck their feathers for the sake of the blood at the roots: they will lose this habit after a time, should this plan be strictly adopted:—Capsicum twice a week should be given till they assume a healthy appearance. Seeds are what they like. My bird in a few months had a fine plumage."——Another writer recommends change of food, viz., bread scalded in water, Indian corn, and occasionally a few Almonds. The heat of the skin is the cause of Poll's troubles. It should also have tepid water to wash in, and should always be kept out of draughts; the latter are most injurious, and generally fatal to the tribe, or any birds accustomed to a warm climate.—*Falcon.*——A fifth correspondent, signing himself "Medicus Corcagiensis," says that "A Constant Reader's" treatment of his parrot is the cause of his depriving himself of his feathers. The same writer states that animal food in any shape or form, if given frequently and long continued, will produce this effect.——Do not allow the gray parrot to pick any more chicken-bones, or any kind of meat; confine her strictly to bread and milk, and a little hempseed, if she will eat it. Ripe sweet fruit may be offered occasionally; give her now and then a shallow pan of water, tepid, to dabble about in like a duck. I should like to hear the result of this regimen in the course of two or three months.—*Psittace.*——Milk and chickens' bones are bad for a gray parrot, but particularly the latter. Parrots are fruit-eating birds, but, like their fellow bipeds, are fond of food that is not good for them. Animal food induces a feverishness in the skin, which causes them to pick their feathers; these easily come out, and they get a little soft picking on the ends of the quills, and thus it goes on till, unlike the Kilkenny cats, not even a vestige of their tails remain. They delight in a mealy Potato, or bread soaked in water, which agreed right well with one in my possession for some time.—*B. F.*——"N. S. H." asks, "If any remedy can be applied to prevent a favourite bird picking off its feathers?" To this I answer, No. This is one of the inveterate bad habits peculiar to some birds, from which they never can be weaned. Your correspondent will, I fear, have an unsightly bird to look upon, as long as his parrot survives, if, indeed, it is considered a matter of "necessity" to reckon him as one of the family, and so preserve his life. I have had several birds during the last six years, inoculated with this annoying propensity, and in every case I have found it expedient to shorten their lives. Their *personel* has rendered this a simple act of humanity.—*William Kidd, New-road, Hammersmith.*

Plan of keeping up a Moist Atmosphere.—"A." has found the following mode of maintaining a moist atmosphere, during the propagation of cuttings, successful:—

Reference to Plan.

a The cover of a handglass.
b The framework of ditto.
c A tray, or riddle, having a bottom made of copper wire, or perforated zinc, to receive soil wherein to plant cuttings.
d An earthen pan, filled with water.
e Cuttings.

Place the pan upon the ground, and the tray upon the pan, and over these put a handglass.

Foreign Correspondence.

Hong-Kong, March 21, 1844.—You have, doubtless, often heard of the celebrated Fatee Gardens, near Canton, the flowery land, as the name implies, from whence a great number of those fine plants were first procured which now decorate our gardens in England. They are situated two or three miles above the city, on the opposite side of the river, and are, in fact, Chinese Nursery Gardens, where plants are cultivated for sale. I visited them for the first time last summer, on my arrival in China, before proceeding to the northern provinces; and again a week or two ago. There, I suppose, I beheld a specimen of the-far-famed system of Chinese gardening, about which we have heard so much in England, and of which I shall tell you something fully. The plants are principally kept in large pots arranged in rows along the sides of narrow paved walks, with the houses of the gardeners at the entrance through which the visitors pass to the gardens. There are about a dozen of these gardens, more or less extensive, according to the business or wealth of the proprietor; but they are generally smaller than the smallest of our London nurseries. They have also stock-grounds, where the different plants are planted out in the ground, and where the first process of dwarfing their celebrated trees is put in operation. These gardens contain large collections of Camellias, Azaleas, Oranges, Roses, and various other well-known plants, which are purchased by the Chinese when in flower. The most striking plant in autumn or winter is the curious fingered Citron, which the Chinese gather and place in their dwellings or on their altars, when it is much admired both for its strange form and also for its perfume. The Mandarin Orange is also much grown at Fatee, where the plants are kept in a dry state, and flower and fruit most profusely, producing large, flat, dark, red-skinned fruit. The Chinese have a great variety of plants belonging to the Orange tribe; and one which they call the Cum quat—a small oval-fruited variety—is most excellent in their preserves. The Murraya exotica, Aglaia odorata, Ixoras, and Lagerstroemia, are also very ornamental here in autumn. In spring the Fatee Gardens possess the greatest attractions. Now they are gay with Azaleas, Cydonias, double-blossomed Prunus, Judas-tree, Rubus rosæfolius, Bletia hyacinthina, Roses, and Camellias. The Azaleas are most splendid, and reminded me of the Exhibition in the garden of the Horticultural Society of London, only on a much larger scale. The principal kinds grown are Indica, Indica alba and phœnicea, lateritia, variegata, and the yellow Azalea sinensis. By the by, I found this plant wild on the Ningpo Hills, so that there is no doubt of its being a genuine Chinese variety—a fact which you seem to doubt in the "Botanical Register," where this plant is figured and described. The air at this season around Fatee is perfumed with the sweet flowers of Olea fragrans, and the Magnolia fuscata, both of which are grown extensively in these gardens. Dwarf trees, as you may easily imagine, occupy a principal station, and are highly prized by the Chinese; they are trained into the most grotesque and curious forms, resembling pagodas, dwelling-houses, and various kinds of animals; but during my stay in the town of Ningpo, in the north, I saw some which far surpassed any about Canton. These were Pine-trees, clipped and trained in the form of deer—horns, legs, eyes, and everything complete. A Mandarin there very kindly offered to make me a present of one of them, but I was obliged to decline his civil offer, as it was of no use to me, and as my collection of plants was already large, and difficult to move about with. The plants which stand next to dwarf trees in importance with the Chinese are certainly Chrysanthemums, which they manage extremely well—perhaps better than they do any other plant. So high do these plants stand in the favour of the Chinese gardener, that he will cultivate them extensively, even against the wishes of his employer; and, in many instances, rather leave his situation than give up the growth of his favourite flower. I was told the other day that the late Mr. Beale used to say that he grew Chrysanthemums in his garden for no other purpose than to please his gardener, not having any taste for this particular flower himself. Moutans are not natives of the South of China, but are brought down in large quantities every year, about the month of January, from the northern provinces. They flower soon after they arrive, and are rapidly bought up by the Chinese to ornament their houses, after which they are thrown away, as they do not thrive well so far south as Canton or Macao, and will not flower a second season. They are sold according to the number of flower-buds they may have upon them, many of them fetching rather high prices. One of the old gardeners here, whose name is Aching, does a considerable trade in seeds with the English and American residents; but, unfortunately, he has got a bad name, owing to his seeds generally failing to grow when they are sent home. It is now currently reported that the old man boils them, in order that his trade may not be spoiled by some enterprising propagator at home; but I do not credit any statement of this kind, and you will, therefore, confer a great favour on him if you will contradict this report, and save his good name. Although the botanist will find but little that is new to him in these gardens, yet they are well worth a visit; and in the spring months, when most of the plants are in bloom, they have really a gorgeous and imposing appearance, worthy of the poetical name of Fatee, or flowery land, which the Chinese have given them. The garden which formerly belonged to the East India Company is still in existence; it is but a small place on the river side, not more than 60 paces each way, having broad chunamed walks round it, and a clump, with a few trees in the middle, and a few more between the walk and the wall all round. Since Mr. Reeves's time no one seems to pay any attention to the plants here, and if there ever were any rare species, they are all gone now. A few Palms, Plantains, Magnolia grandiflora, Clerodendron fragrans, Justicia adhatoda, Ligustrum, Murraya exotica, the Lechee, and two or three other well-known things, are all that it contains. The factory itself is still in ruins, but the Consul is getting them cleared away, preparatory to the construction of new houses for the English merchants. In front of the American factory there is a very nice public garden, at least six times the size of the Company's, with fine broad walks for recreation, and containing numerous shrubs and trees indigenous to the country; nothing, it is true, of any rarity, but sufficient to make the garden look extremely well. A good garden and promenade is of much importance here; for it is likely to be some years before foreigners enjoy the same liberty at Canton as they do in the other parts of China.—*R. F.*

Societies.

BOTANICAL SOCIETY OF LONDON.

Aug. 2.—J. Reynolds, Esq., Treasurer, in the Chair. Mr. G. S. Gibson, and Mr. J. Tatham, Jun., presented specimens of a new British plant, Spergula stricta of Swartz (*Arenaria uliginosa*, Schleich. and Decand.; *Alsinantha stricta*, Fenzl and Reichenbach), discovered by them in June last (in company with Mr. J. Backhouse and Son, and Mr. S. Thompson), near the top of Widdy Bank Fell, about ten miles west of Middleton, in Teesdale, and five from the High Force, in Durham; the elevation was about 1800 feet. The locality was confined to a very small space.—Specimens of Anemone ranunculoides, were presented by Mr. M. Stovin, found wild in a wood near Worksop, Nottingham. Specimens from this locality were presented in June last: and in a letter to the Secretary, Mr. S. observes, "The more I see and hear of this plant, in the Nottingham station, the more am I convinced of its being wild."—The concluding portion of Mr. Lees's elaborate paper, on the British Fruticose species of Rubus was read, and several specimens and drawings exhibited in illustration of the views contained in the Essays.

Reviews.

The Favourites of the Flower Garden, arranged according to the Natural System of Botany. By G. Francis, F.L.S. 12mo. Simpkin & Co.

This little book is intended for the use of very young people, who desire to acquire some knowledge of Botany as an amusement, and it is well suited to that purpose. Compared with the juvenile introductions to the Linnean System of Botany, it is a considerable stride; and it shows most clearly how ignorant was that outcry which arose a few years ago, when it was first proposed to substitute amongst students, for the threadbare artificial arrangement of Linnæus, the more philosophical classification of Ray and Jussieu. People now inquire what the difficulties are which terrified the ancient Botanists of 1830, and wonder what their clamour was about. The fact is, that the one method of studying Botany is as easy as the other, if set about in the right way. The object of Mr. Francis is to point out that way, and he has done so zealously. We doubt, however, whether, for the purpose of teaching, the work is quite exact enough. However, it is only to be regarded as a preparation for further information; as the means, in fact, of exciting, rather than satisfying, a taste for the study of the common flowers of our gardens. By aid of an abundance of etchings and woodcuts, the subject is rendered so easy to understand, that the most dull of apprehension may quickly learn how to use the natural system for common plants. The Author's account of the Daisy will illustrate his mode of dealing with the popular part of his subject.

"Everybody knows the Daisy of the fields, and every one with the least taste for poetry must have read some little poem written in its praise; but our young friends may not be aware that the numerous varieties of Daisies found in the garden are all derived from this little wilding. These garden favourites are of much difference of form and colour; one variety is of a very dark-red, another of pink and white, others pure white, while a fourth kind has one large flower [head] and several smaller ones growing out of it; so that it has been compared to a hen surrounded by her chickens, and called accordingly the *Hen and Chickens Daisy.* These denizens of the garden have not, however, the charms of the wilder plant—they blossom but at one season, they are often killed by the drought of summer, and the damp of winter; but the little darling of the wild, and which has been emphatically called 'Nature's Favourite,' the 'Poet's Darling,' the 'Eye of the Day' ('Day's Eye' or 'Daisy'), and many other names, blossoms everywhere and at all seasons, suggesting a thought of innocence and home, for it is especially an English flower; and delighted must Dr. Carey have been to see one spring up in India, from among some other seeds brought from England. This circumstance has given rise to some exquisite lines by the poet Montgomery, which are too long to quote, but which conclude thus—

Thrice welcome little English flower,
To me the pledge of hope unseen,
When sorrow would my soul o'erpower
For joys that were, or might have been.
I'll call to mind how fresh and green
I saw thee waking from the dust,
Then turn to Heaven, with brow serene,
And place in God my trust!

"It was a delightful thought of the ancient Celts to suppose that the employment of new-born infants, removed to heaven, became henceforth the scatterers of flowers upon the earth. The virgins of Morven, to soothe the grief of Malvina, who has lost her infant son, sing to her:—'We have seen, O Malvina, we have seen the infant you regret reclining on a light mist. It approached us, and has shed on our fields a harvest of new flowers. Look, O Malvina—among these flowers we distinguish one with a golden disk, surrounded by silver leaves—a sweet tinge of crimson adorns its delicate rays; waved by a gentle wind we might call it a little infant playing in a green meadow, and the flower of thy bosom has given a new flower to the hills of Cromla.' Since that day the daughters of Morven have consecrated the Daisy to infancy; it is, said they, 'the flower of innocence—the flower of the new-born.'

* * * That old favourite the Daisy, born
By millions in the balmy vernal morn,
The child's own flower.—*Carrington.*"

Garden Memoranda.

Groom's Nursery, Clapham Rise.—At this nursery there is now in bloom many large and well-grown specimens of all the varieties of Lilium lancifolium. Several of the plants are between 6 and 7 feet high, and, having from 8 to 10 stems, each producing from 12 to 20 fully expanded blooms, they present a most magnificent appearance. On one specimen of L. l. rubrum or speciosum, there are as many as 30 flowers and buds on a single stem. Not only are these Lilies extremely

handsome on account of their large showy blossoms of the richest colours, but they also possess an agreeable aromatic fragrance which adds considerably to their value. For decorating the greenhouse and conservatory at this season, when flowers are scarce, they are invaluable, as they keep in bloom for a considerable length of time, and in beauty they have no rival. It may be remarked that in some collections we have seen, scarcely two plants have the same shade and disposition of colour. There is a regular gradation of tints, from pure white to the rich colour of L. sp. rubrum. In some, the rich crimson spottings are more numerous; in others, they are larger; and in a few they are almost wanting. Mr. Groom, who is a most successful cultivator of these plants, has grown nearly all the kinds in the open air for three years, and he considers them sufficiently hardy to stand our winters, if planted in light soil, and at a good depth. This season he has large beds of them planted out, which are producing an abundance of bloom. Mr. Groom remarked that the plan he generally pursues in the pot culture of these Lilies is, to grow them in pots of a large size, having plenty of drainage, and to use peat only with a little fine sand for the soil. One great point is to keep the bulbs, particularly the largest, at a sufficient depth to allow soil enough above the bulb for the stem-fibres to grow freely. When they require repotting, which should only be performed whilst the bulbs are dormant, they should be turned out of the old pots, and have the crocks carefully removed, so as to avoid injuring the fibres, or even disturbing the soil. The bulbs are then to be repotted in a larger-sized pot in peat and sand, with good drainage. They are easily increased by placing some pieces of turfy peat round the stem at a sufficient distance to allow room for some finer peat to be placed next the plant. In this way a fine stock of them may soon be obtained.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

BERBERIS UMBELLATA. Umbellate Berberry. (*Hardy Shrub.* Berberaceæ. Hexandria Monogynia.—This is a hardy subevergreen bush, about three feet high, growing freely in the common garden soil, flowering freely in June, and easily increased either by seeds or layers. It was raised in the garden of the Horticultural Society, from seeds received from the East India Company, at different times, and under various names, but more particularly those of B. Wallichiana and floribunda. It is no doubt in many other collections under this or similar names. B. floribunda, however, has spiny leaves, not at all glaucous on the under side, and B. Wallichiana, which also differs in these respects, has sessile fascicles of flowers, and is quite another thing. This is easily known by its narrow, spineless leaves, slightly glaucous beneath when fresh, and becoming more so when dry. Dr. Wallich has distinguished a plant called B. angulosa from his B. umbellata, but our specimens of it from him present no tangible mark of distinction. As for the name umbellata, it is unfortunate that it has been introduced into systematic works, for the shortness of the racemes, from which circumstance it has been taken, is apparently accidental and unimportant.—*Botanical Register.*

GLOXINIA SPECIOSA. Garden varieties. (*Stove Herbaceous plant.*) Gesneraceæ. Didynamia Angiospermia.—1. Gloxinia magnifica. 2. G. insignis. 3. G. bicolor. 4. G. Cartoni.—For the few last months our gardens have been furnished with some new varieties of this beautiful plant, which have excited universal admiration; especially those in which pink is the predominant colour. We have, therefore, thought it desirable to take advantage of an opportunity afforded by Mr. Glendinning, of the Chiswick Nursery, for bringing together the most distinct among them. The account Mr. Glendinning has given of their origin is as follows:—"These beautiful varieties were raised from G. speciosa rubra fertilised with the pollen of Sinningia guttata. The flowers, however, give little evidence of the male parent, although the branching habit which distinguishes Nos. 1, 2, and 4, are proofs of their alliance to Sinningia, particularly that of magnifiora, which has very hairy leaves and stems, and an erect growth. They were first raised in the gardens of the Duke of Northumberland at Syon, by his grace's gr., Mr. Carton, who has been long celebrated for producing various interesting novelties by hybridising. Plants of them were exhibited by me before the Horticultural Society in Regent-street, in June last, when they were awarded a Banksian Medal. The same individuals have continued to bloom ever since very profusely, and are now, August 14th, still in flower. On that account, as well as their great beauty, they are likely to prove permanent objects of interest in our gardens."—*Botanical Register.*

Miscellaneous.

Brazilian Beet, a Plant for either Kitchen or Pleasure-Gardens.—It is about 10 or 12 years since the Brazilian Beet (Beta braziliensis) was introduced into the gardens of Belgium; but there it was only considered as an ornamental plant, and the beauty of its leaves makes it certainly quite worthy of being so, for the golden-red and crimson-coloured ribs produce a beautiful effect among other plants. It does not, however, appear that, at present, anybody has ever thought of cultivating the Brazilian Beet as a vegetable; on the contrary, we have remarked that in most of the gardens where it was formerly cultivated it is now disappearing, to make room for other ornamental plants. Perhaps also, this plant is not a favourite with amateurs, as its flowers are rather insignificant. Before we speak of its cultivation, it would be better to give its description:—The root is fleshy, and divides itself in the soil; the leaves are from 16 inches to 3 feet long, according to the fertility of the soil and its exposition. The middle of the leaf forms a midrib from 2 to 3 inches broad, fleshy and succulent, and becomes thinner towards the top. It is yellow or red, and varies in all the shades of these two colours. The width of the leaf is 8 inches; the upper surface shining, puckered, of a beautiful green, crossed with veins of the same colour as the midrib. The stem developes itself the second year, and resembles in this, and also the flowers and seeds, those of the Garden Beet. It produces an abundance of seeds, and is consequently very easy to propagate. *Cultivation.*—To cultivate this plant, you must sow the seed at the end of March or beginning of April upon a cold bed, or a well exposed border; the seeds come up in about 8 or 10 days, and in three or four weeks the young plants are strong enough to be transplanted. To each plant is given 3 feet square of ground, if it is good and fertile; in a moderate soil 1 foot 8 inches is sufficient. The Brazilian Beet flourishes in almost all kinds of soils, but a maiden soil, composed of sandy loam, suits it best. During its vegetation, particularly at the beginning, it must be well hoed and watered in dry weather. It is not necessary to take away the weeds, because they are smothered by the large leaves of the Beet. *Uses.*—When the season is rather unfavourable the leaves may be cut off every five weeks, beginning in June, taking the outside ones, and leaving those which form the heart, or else cutting off the neck of the root, with all the leaves, which does not hurt the plant. It may be prepared for table like Spinach, in which case the green part must be separated from the leaves; the coloured ribs may take the place of Asparagus, and be prepared in the same manner, after they have been boiled in water; they may be eaten with either oil or vinegar; at all events the skins which cover them must be peeled off the ribs. In order to obtain this plant in winter, or early in the spring, it is necessary to make a seed-bed late in June or July; to prick out the young plants upon a cold bed, where they will remain until February; then they must be transplanted upon a hot-bed, where they will give an abundant crop. They may also be taken out in the autumn, before the winter sets in, and be planted in a cellar, where they will produce leaves during all winter, which may be eaten cooked or as a salad. We can recommend the cultivation of this plant, for its produce is not only sure, but as agreeable as wholesome, and in all respects deserves the preference to the common garden Chard Beet.—*Revue Horticole.*

The White, or Barn Owl.—Another species, the victim of all who, ignorant of his value, can get a shot at him. "As a constant destroyer of rats and mice," says the historian of British Birds, "the services performed by them for the agriculturist have obtained for them a toleration which they well deserve." I fear this remark applies to some very enlightened localities: here he obtains no mercy. The number of mice this bird must destroy is very great, as a vigilant observer has seen him return to his nest with his prey every five minutes. The gardener complains of the destruction of his early crop of Peas by mice, but he feels no hesitation or remorse at having a shot at the bird who would be of essential service to him in preserving his produce from these depredators.—*J. M.*

CALENDAR OF OPERATIONS
For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

THE beginning of September, when slight fires will be necessary in dull or cold weather, is a critical time for stove plants. The house must now be kept more close, air being given in the middle of the day only. An increase of heat by artificial means is more likely to retard the ripening of plants now than if they were left cool and dry: the thermometer should not, however, be allowed to fall below 60°: for the next six weeks, and during this time, it is of as much importance to keep the atmosphere of the house dry as in the dead of winter. These rules, however, do not apply to plants whose habit is to grow in winter, as is the case with many bulbs- Orchidaceæ and a few other plants. Clerodendron splendens is one which grows late in the autumn, and may now be encouraged; it will flower for a long time in winter, and established plants of it should not be forced to grow in the spring or early summer: like some other plants it requires a long time of rest after flowering.

Conservatory.—The management of the conservatory will be more uniform now than in summer: no syringing will be necessary unless for a plant here and there, which may require it for keeping down insects; where blinds have been in use to keep off the sun they cannot be dispensed with yet altogether, but use them as little as possible from this time: get all the watering done in the morning, and give no more of it to any stove plants which are brought into this house for their flowers than just enough to keep them from drooping their leaves. The few species of Lantana which we cultivate in this country are well suited for flowering in this house late in summer and through the autumn, and there is no doubt but some kinds of them would interbreed and make fine hybrids. There are between 40 and 50 sorts of Lantanas in the Berlin Botanic Garden, many of which, no doubt, would be welcomed in this country, and might easily be procured through the nurserymen. The old Turnera elegans is a very useful and gay plant: it flowers from April to October in the conservatory, and even out of doors in summer; but it requires a house rather warmer than a greenhouse in winter, and is the first to go off in damp winters. Young plants of it in small pots, well drained, and filled with sandy loam only, might now be put in a spare melon frame to ripen them off; when they have filled the pots with roots, harden them by admitting plenty of air. In winter place them on a shelf near the glass, in a cool part of the stove.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.
Out-door Department.

Now that the weather is so fine it will be as well, where such convenience is requisite for the preservation of the more hardy of the tender plants through the winter, that provision be made for the formation of a good-sized temporary pit. Turves of dry peat, where they can be readily procured, are as good a material as can be used, but in the absence of them, turves of a loamy nature will be found a good substitute. The situation where the pits are built should be dry and sheltered, and the turf walls should not be less than fifteen inches thick. Make the walls firm as you proceed, and when of the requisite height dress the sides off square and neat with an old bay knife, or some such instrument. The top layer of turves must be secured in their places by driving pegs through into the lower ones, and if the whole of the walls of a pit of this kind could be covered with Creggon's Patent Asphalte Roofing, which is a very inexpensive material, they would be rendered doubly secure, as so long as they are dry there is no fear of frost penetrating; but if they become wet, which the asphalte would prevent, their protective influence would be materially deteriorated. I intend, as an experiment, to build a pit with mud walls, in imitation of the mud cabins in Ireland, and some parts of this country. These houses are very warm, and if they were built with hollow walls they would be still warmer. My mode of procedure will be as follows:—Having procured a quantity of strong clay, which will be worked to the consistency of mortar, and also liberally intermixed with chopped Straw or refuse Hay to bind together, I shall place down planks fifteen inches apart in the direction of the walls, and then fill in between them with the clay, making it as firm as possible. As soon as the first layer is dry—for it should not be more than six or eight inches deep—I shall proceed with another one, and so on until the walls are of the requisite height. When the walls are dry they may be plastered over with clay and cowdung, just to give them a uniform appearance. These pits I expect will stand for years, and answer admirably.

Reserve Garden.—Prepare a piece of ground for sowing a general collection of hardy annuals, which in late situations may be sown immediately, but in favourable soils the middle of September will be soon enough. Wallflowers, where they are too thick, must be pricked out into nursery beds for transplanting when the borders are cleared for the winter.

General Tom Thumb Pelargonium.—In answer to numerous inquiries, I may state that plants of this kind are not at my disposal, but in the spring will be plentifully supplied by the nurserymen.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Polyanthus.—Now will be a good time to get in fresh varieties, so that they may get well established before winter. If plants come from a distance, and are planted on the border, a hand glass should be placed over them, and carefully shaded. Loam and leaf-soil, in equal parts, will be found a simple and good compost to grow them in. In the "Florist Reformer" of last week, I see a fine Polyanthus raised by the late John Hufton is omitted; it was let out only partially in his own neighbourhood, and I believe it has not yet been honoured with an *alias*. The sort we allude to is Squire Ray. *Carnations.*—Attend to the directions given last week; and carefully extract all decayed petals from the calyx where there is any chance of seed. Prepare soil to pot layers in, when they are ready to take off. It should be loam, river-sand, and decayed leaves, well turned and thoroughly examined, and run through the hand, so that no wire-worm or grub may escape. The flower-stalks, where there is no seed, may now be cut off close to the surface, and the sticks or supports removed, cleaned, and put away till next season. *Pansies.*—Planting beds for blooming next season ought not to be delayed much longer; we have found the following compost to be excellent, in securing strong healthy plants and fine blooms:—Two parts fresh maiden loam, one part decayed cow-manure, one part street-sweepings, one part leaf soil or decayed vegetable matter. This, if well mixed and sweetened by repeated turnings, previous to forming the bed, will we are confident not disappoint the Amateur's expectations. Turn over the soil of the Tulip bed, and if fresh compost is required, see to it in time.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pinery.—Where the autumn arrangement of the plants has not taken place, it is time it was set about, as the less they are disturbed after this time the better. The plants in fruit, those for fruiting next spring, and the later successions should, if possible, be arranged in separate pits, as the treatment required by each differs. The plants for fruiting next year, as well as those in fruit, will require to have slight fires made in dull cold weather; let the fires be made in the morning, so as to admit of a little air being given every day. Keep a less humid atmosphere for the spring fruiters from this time, as it is more desirable now to give strength and firmness to the plants, or I may say to thicken the sap of the plants, than to cause them to increase in size. Suckers and crowns that are rooted should have air admitted daily, to prevent their drawing up weakly.

Vineries.—Continue the attention recommended in former Calendars, for the preservation of ripe Grapes from the effects of damp. If wasps are troublesome, it will be found useful to have some thin bunting stretched over the spaces left open for ventilating: woollen netting, such as is used for wall-trees in the spring, is a good material, if the meshes are sufficiently small. All long growths or Vines (whether bearing or not) should now be stopped, as it is too late for Vines to be much benefited by foliage made after this time. Continue to stop all laterals as they are produced; but with late Vines still growing vigorously, care must be taken not to shorten them too much at once.

Peaches.—Let those trees that have shed their foliage have a thorough washing with clean water, to free them from cobwebs and dust, and after this a washing with soap-suds, to check the increase of any of the Coccus tribe which may be upon the young wood, till the trees get their winter dressing.

Figs.—Continue to pay strict attention to the state of the atmosphere where there are still Figs ripening and swelling, making slight fires in dull cold weather to assist in ripening the fruit; but little syringing and watering will from this time be required.

Melons.—Continue to pay attention to the stopping, thinning, &c. If we have fine weather very good fruit may yet be ripened; keep up a brisk heat by means of fire or linings, in order to admit of plenty of air being given.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Raspberries.—As soon as the fruit is gathered, clear away all the old wood, and any extra shoots left at the summer thinning. Tie the young shoots to stakes or rails, and if very long pinch off their points, but do not shorten them too much now, as from the exposure of the pith, a severe winter would be apt to make the canes shorter than you would wish to have them at spring pruning. Fork in a coating of manure, for, like the Vine, the Raspberry delights in rich feeding. If the above course is adopted, you will be rewarded with well-ripened prominent buds for next season. *Vines.*—Attend to the directions previously given; thin out all useless shoots, remove leaves where they are too thick, and where you do not want the buds in their axils for next season; but while exposing the bunches to more light, be careful to leave a sufficiency of leaves to shade them from the direct influence of the sun's rays. *Gooseberries and Currants.*—A number of bushes protected by netting might now be inclosed in mats, or any other dense substance, for preserving them longer. One advantage of covering some now is, that the buds will be well ripened for next season. The best method I have seen for this purpose was that adopted by the late Mr. Phillips, gardener, at Fingarth. A round frame large enough to be set over a bush was surrounded with waterproof gauze, or bunting, and the top furnished with a moveable lid of zinc or tin. Some gardeners very economically preserve Currants until after Christmas, by surrounding the bushes with the straw ropes they had used for protecting their Peaches, &c. in spring. The difference in the appearance of bushes properly pruned in summer, and those that were neglected, is now very striking. Does any correspondent know of a Gooseberry, as well flavoured, and a week or two later than the old Warrington? Keen's Seedling is a fine fruit, but there are plenty of others fit for the table when it is in condition. At present the Warrington stands alone. *Fruit-room.*—Get this in good order for the reception of fruit, and gather not only the finer wall-fruit as it ripens, but also portions of favourite Apples and Pears, so that by sweating part of them by dry sweet hay, you will be enabled to prolong their season.

Routine.—Attend to Mushroom beds in a bearing state, and continue to make fresh ones. Sow Cauliflower for the spring crop, Radishes for autumn and early winter, and a good breadth of Lettuces. The latter, if sown now or a fortnight hence, in an open, airy space, will often stand the weather better than stronger plants growing in more fortunate protected situations. Dig all vacant ground. Continue planting cut winter stuff. Hoe, fork, and dig among advancing crops, and give an appearance of thought and system to everything under your management.—*R. F.*

VII.—COTTAGERS' GARDENS.

About this season little is required to be done beyond the ordinary routine of keeping the garden neat and clean. Con-

tinue to remove all decayed stems and flowers from plants in the flower border, and clear away all vegetables that are no longer useful, so that the ground may be put into proper condition for the reception of other crops. Onions sown about the end of February, or beginning of March, will now be in a fit state for taking up; and advantage should be taken of this fine weather for drawing the bulbs out of the ground, and spreading them over the beds. They should be laid with their roots upwards, and in the course of a few good sunny days they will become sufficiently dry and matured for keeping good during winter. Care must, however, be taken not to bruise the bulbs in pulling them out of the ground, or in handling them at any time afterwards. They should be turned at intervals until they are perfectly dry and fit for removal, when they may be deprived of their roots and the greater portion of their leaves, and placed in some dry airy situation where they can be attended to and turned over occasionally, always picking out those that are in any way damaged to be used first. Many cottagers string their Onions, which is an excellent mode of preserving them. Gather any Apples or Pears that are ripe, and go over Vines regularly, stopping them, and removing all useless growths, and particularly any that are formed above the fruit, which is generally abundant this season, and should be well attended to. Thin out all small berries from the bunches, and keep the branches neatly fastened in.—*J. McH.*

State of the Weather near London for the week ending Aug. 29, 1844, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

Fuchsias.—*Clericus.*—It is, we fear, now too late to hybridise these plants, because the fruit will scarcely ripen unless the plants are brought into a greenhouse. Ricartonia is a better female than male, because of its hardiness, while fulgens is tender, and should only be employed as a male. We should try to cross exoniensis with Chandleri, Venus Victrix, or plants of that class, which we should also endeavour to improve by crossing the white and violet sorts with each other. F. gracilis would be a good male parent for Venus Victrix. There is no printed guide to these things. We trust to communicate useful information on the subject from time to time. In the meanwhile, hybridisers should keep very exact records of what they do, and report the result, be it what it may.——*G. H. N.*—Thompson's F. formosa elegans, Exoniensis, Epps's Kentish Bride, Venus Victrix, Youell's Queen Victoria, and Halley's Sanguinea.*

Gentianella.—*Q.*—Sow the seeds of this as soon as they are ripe (otherwise they soon lose the power of vegetation), in pans filled with rather heavy peat. Sow on the surface, without any covering except a slight sprinkling of silver sand; then place the pans either in a cold frame facing the north and kept close, or on the north side of a wall, where they are completely screened from the sun, and cover them with a handglass.¶

Glazing.—*H. T.*—Probably your greenhouse roof is too flat; in that case no glazing will prevent the rain coming through, unless the laps are puttied; and if that is done you will still be annoyed by drip. Unless this explains your difficulty, it is not likely that the cause can be determined without actual inspection. The mildew on your leaves apparently arises from damp, or insufficient ventilation.

Gloxinia tubiflora.—*R. H.*—We never before heard of the flowers of this plant dying off. If you have bloomed five plants, and all, more or less, have died off, and always the top flowers, you have been unusually unfortunate. Perhaps you keep it too damp.

Grapes.—*M. H. W.*—When Grapes ripen in the open air, they are always well coloured, with a copious bloom. The circumstance, therefore, of your Black Hamburgh Grapes in your house being almost without colour and bloom, although the bunches weigh from 3 to 4 lbs., must be owing to the want of a sufficient circulation of air. In your new Vine-border you may use all the manures you mention, namely, cow-dung, stable do., pigs' do., pigeons' do., leaf-mould, guano, and, though last, the most important, bone-dust; provided you thoroughly mix the whole with the soil by several turnings over.‖

Heating.—*H. W.*—A very small boiler, say a second size, is large enough. Heat it by tanks by all means, because of their dampness. If you can manage to use open tanks in a chamber below the bed you will be able to steam your house at pleasure, by opening ventilators in the sides of the chamber. No self-acting ventilators answer the purpose in hothouses. The dampness of the air soon puts them out of order. Besides, if you want much ventilation, such contrivances will not give it; if you want very little you may dispense with it wholly. It is a good plan to bring cold air into the house through a pierced pipe; but you had better carry it into the house in such a way as to get the air warmed before it mixes with the plants. Could you not carry it through the chamber of your bed before the air is discharged into the house? You do not want to introduce cold air into either stove or greenhouse; it is fresh air that is required.

Henbane.—*M.*—This loves deep sandy land. It should be sown at Midsummer or a little later. It is fit for gathering when in full growth the following year, while in flower and before it becomes at all yellow. Then it must be dried gradually in the shade. The seeds are the most active part.

Insects.—*B. B.'s* insects are the common cockroaches. The best mode of reducing their numbers is to keep a hedgehog in the infested apartment. *R.*——*R. T.*—We are much obliged. The aphis inhabiting the roots of the Lettuces is the Eriosoma lactucæ. *R.*——*G. I.*—Your spider's-web is very remarkable, and we presume it was found in a wall which the ants inhabited. We shall feel obliged by your giving us the particulars, and sending one of the spiders. You are aware that what are called ants'-eggs are the cocoons. *R.*——*W. R.*—The Elder-tree is infested with plant-lice called Aphis sambuci, which appeared early on the Elder-shoots this season. *R.*——*J. Wighton.*—The curious insects taken from the wasp's nest are females of a beetle called Ripiphorus paradoxus, figured and described in Curtis's Brit. Ent., fol. and pl. 19, 2d edit., where you will also find their history; and at fol. 198, that of a parasite named Anomalon vesparum. *R.*——*B. Chilo.*—Your grub is probably the caterpillar of Noctua meticulosa; but you should have said what it fed upon, that we might rear it, and ascertain the species. *R.*——*M. C.*—The little scarlet insects are the Acarus autumnalis; they inhabit Grass fields, Kidney Beans, &c., and are very troublesome in August and September by causing little tumours in the legs, with insufferable irritation. *R.*

Local Horticultural Societies.—We learn that the statement that the Eltham Horticultural Society was dead arose from an error of the press, our correspondent, "F. H. S.," having written Elham, a place between Canterbury and Folkstone. "F. H. S." much regrets that this should have given pain to the lady who acts as secretary at Eltham.

Manure.—*Experimentalist.*—We are obliged to make it a rule not to recommend tradesmen, unless there should be some urgent necessity, and must therefore refer you to our advertising columns. Humphreys's compound is nitrate of ammonia, with a minute quantity of phosphoric acid, as has been lately shown in former Numbers of this Paper, to which we must refer you. Liquid guano may be given advantageously to all kinds of flowers, provided the dose is not too large. Roses can hardly be over dosed with it; herbaceous plants may be, because it will make them run to leaf if there is too much of it. The rule for applying liquid manures of all sorts is to do it when plants are growing, and in small quantities frequently repeated. To apply manure when plants are not growing is to waste it. No doubt your fruit trees would be improved by the addition of any sort of manure. Is not their soil too dry? If the Mulberry does not ripen its fruit, you must have a very bad climate; or a very cold bottom, and we can suggest no remedy for those difficulties.——*Suburban.*—Our observations were applied to manure and not to heating apparatus. When stable-litter is heaped over Sea-kale it does not act as a manure, but as a heating material.——*A Constant Subscriber.*—Nitrate of ammonia is a very powerful agent, and must be used with caution, or it will kill plants instead of curing them. The best way of applying it seems to be to dissolve about a teaspoonful, or even less, in a common watering-pot full of water.

Morphology.—*W. V.*—Your Cucumber is only an instance of a leaf accidentally growing to the side of the fruit. It does not arise from any breaking up of the system. Such cases are not unusual.

Names of Fruit.—*L. P. F.*—No. 1. Alfriston; 2. Kerry Pippin; 3. Keswick Codlin; 5. Downton; 7, Bedfordshire Foundling; 8. Scarlet Nonpareil; 10. Margil; 11. Court of Wick.‖——*Miss S. S.*—No. 1. Alexander; 2. Golden Pippin; 4. Nonsuch; 5. Hollandbury. The Plum No. 6 does not appear to be any of the grafted varieties; it resembles the Wine-sour.‖

Names of Plants.—*R. G.*—Warrea tricolor.——*H. P.*—Your plant is Portulaca splendens. It shows you how much the Linnæan System is liable to exceptions. The species of Portulaca vary greatly in the number of their stamens.——*B. T. S.*—No. 1. Lepidium campestre; 2. Thlapsi arvense; 3. Rubia peregrina.§ ——*P. J. O.*—Apparently Fuchsia Thompsonii.*——*B. B. C.*—We assure you that Grasses cannot be named unless in flower.——*Eltham.*—Not a plant, but Oak-spangles, which are described at p. 52, vol. 1843.‡——*F. F.*—Your Fungus is a smooth state of the Scleroderma vulgare, resembling very much Scleroderma geaster, a species which has not yet been found in Great Britain. Smooth specimens of Scleroderma are often confounded with the White Truffle, and in Belgium, where they abound, are collected and sent to Paris, where they are substituted for the real Perigord Truffle, greatly to the annoyance of the *bon vivants*, who complain that the Perigord pies are not what they used to be. *M. J. B.*——*W. D.*—Zephyranthes Atamasco.

Peaches and Nectarines.—*M. D.*—The excessively dry weather, together with the very severe attacks of the red spider, has, in many instances, occasioned the premature dropping of these fruits.‖

Pelargoniums.—*An Amateur.*—The following sorts will improve your collection:—Beck's Susanna, Garth's Witch, Pulchellum, Sultana, Foster's Sunshine, and Sir R. Peel. We are not aware to whom the Pelargonium named Fair Rosamond belonged; probably the advertisements will soon make it known.*

Removal of Roses and Ornamental Shrubs.—*D—t.*—These cannot be removed by a tenant quitting, unless he is a gardener. *W.*

Sulphate of Iron.—*Anon.*—Sulphuric acid will fix ammonia perfectly, and if that is all your object there is no use in employing sulphate of iron. The object of employing the latter is to sweeten manure, partly by fixing ammonia, and otherwise by decomposing the intolerably offensive sulphuretted hydrogen. We presume rather more than twice as much sulphate of iron as sulphuric acid will be required.——*A Constant Reader.*—This dissolves readily in cold water. If to be added to putrid fluids, it may be dissolved in just as much water as it requires and no more. But if it has to be applied to solid masses, then it should be largely diluted, or it will be wasted; say in the latter case ½lb. to a gallon of water. It is not probable that any animals would lap it up, because of its unpleasant taste; but it is as well not to leave it about. In small quantity it is hardly a poison.

Tulips.—*B—k—g.*—Refer to No. 24 of the *Gardeners' Chronicle* for the present year, p. 383, and you will find the information you seek about Tulips. Change of soil and situation afford the best chance for breaking them.*

Underwood.—*H. W.*—The best description of shrubs to be placed in a plantation of large trees to fill up the blank appearance of the ground, is Privet, Holly, Common Laurel, Blackthorn, Buckthorn, Yew, and Furze, or Broom.

Vines.—*Clericus.*—Follow Mr. Roberts's advice. If you get them forward before planting them out in March, you must be very careful to mulch the ground all round their roots with plenty of warm stable litter. The grand thing this year is to get the wood thoroughly ripe, and that can only be done by keeping them in a hot, dry, airy situation until the wood is hard.

Yellow Picotees.—*B—k—g.*—Procure the following sorts:—Barraud's Favourite, Euphemia, Wilson's Isabella, Willmer's Romulus, Rajah Ramahun Roy, Khouli Khan, Charles X., Brocks' Prince of Wales, Queen, Mars, Lady Chetwynde, Countess Ashburnham. Save your own seed.*

Miscellaneous.—*A. E. D.*—We cannot name your Gesneras by description. Amicia zygomeris is an odd-looking, rather handsome yellow-flowered papilionaceous plant. Tremandra Hugelii is a pretty greenhouse bush; Drymonia punctata is a curious stove trailer, with the habit of a Columnea.——*A Subscriber.*—The Isle of Wight, like all islands, is much warmer than the mainland, and is also sheltered by it; and then its coast lies high and dry; both which circumstances sufficiently account for the mildness of its winters. Arbutus seed may be obtained from old trees in this country; Bay and Myrtle seeds from Italy. All such things are troublesome to procure, because they are not common articles of trade. We regret our inability to assist you. If they come into the market, any nurseryman will know how to obtain them.——*Ortolano.*—Phormium tenax likes a fresh, loamy soil, dry in winter and damp while it is growing. Silene maritima is growing luxuriantly in a stiff, loamy soil, just before our windows. Winter Savory is Satureia montana.——*P. J.*—Of course they will be advertised.——*Dianthophilos.*—Neither of the specimens you have sent is the true Clove Pink of our gardens; they are not the true colour, nor do they possess the delicious spicy fragrance of this old favourite, which is of a rich red maroon colour. Your blooms are purple, and nearly scentless.*——*A Novice.*—Your Fuchsias, lately removed to the open ground, that are becoming sick, and whose leaves are turning brown, have not been sufficiently supplied with water. Fuchsias are thirsty plants, and should be well attended to in this respect, or they very soon lose their leaves.——*Clericus.*—The chief thing to be attended to in plants for winter or early spring flowering, is to get the wood thoroughly ripened. After that they may be introduced into heat at any time. Pelargoniums cut down in June last may be made to flower next February or March, if they are forced.‡——*C. M.*—In striking cuttings of Fuchsias, at this season of the year, it is advisable to place them on a slight hotbed.——*W. C.*—To your conservatory climbers you may add Ceanothus azureus, blue; and Passiflora Loudoni, crimson.‡——*B.*—Rhododendron lapponicum, chamæcistus, and chrysanthum, are among the very rarest plants. By all means preserve them in pots during the ensuing winter in a cold pit, which you can keep free from too much damp. Place them near the light, and give them air whenever you are able.——*A Reader.*—Much information respecting Vegetable Ivory is given at p. 836, vol. 1842.‡——*A Subscriber.*—The directions respecting the preparation of ground for Asparagus, given at p. 544, are good; but by adding a little more manure, if you have plenty of it, the plants will grow all the better, provided you do not put it too thick, as in that case it is apt to become soddened and rot the plants.‡——*A Beginner.*—Strawberry-plants for forcing, when taken from the striking-pots (60s.), are generally shifted into 32s. We do not consider that they would do better for having an intermediate shifting into 48s. There is no better way of destroying green-fly in a Cucumber-frame than smoking them with Tobacco, provided the operation is rightly performed. It should be done when the leaves are dry.‡——*B. F.*—It is published in time for the morning mails.——*Amicus.*—Messrs. Lane and Son, Berkhampstead.

SEEDLING FLOWERS.

Carnations and Picotees.—*P. C.*—20, a bizarre Picotee, with yellow ground; the flower is large and full, with a good crown, and large guard petals; but the edges of the petals want smoothness, and the colour is too much distributed over the surface of the petals; it is a good border variety. Of the two lemon-coloured selfs, 12 is decidedly the better of the two, the petals being larger and stouter than in 13; but seedlings like these are very common.*

Dahlias.—*J. R. R.*—Your seedling is of a good colour, but the petals unfold irregularly; the centre is also confused and deficient in petals; it shows the yellow disk.*——*W. A.*—Your *Islington Rival* is a very promising specimen; the arrangement of the petals, their form and substance, are good, and the eye is well elevated; it is a compact and finely-formed flower; colour, deep maroon.*——*T. R.*—The bloom of your white Dahlia had broken short off, and was much bruised and damaged. The petals are of a good form, and well arranged, and the flower is of a good general form; the centre in the bloom sent was imperfect, and we fear this part of the flower will prove too thin.*

Fuchsias.—*J. W., Pittlessie.*—Your seedling No. 1 is an elegant flower, of good texture, and though wanting the violet colour in the corolla, it still makes a pleasing variety.*——*J. H. C.*—The form of the bud of No. 29 is curious, being so perfectly globular; but it possesses no other qualification to recommend it to general cultivation. 54—Tube and sepals bright carmine, smooth and shining, but the corolla wants colour, and it is no improvement upon globosa major. 83—Not sufficiently compact, and deficient in colour. 99 very much resembles Venus Victrix, but not equal to that variety, from the corolla possessing less of the violet colour, and the tube and sepals not being so light. 64 is very pretty, and singular in appearance, from the corolla being of a very peculiar colour (a dove colour), with delicate pink tube and sepals, tipped with green; an elegant little flower.*——*R. and S.*—Your seedling 1-44 is a showy and desirable variety; the tube and sepals are of a light delicate flesh tint—the latter with green tips; corolla rosy vermilion; flower-stalks long; the largest of its colour we have seen.*——*Y. Z.*—Your seedlings are very good flowers—fine in texture and good in colour. The violet purple corolla in No. 1 forms an excellent contrast with its bright carmine tube and sepals; this is a large and elegant flower. 2 is also a large and fine flower, with less violet in the corolla. Next to this we place 7, as the colours are more brilliant, and the form more graceful than 3, which is rather a stouter and larger flower; in the two latter specimens there is not so strong a contrast in the colours, and they much resemble each other. 6 is an elegant flower, with a fine violet corolla, but not superior to some of the older sorts in cultivation; the same observation applies to No. 4.*——*W. D. B.*—The seedling from fulgens which you have sent is a very handsome variety; the bunches are large, the one sent containing more than 80 flowers, the tube of which is slender, of a delicate flesh colour, with pale-green sepals; the corolla is of a bright vermilion, seen in the spaces between.*——*Clericus.*—Your Fuchsia is a very good flower, rich in colour, and of a good shape; it, however, wants novelty, and there is nothing sufficiently distinct from other varieties to render it preferable to them for general cultivation.*——*J. H.*—Your seedling in form is better than those we are in the habit generally of seeing, it is also good in colour and moderate in size; it, however, bears too strong a resemblance in its general appearance to some of the sorts lately introduced, particularly in its want of violet in the corolla; nevertheless, if the habit be good it is worth growing, being a finely-proportioned flower.*

Lobelia fulgens.—*F. B.*—Both your seedlings are very handsome varieties, particularly *L. fulgens multiflora*, the lip of which is large and broad, of a rich and dazzling scarlet. *Fulgens pyramidalis* is also a fine variety; not so large as the former, but of the same brilliant scarlet. They are both very desirable flowers.*

Mimulus.—*J. W. E.*—Your seedlings do not differ from other varieties we have seen; the orange, No. 7, and the scarlet, No. 6, are the best; the other colours are what we generally see in all collections raised from seed.*

Pansies.—*W. H. M.*—Your seedlings are inferior to sorts similar in character; 1 is too long in form, and 2 is poor in colour.*

Petunia.—*X. Y. Z.*—Your seedling reached us in such bad condition, that the shaded appearance to which you allude could not be perceived.*

Pelargoniums.—*J. C.*—Your specimen wants both size and substance.*

Phlox Drummondii.—*S. G.*—The two specimens sent—seedlings from your variety named *splendens*—are fine in colour, and the lighter variety is good in form also.*

Verbenas.—*T. C.*—Neither of your seedlings appear to be new or striking; the rose-coloured variety is very pretty in colour, but rather deeply indented, and the divisions curl about, which gives it a confused appearance; the light variety wants novelty.*——*S. G.*—The best seedling in your collection is one named *Rose d'Amour*; this is distinct in colour, being of a bright and lovely pink colour; a large and good flower. *The Lovely Rambler*, light lilac with pink eye, is also a good flower. *Messenger*, a good lilac, too much resembles some of the older varieties. *The Giant*, a light lilac with dark eye; the head of the flower is large, but the colour wants clearness; and *Mulberry*, though a good flower, is surpassed by others in cultivation. *Rubescens* and *alba lutescens* are not worth cultivation, in the present improved state of this flower.*

Erratum.—In Mr. Miller's advertisement of Seedling Geraniums, inserted 24th August, the price should be 6*s.* for 50 seeds, and not 5*s.*

SEED-WHEAT. — Any one desirous of obtaining Seed Wheat for use this autumn, may ascertain, by application to me, the particulars of the crops of two excellent varieties—Shirreff's Hopetoun, and Morton's Red-Straw White, which have been grown on
WHITFIELD FARM, THORNBURY, GLOUCESTERSHIRE,
during the last 3 years. This year's crop is on sale at 8*s.* a bushel.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, Sept. 5] Agricultural Imp. Soc. of Ireland.

FARMERS' CLUBS.

Sept. 2 Usk. | Sept. 10 Abergavenny.

THE ECONOMICAL VALUE OF ANY FARM IMPLEMENT—if, for the moment, we disregard its cost price—depends, first, upon its efficiency—*i. e.*, the degree in which its work approaches perfection; and secondly, upon the expense connected with its use—*i. e.*, the horse-power and manual labour required in working it. There are thus two subjects of inquiry connected with every machine, viz., its construction, first, as affecting its efficiency, and secondly, as affecting the power required to work it.

Let us take up the consideration of a particular class of implements; the first to which our attention is naturally due are those of cultivation. All these, including draining-ploughs, subsoil-ploughs, common ploughs, harrows, scarifiers, grubbers and horse-hoes, rollers and clod-crushers, admit of this two-fold consideration, and require it in order that their real value or usefulness to the farmer may be fairly estimated. There are a great many forms of all these implements: that is the best of each, in which excellence of work and lightness of draught are united in the most profitable proportion.

In estimating the efficiency of the different implements which claim our notice, we shall have to consider the object for which they are used, and how far they are respectively successful in effecting it. This will be better done when we come to describe them each in its turn. At present, we may make a few remarks on the other subject, which we have said affects machines generally—that of draught, and on our present means of measuring it in farm implements.

The first AGRICULTURAL DYNAMOMETER, and till lately, we believe, the only one in use, consisted simply of an elliptic spring; and the degree in which this spring collapsed, on being pulled asunder lengthwise, was taken as an index of the strain to which it had been subjected. One of the sides of the ellipse being fastened to a metallic plate, on which the spring lies, its collapse, on subjecting it to a longitudinal strain, (as, for instance, by making it a link in the draught-chain of a plough,) causes the other side to approach it, and this motion is communicated by means of rack-work and pinion, or by a compound leverage, to a radial index on the other face of the metallic plate, where a circular scale, to which this index points, has been divided, by previous trials, into cwts. and stones. The position of the index on the scale is thus indicative of the amount of longitudinal strain to which the spring may be subjected. If it be attached to a plough, the effort of the horses in drawing the implement through the ground will be exhibited by the position of this index; for when the strain is greatest, as where the ground is hard, it will, owing to the greater collapse of the spring, point to a greater number of cwts. and stones as the measure of the horse's exertion, than when the soil being loose the implement is more easily pulled through it. This instrument has been a good deal used in determining the draught of ploughs, but with little service, owing to the extreme variability of the strain which it is here required to measure. The density of soil, as the plough is drawn through it, is so rapidly and incessantly variable, that so far from being able to judge of the average draught from watching the rapidly-oscillating index of this dynamometer, the operator is unable to state at any one time what the position of the index actually is. In order to remedy this defect in this instrument, Messrs. Cottam and Hallen, of Winsley street, London, have contrived a modification of it, of which the following is a figure. A cylinder and piston, represented in section, are here interposed between the two sides of the spring by the same system of levers which work the index, and the motion of the piston is rendered difficult by the cylinder being filled with oil, which must pass through small holes pierced in the piston before the latter can shift its position. A sluggishness is thus imparted to the index, which allows its average position to be more accurately estimated. Still, however, in using this instrument, the operator has to depend a good deal on his own judgment in pronouncing what the draught of the implement under trial is; and this is an imperfection.

Instead of attempting to destroy these oscillations,

COTTAM'S DYNAMOMETER.*

much the better method is to adopt an arrangement by which they may be recorded by pencil on paper, in the same way as in anemometers the variable force of the wind is recorded. Mr. Clyburn, engineer to the Earl of Ducie's iron works at Uley, Gloucestershire, has constructed an instrument on this principle, which is represented as at work in the subjoined figure.

CLYBURN'S DYNAMOMETER.†

The spring in this case is spiral, and the strain which it is intended to measure is made to compress it. The motion of the plough is communicated by means of the wheels, which hang from the instrument and roll on the ground, to a cylinder within the case of the spring, and as this revolves it unwinds and rolls up a strip of paper which is wound on another cylinder close by it, within the same case. This paper is marked as in the following figures, with transverse (vertical) and longitudinal (horizontal) lines, the one corresponding to the positions of the dynamometer's index, under the strains successively of 1, 2, 3, 4, &c. cwts., and the other dividing the paper into sections of a width corresponding to 25 yards of ground passed over, as calculated from the size of the wheels communicating the motion of the plough. As already stated, when the power is applied, the spring is compressed, and this gives motion to a rack and pinion that has a pulley fixed on the same spindle; this pulley has a chain passing round it, which gives motion to a pencil and pointer; the pencil oscillates in a line, parallel to the cylinders just described, and it is kept by a spring pressing upon that cylinder, which, as the plough proceeds, is winding up the strip of paper which we have been describing. The consequence is, that the paper carries off, marked upon it, an irregular line, the position and character of which depends upon and indicates the intensity and irregularity of the strain to which the spring has been subjected. The curious and interesting figures below are reduced ($\frac{1}{3}$) from actual drawings by the pencil of this dynamometer when attached to two different ploughs.

They make good our remarks as to the extreme variability of the draught of implements of cultivation, owing to the variable density of the soil. We

do not know of what ploughs these record the draught, nor whether they were working at the same depth in similar soils at the time; but it is evident that they are far more instructive than the most lengthened and detailed description, of the nature and intensity of the effort which the horses made in drawing the implements through the ground.

We see that the draught of the first plough averaged 4¼ cwts., and that of the second not more than 2¾ cwts.; the draught, also, of the first plough is obviously more intensely, but not more rapidly variable than that of the second. We hope hereafter to be able to lay before our readers an Essay on the draught of some of our best English and Scotch ploughs under similar and under variable circumstances—written, not by ourselves, nor by any other experimenter on this subject, but by the unerring pencil of this dynamometer; and we are sure that a simple examination of the paper of Clyburn's dynamometer, after being applied to different ploughs working at various depths in various soils, will be far more interesting and instructive than a detailed description of the trial by a most accurate and attentive observer.

We hope to be able to inform our readers, as we proceed, of the draught taken by this dynamometer of the different machines we describe.

GEO-AGRICULTURAL NOTES ON SOUTH GLOUCESTERSHIRE.

(Concluded from page 578.)

Marlstone.—Below the sands of the inferior oolite lie a series of beds which, near Dursley, where they are most fully developed, consist of an indurated sand, containing vast numbers of shells. This rock, which receives the name of Marlstone, is generally of a light-brown colour, while the shelly concretions which everywhere pervade it are of a grayish blue. It is exceedingly tough, and is extensively used as building material. Immediately above it, and separating it from the sand of the lower oolite, a very thin bed of clay occurs, containing thin layers of limestone rock, precisely resembling the lias limestone. It frequently is not easily traceable, from being here and there obscured by overlying debris; a very excellent section of it, however, may be observed on descending Frocester Hill, towards Coaley Hamlet; after passing the limestone, and then the sand of the inferior oolite, we there find that they rest on this stratum, averaging 10 or 12 feet in thickness, of a light-coloured clay, in which as many as a dozen courses of a grayish limestone, each not above 3 inches in thickness, occur. This bed is also well seen at Tick's Hill, below Coaley Wood, and at Waterleigh Valley, on the other side of Stinchcombe, in each of which places thin limestone beds are to be seen. It is also seen at Horton Hill, where it is a dark-blue clay; and it is visible at intervals along the foot of the hills between these places. The junction between the marlstone and sand of the lower oolite is easily traced when this bed of clay which separates them is visible. This, however, is not everywhere the case, and, therefore, though at Dursley, where the character of the rock is well developed, boundaries are easily traced, this is not easily done near Bath, where its character is much altered. At Dursley the marlstone forms an extensive terrace, stretching out from the foot of Stinchcombe Hill half a mile into the valley; beyond Wotton-under-Edge, however, and in the southern part of our district near Bath, it does not form so important a member of the oolitic series, being thinner, and losing the indurated and rocky character of the Dursley rock; and as the bed of clay above it there disappears, or is not easily traceable, it is not easy to distinguish it from the sand, which there occupies so considerable a portion of the escarpment. The section at Frocester Hill just noticed, exhibits also the character of the marlstone. It there consists of a series of beds of rock, of the character described above, from three to thirty feet thick, alternating with beds of blue and brown marl, varying from ten to twenty feet in thickness, and comprising in all a thickness of about 100 feet. Not far from this section the bed of clay above the marlstone is of a dark colour, which, many years since, gave rise to the idea of the then proprietor of the land, that, probably, coal was not far off, and trials were accordingly made. A shaft was sunk, which, of course, has been long since filled up, but the mound of the material excavated still remains, a monument of the geological ignorance which then existed.

* The price of this instrument is 7*l.* † Price 14*l.*

Agricultural Character of the Marlstone.—The bed of clay above the marlstone is of very little agricultural importance, being of such insignificant extent. In one field—the only arable one in which I know it to be exposed—the soil is full of fossil shells of the ammonite. It is a clayey soil on which good crops of Wheat are raised. Clover seeds with Rye-grass have frequently been tried on it, but, with the exception of one corner of the field, which is lower than the rest, where the marlstone is exposed, they have uniformly failed. The Rye-grass sown along with them, however, grows well. The soil on the marlstone differs from that on the upper ias in being lighter. It is a sandy loam of variable depth, and is wet or dry, according as it overlies the calcareous sandstone or the clayey strata of the rock. When dry it is one of the most fertile descriptions of soil occurring in the district. The general rotation over the Dursley district, where the land is chiefly arable, is one of three years' duration. Wheat is followed by Barley or Beans, and that by seeds or Potatoes; a portion of the land being near the rock, and therefore brashy, is well suited for the growth of Barley. The heavier portions, again, are adapted for the growth of Beans. No Turnips are cultivated in this district. The common field system exists over a great portion of it, and the right which, under this system, certain of the proprietors and occupiers in the several parishes have, of folding their stock over the whole of the uninclosed land during winter, effectually hinders any attempts at Turnip culture. The average of the several crops is as follows:—Wheat per acre, 26 bushels; Beans, 30 bushels; Barley, 30 bushels; Potatoes, 70 sacks. The general seed-time is needlessly late. Barley sowing, for instance, rarely commences till the month of May; the period of harvest is consequently late. Wheat is generally harvested by the end of September. Beans by the middle of October; and it is thought sufficiently early if the Potatoes be housed by the time of Dursley Fair, which occurs on the 4th of December.—*M.S.*

ON FLAX SEED AS FOOD.

In a series of Papers which have already appeared in previous Numbers of the *Agricultural Gazette*, the cultivation and management of Flax have been minutely described; but as the application of the seed on the farm has lately attracted much attention in several districts in England, it has been suggested to me that it would be desirable to place that subject more prominently before the public than I have already done. With a view of procuring further information in this new and important department of husbandry, I have lately, in a visit to certain parts of the eastern counties, where attention has first been prominently directed to it, had an opportunity of seeing Flax-seed extensively and efficiently employed for this purpose, and the results of this it is my present purpose to place before the readers of this Journal.

The practice described in the Papers referred to in the preceding paragraph is that recently introduced into Ireland by the Belfast Flax Improvement Society, and it will be seen from a perusal of them, that the production of fibre is there regarded as the especial purpose for which the crop is cultivated, the seed being entirely a secondary consideration. In the majority of cases, indeed, so little importance has hitherto been attached to the seed that it has been entirely disregarded, partly from the circumstance of its value not being understood, and partly, also, from an erroneous opinion being entertained that the saving of the seed would be injurious to the fibre. Under these circumstances it will be perceived that the full value of the crop was not taken advantage of, and from the returns thus obtained no just estimate of the value of the Flax plant could be formed. This will be more apparent when it is considered that in circumstances unfavourable to the production of fibre an extra quantity of seed will be obtained, and *vice versâ*. Properly speaking, therefore, where advantage is taken of both products a failure can rarely be experienced, although where only one or the other is regarded, such an occurrence may be expected occasionally to take place. Where the fibre only is the object of cultivation this is more especially the case; and this circumstance caused the extent of land appropriated to the growth of Flax in Ireland to become annually less, so that without the intervention of the vigorous measures resorted to by the Belfast Flax Improvement Society, the cultivation of Flax, one of the staple productions of Ireland, would soon have been known only in name.

The defective management so long practised in Ireland resulted chiefly from ignorance as to the value of the seed apart from its application for the purpose of reproduction. Until lately, the husbandry of that country was wretchedly defective in every particular. The domestic animals were for the most part dependent for food on the spontaneous productions of the earth, little attention being paid to the growth of green crops. Under these circumstances it may be supposed that the use of oil-cake was entirely unknown. In this country, however, where improvements in cultivation scarcely kept pace with those effected in the rearing and feeding of the domestic animals, oil-cake has long been extensively used, and justly esteemed as a rich and nutritious article of food; and the Flax-plant not being generally cultivated here, large importations of that article annually took place. The oil-cake is well known to be the refuse of the Flax-seed after the oil has been expressed; the money-value of these ingredients being nearly in the proportion of one to four in favour of the latter. The value of the seed as an article of food before expression is therefore apparent; and it is not a little singular that it should have hitherto been so little employed for this purpose.

It is a curious coincidence that while exertions were being made in Ireland for the improvement of the growth of Flax, having reference chiefly to the production of fibre, attention was in this country directed to its cultivation for the production of seed, the fibre being disregarded, or at all events being a secondary consideration. Indeed, the returns obtained by Mr. Warnes, of Norfolk, from the seed alone, are much greater than those usually realised in Ireland from the fibre; and that gentleman has satisfactorily shown that without taking the value of the fibre into consideration at all, the Flax plant could successfully compete with other cultivated crops. The latter is, however, too valuable to be disregarded in any case, as, how ever inferior in quality it may be, it can still be profitably disposed of to the manufacturer.

Flax is usually regarded as a highly exhausting crop; and this opinion, has, in many cases, retarded the extension of its culture, even where the returns obtained from it were sufficiently remunerating. That it is in a greater or less degree an exhauster of the soil must be admitted; and this quality may be supposed to be increased by allowing the seed to ripen fully before taking up the crop; but the consumption of the seed on the farm will alter the character of the crop in this respect, and render it restorative instead of exhausting.

The process of saving the seed has been already described at length, and need not again be further adverted to, the present paper merely relating to its application as an article of food. It is perhaps unnecessary to apprise the reader that this subject was first prominently brought before farmers by Mr. Warnes; and after a perusal of the statements and experiments in the sequel it will be seen that he has laid his countrymen under very considerable obligations for his exertions. Having ascertained the advantages to be derived from the system, he persevered in advocating its extension until a society was organised in Norfolk for the purpose, which at present has numerous auxiliaries in connexion with it in Norfolk and Suffolk; and considering that the culture of Flax was previously unknown in that part of the country, and that the management to be adopted in almost every stage of it is very different from the usual farming operations, it must be regarded as not a little extraordinary that the extension of the crop has proceeded with undeviating regularity, and that fields of several acres may be frequently seen throughout the districts over which the influence of these societies extends. Although the seed is there the principal object, the preparation of the fibre has not been forgotten. In this respect, the example of the Belfast Society has been imitated, the services of Belgian and Irish operatives having been secured to teach the different processes of the manufacture.

Flax-seed has been found to be equally suited to the different animals of the farm, for all of which it is a nutritive and valuable article of food. It is not available for this purpose in its natural state, as, if given whole, it would pass through the animals almost unchanged; nor can it in any case be given in large quantities, for then the effect of it would be at once to subject the animals to violent purging. It is also necessary that it should be combined with other matters of a less nutritive character, in accordance with the established fact in the animal economy, that the ingredients necessary for the support of life are not advantageously used in a highly concentrated form, and that quantity no less than quality must be regarded. The Flax-seed is ground into meal, and at once combined with the other ingredients, the whole being afterwards boiled or steamed, or it is boiled alone with water, and then merely mixed with the other matters.

The indirect advantages obtained by the consumption of Flax-seed on the farm are various. It is well known that the chief difficulties to be contended with on the heavier class of soils—and these constitute a very considerable portion of the surface of the country—is the production of a sufficient supply of nutritious or green food to be consumed with the refuse grain and hay and straw; but this difficulty may in a great measure be removed by the use of Flax-seed. It will render any mixture of these, however coarse, sufficiently nutritious, not only for feeding, but for fattening. Though adapted to a wide range of soil, Flax is best suited to those of the heavier class, and it is on these also that the production of green food is the greatest desideratum. Great difficulty is usually experienced on such soils in converting the superabundant supply of straw into manure, as no considerable portion of it can be consumed by the domestic animals by itself; by the aid of Flax-seed, however, it may all be converted into nutritious food; and when such combination is extensively used, every exertion will be required to economise the refuse matters for litter, instead of otherwise ineffectually attempting to convert them into manure.

The use of Flax-seed may further be made auxiliary to the extension of the practice of soiling or house-feeding during the summer. The advantages of this system of feeding are well known, as economising the supply of food, by which an increased number of animals can be maintained; and also as greatly adding to the stock of manure, and consequent increase of fertility in the soil. On all the inferior kinds of soils, soiling has hitherto been found impracticable, the natural produce in such cases not being sufficiently nutritious for the maintenance of animals in a state of confinement; but here the aid of Flax-seed may be rendered available, as the jelly produced by boiling it, combined with the coarsest Grass, will form a nutritious compound, relished by every species of live stock. It will at once be perceived that the use of Flax-seed will add, among other advantages, in a great degree to the fertility of the soil, by the production of a greatly increased quantity of manure, and that of a very superior quality. In no other respect, perhaps, can it be regarded of more importance than in this, as the increase of the productive powers of the soil should be steadily kept in view.

Premising these general remarks on the subject, it will perhaps be more satisfactory to the reader to detail the management adopted in the use of Flax-seed, with some of the results thereby attained. Here a reference to facts is necessary; and for this purpose I shall describe the system followed at Horkesley Hall, near Colchester, by the Rev. Mr. Blair Warren, to whom I am indebted for many of the statements which follow, which may therefore be implicitly relied on. Though long aware of the value of Flax-seed as an article of food for live stock, I cannot forbear expressing the surprise and great gratification which I experienced in the inspection of the system of feeding at Horkesley, where sheep and other stock are fattened with a proportion of Flax-seed jelly, both in houses and out of doors.—*J. Sproule.*

(To be continued.)

NOTES OF A JOURNEY THROUGH SOUTHERN AND WESTERN ENGLAND.

I do not pretend either thoroughly to know the English farming, or to be capable of entering into a minute investigation of its merits or demerits, for I have spent little more than ten days in the country, and those have been chiefly occupied in travelling on railways and coaches; but there are various points so obvious as to strike the eye of the most cursory observer.

The following remarks have reference to Berkshire, Wilts, Gloucester, Worcester, Stafford, and Cheshire. On leaving London by the Great Western Railway, and proceeding through Middlesex to Reading, we pass through a fine, level, rich country, a considerable extent of which is in crop, principally Wheat, which presents a good appearance, and (August 3d) is mostly ripe; Oats are generally a light crop. To the west of Reading the railway runs through cuttings of chalk, mixed with flint nodules; at the Oxford junction line the soil is poorish, low-lying, and mossy; from that to Chippenham is a fine country, lying chiefly in meadow Grass, subdivided into small fields, surrounded by hedge-rows, ditches, and trees; around Chippenham it is hilly and rather poor, and on to Bristol still hilly; between Bristol and Gloucester is a fine undulating country, still principally in Grass.

I believe I am correct in saying that in the whole of the country named, and on to Birmingham and Liverpool, there is not above one-third in crop, if so much; and the remaining two-thirds are lying in meadow Grass, a portion cut and made Hay, the rest pastured; the modern improvements of draining, soiling cattle, proper rotation of crop, including Turnip, Clover, and Rye-grass, deep ploughing and thoroughly cleaning the land, seem to be anything but generally adopted. When we see the fields laid out into ridges of 2 or 3 yards in breadth, the furrows in many instances being almost bare of crop, how can we account for it but on the supposition of the land being wet? Again, I do not think I exceed the mark when I say, that for every 10 acres of surface there is 1 acre rendered useless—nay, worse than useless, absolutely injurious—by hedge-rows, ditches, and trees; almost every paltry field of 2 or 3 acres must have its hedge and ditch, and in very many instances its row of trees. Did these hedges do no more harm than occupying the ground, they would be bad enough; but they afford shelter and nourishment to all sorts of weeds, insects, and vermin, rendering it almost impossible for the farmer to keep his land clean: untouched, they furnish annually a crop of seed-weeds, blown by the wind through the fields, defying all attempts to keep the land clean; and when the field is in crop, if the season happen to be at all wet, the crop must be lost from the want of a free circulation of air.

When travelling on the Great Western Railway, we heard some people remark, they would rather see the fine green fields of England, with her hedge-rows and trees, that contribute so much to beautify and adorn her, than see nothing but corn fields. Utility, however, before ornament, say we, so long as England cannot grow corn enough to support her inhabitants. While we have the strange anomaly of plenty of capital with a superabundance of labourers, vast numbers of whom are bordering on a state of destitution; when so many of our countrymen, finding it difficult to earn a subsistence at home, are annually emigrating to other countries, and seeking to themselves a home in remote quarters of the globe—it seems strange that so large a portion of the fine and fertile soil of England should remain only half cultivated; that we should assist in exporting our countrymen to reclaim wild land in America and Australia before first properly cultivating our own.

In travelling through these counties one is surprised to see in some parts ploughs (large, clumsy, wooden articles, with two large wheels fixed at the end of the beam) drawn by three or four horses in a line, with a man or boy besides the ploughman driving the horses; and one can hardly restrain a laugh at such a needless waste of animal labour, knowing that two horses will in general do more work yoked abreast to a plough than four yoked before each other in single file, because some of the power of the foremost horses is always wasted in its passage along the sides of the hind horses, and when turning, the hindmost one has the whole draught to bear. In Scotland, and many well-cultivated parts of England,

all ploughing, except perhaps subsoiling, whatever be the land, light or heavy, is performed with but two horses yoked abreast; and with a properly-constructed plough these are found amply sufficient.

Having now run over shortly what I think are the leading defects that struck my notice in my short journey, let me as shortly point to the leading remedies:—First, then, the landlords as a body ought to grant long leases of 19 years at least, and on grain rents, or at so many bushels of grain per acre, at the average price of the county; for what man will invest his capital in improving land, without having a vested right in his improvements? or who would run the risk of spending his means in draining or otherwise improving his farm, with the liability instantly after of being turned adrift at the mere caprice of his landlord? The landlords should also take upon themselves the payment of the whole burdens, whether in the shape of tithes or poor-rates, &c., so that the tenant would have a fixed rent before him, and have nothing to fear—nothing to prevent him laying out his capital to the best advantage. The law of hypothic should also be abolished. This was enacted for the protection of landlords, but it is very questionable if it does not react upon themselves, by preventing the tenant from borrowing money to carry on improvements in the same way as other classes of the community. If a manufacturer, for instance, has 1000*l.* on machinery, he finds little difficulty in borrowing money to the extent of at least half its value; not so the farmer. Who will lend to him, when his landlord has a preferable claim on the property?

The next thing to a proper cultivation of the soil is a sufficient supply of manure; and this cannot be procured without keeping a large stock of cattle, for which in the counties named there is no means of subsistence: to overcome this difficulty it is necessary, instead of as at present having two-thirds nominally in Grass but in reality producing little, to introduce green crops, crops of artificial Grasses, Turnips, and other roots; for it is well known that the same ground which in poor pasture would only feed a few cattle in summer, will, under the crops mentioned, feed three or four times the number all the year round, if they be kept in the house, the food being brought to them: three or four times the quantity of manure will thus be produced. Again, take a farm of 300 acres, only one-third of it being cultivated, the remainder in Grass—how few people are employed here! Change the system, and we have three or four times the number employed. Were this universally adopted where required, and were the land drained and rendered fit for bearing crops, and subsoiled, and thoroughly cleaned and manured; were those useless hedgerows, ditches, and trees, that take up so much ground, and damage so much more, swept away, we should find no redundancy of labour in the market; there would be no anxiety about the unemployed—no talk of exporting the strength and sinew of the country, and no fear, as at present, of annually importing a large quantity of foreign grain.—*A Strathearn Farmer.*

Home Correspondence.

Knap-weed.—Our pastures are nearly covered with a coarse Grass, which they call here knot-weed, and it is this year making its appearance even where they were mown for Hay. Neither cows nor horses eat it. Is it of any use in protecting the more tender Grasses? or is it so injurious, by taking up the room and nourishment of better sorts, as to make it worth while to have it pulled up by hand? Now the ground is wet some of the stalks pull out with a portion of the root; but as many break off it will require pulling several seasons before it can be eradicated. It seems to grow most where the ground has been drained. Would it not pay generally to pull out all the coarse weeds from permanent pasture land?—*J. B.* [Persevere in pulling it up, or cutting it off with the spade; no weed can continue long in the ground if treated thus.]

Protection to Bark of Trees.—Twisted Hay or straw-bands bound round the stems of fruit-trees, and slightly coated with gas-tar, will prevent sheep or cattle injuring them. Painting the bark with any kind of mixture may close up the pores of the outer skin, and thus retard the growth of the tree. By the above plan, the air has free access to the boll.—*Falcon.*

Sowing Corn.—The simplest way of sowing Corn over lea land, is to do it broadcast over the first furrow. The seed in this case will fall between the lips of the furrow, and all the advantages of drilling will be obtained, along with the cheapness and speed of sowing broadcast. It is evident that in this case there will be an advantage in having much earth raised in the form of ribs, between which the seed will lie, as then the seed will be sure to be covered. The greater the quantity of earth thus raised, the more efficient will the covering be when the harrows drag it down; and this appears to be the proper office of the harrow. In some districts heavy drags are used to stir the furrow to the bottom; now this is not the office of the harrow, but that of the cultivator, scarifier, or whatever it may be called, which will do it more effectually, and with less difficulty. The office of the harrow is to drag weeds to the surface, and to reduce clods or any unevenness of surface; and, to enable it to do this effectually, its teeth should not be long, but rather so short that the framework of the implement may rub over the ground.—*M.S.*

On Raftering or Ribbing Land.—Each sod or furrow-slice is, in this operation, turned over upon its own breadth of fast land which has not been ploughed. The exposed surface of ground ploughed in this way is greater than that of ground ploughed in ordinary fashion. There are two opinions on the value of this mode of ploughing—opinions, too, which are held to stoutly by their respective owners. The one party holds forth the advantage of the plan especially in ploughing before winter, by which a great surface is exposed to the frost; and the other holds forth the evil of only half ploughing the land. It is evident that in raftering, only every alternate sod is moved, the other being firm land, on the top of which the sods are laid; and this does not so effectually cover the land as to hinder the growth of weeds. Having been accustomed to see land ploughed deeply and effectually before winter, and having no experience of the advantage of raftering land, I cannot give an opinion of its merits. It appears to me, however, that the weather which cannot penetrate fast land as it can that which is loose, cannot have the effect on the half ploughed or raftered field that it can on the field which is perfectly ploughed.—*M.S.*

On Reaping Grain.—The observations and testimonials in the *Gazette*, on the proper period of reaping Wheat at an earlier stage than is now commonly practised, are only confirmatory of an opinion that has long prevailed, and been partially practised, but not generally been adopted on account of the slow rate of progress in agricultural improvements, and the extreme backwardness with which anything new is received. I remember being told by an old practitioner a quarter of a century ago, that Oats should be cut when "paddy-hued," or when the pickles are striped like the back of a paddock, and I have in many cases cut Oats in that state. I have got the straw more juicy, and better in quality, and the farina finer. In the case of Barley being cut in that striped state, I found it always preferred by the maltsters, the skin being thinner, and the sprout quicker and more vigorous. With these two grains the results were quite decisive. In the case of Wheat, I had a field in Leicestershire cut fully ten days before the usual time, the straw being greenish, and the pickle hard, beyond shrinking, not admitting the striped test, as neither the calyx nor corolla adheres. It was threshed in due time, and sold to a miller of much experience, who remarked the very superior quality of the flour in point of fineness and gift, and could give no reason till he asked me if it grew on the field cut so early, and which in public opinion was so much hurt thereby. He saw the cause at once, but the fact convinced none else. He even declared it the finest article he ever saw. It may be very reasonably supposed that fruits and seeds have passed the adolescent state when the quantity of matter is fully gathered which forms the body; and when this has happened, the matter is in its finest form, and a coarseness takes place immediately on verging into confirmed maturity. The processes of nature universally confirm this observation, and in the case of cutting grain, it only remains to judge at what time the matters composing the pickle have acquired a consistency sufficient to prevent shrinking after the crop is cut. It will be found that this period has arrived some time before the straw and ears have attained the common marks of ripeness—a yellow, gold, or white colour; when they are thus fully ripe, the pickles are pushed much more forward in maturity than the appendages of support. My experience enables me to say, that in most cases our grains are 10 to 14 days too late in being cut; and I am glad to be able to add my testimony to the authorities already adduced.—*D.*

Cone Wheat.—Having recently noticed some very fine Cone Wheat growing near this city, I have had the curiosity to ascertain the length and weight of two ears taken indiscriminately, after removal of the crop from the land, and consequently in a dry state.

Length of ear.	Number of seeds.	Weight (Apothecary's).
6 inches	106	150 grs. or 2½ drs.
5½ inches	110	166 grs.

In both cases the stalk measured about 5 feet 6 inches.—*F. S., Gloucester.* [Very fine ears.]

Vale of Evesham.—The harvest in this rich and beautiful vale commenced in good earnest about the first week in August. Although the weather was at first fair and promising, on the second week the barometer fell very low and the farmers' spirits more so; however, a brisk wind and bright sun cleared away the storms, and many a thousand load of Wheat was secured in excellent condition. Various were the implements used for cutting down the Wheat: in some fields might be seen the celebrated Welsh bagging-hook, in others the Scotch scythe, and lastly, though not the least effective, the old English sickle. Many commenced reaping this season earlier than usual: some, tempted by the fine weather, others from the numbers of reapers applying to be set on; those who delayed, thinking the Corn was not sufficiently ripe, had a considerable quantity shed upon the ground. The Wheat was remarkably free from rubbish, and consequently soon ready for carting to the stack-yard. The autumn-planted Wheat will average from three to four bags per acre more than that planted late in the spring. Had it answered as well this season as the three last years, a vast many might have been tempted to deviate from the general rule of planting in the autumn; and then, had such a failure as the present taken place, the consequences to the country might have been very serious. Notwithstanding this deficiency in the spring-planted Wheat, the crop undoubtedly is a full average one; and the grain was never known to be finer. The Barley will be a very indifferent crop. Beans are also very short in the straw, and although in some fields well-podded, the crop is far short of an average. Peas, both White and Grey, were secured in excellent condition, and there is little doubt of their proving good boilers; their colour is excellent, and the straw will prove valuable for store stock. Swedes and Turnips are a failure: although the young plants came up tolerably well, no sooner did they make their appearance than the little spotted fly commenced devouring them, and in a very short time afterwards the aphis joined in the work of destruction. After both these annoying little insects had done their best to annihilate the plants, a white grub began gnawing the roots, and finished the greater portion of those that had escaped. Some tried lime, others soot, but the most effective plan that I have heard of in destroying the aphis was adopted by a neighbour of mine. He sowed lime over the young plants, and afterwards passed a hurdle drawn with willow branches both ways over them—the crop is good. Scarcely one farmer in a parish has a good field of Swedish Turnips; many have sown three or four times, and others have given up in despair. Never was the Swede land more expensively dressed with bones, guano, and all kinds of stimulating manures; notwithstanding which, all have failed. The loss of the Swede crop will be most seriously felt by the large stock owners. The young Clovers amongst the Barley and Wheat present a very poor appearance; few grounds will bear stocking before the spring. Farmers will do wisely to plant as many Vetches as they can—spring keep will be highly valuable. Although reports of the Potato crop are favourable, on a closer inspection they will prove to be incorrect. The early sorts have nearly all rooted again since the rain, and very many of the late Potatoes are full of root without any tubers; only those planted just before the rain in the early part of July are good. The fruit in the Apple and Pear orchards is exceedingly fine and free from blight, and promises to make excellent cider and perry. It is a matter of great thankfulness that the Wheat crop is so good this year. It is now evident that the British farmer can grow sufficient for the increasing population; scarcely a bushel of foreign Corn will be required before another harvest.—*H. H., Jun.*

Are Rabbits Game?—In your *Gazette* of 27th ult. you state "that the tenant of lands, or any person by his direction, may destroy rabbits on such lands without taking out a game certificate;" and you quote Schedule L. of 52 Geo. III. c. 93. Now in two recent Nos. of *Bell's Life* (I think the last published, and the No. 14 days before), an answer to a correspondent gives an opinion quite the reverse. On a point of consequence, it is strange that two such authorities should so differ in their opinions. Would you oblige a subscriber with correct information upon this point?—*No. 5.5.7.* [See Notices to Correspondents in last week's Paper.]

Vetches and Italian Rye-grass.—Mr. Huxtable inquires if Vetches and Italian Rye-grass may be sown together? You remark, "We doubt the propriety of so doing;" you invite information from your correspondents. I now furnish the result of my own experiments. In May, 1842, I sowed a field of four acres with Vetches, Oats, Cow-grass, and Italian Rye-grass; the first crop that season consisted principally of Vetches and Oats, which I took care to cut before the Vetches could destroy the other Grasses. The second crop (that season) consisted of all the Grasses, but now the Italian Rye-grass and Cow-grass prevailed over the Vetches and Oats. We now come to 1843; May 22d I commenced mowing my Italian Rye-grass and Cow-grass, the former prevailing greatly over the latter. The whole field was mowed three times that season, and part of the field four times. Some of the Italian Rye-grass grew to the length of 5 feet 7 inches. Subsoil, gravel and large pebble-stones; previous crop Oats; land very foul, requiring four ploughings; was well limed, and after mowing manured with stable dung, pig's dung, ashes from iron-stone, calcined with anthracite coal, and also the ashes of anthracite coal.—*William Courtes, Ynisceedwyn Iron Works, near Swansea.* [Perhaps you will be kind enough to give us the quantities of the different seeds you sowed per acre. How were they sown?]

House Manure.—Could you not suggest some mode by which the drainage of large mansions might be made use of as manure? In most of our country houses, when not situated near a stream, the drains are, I believe, allowed to lose themselves in the ground at a certain distance from the mansion. Might they not be made of infinite service, by being conducted to a cesspool, into which cesspool, from time to time, might be thrown disinfecting agents, sufficiently powerful to destroy the offensive odour arising from the same? In Belgium these excrements are looked to as the richest manure, but I believe little pains are taken, if any, to overcome its fetid smell, on being drawn forth for the purpose of application to the growing crops—the proprietors of the land being willing to submit to the nuisance for the sake of the value of the article producing it. I have long caused the urine collected from the bed-chambers to be emptied on the dungheap, as well as the water in which soap has been used; but I should like to make more use of the valuable manure created in my house; and as I am about entering a new residence, in which I can make any alterations I like in the drainage, I shall be glad to receive any hints you may be disposed to give, which may throw a light on this subject. It has struck me that, taking into consideration the quantity of water which would run into a cesspool from the water-closets of a modern mansion, a pump placed in the same would afford a rich and valuable supply for flowers or vegetables, or, if a water-cart were used, for irrigating Grass land with a liquid manure.—*A Constant Reader.* [Instead of letting the drains lose themselves in the grounds, let them all deliver into a tank at any convenient spot, causing everything first to pass through a cesspool, in which the solid matters may subside. The contents of this should be mixed with fresh vegetable mould, and

applied as ordinary manure; and the liquid manure should have its ammonia fixed by sulphuric acid or sulphate of iron (see *Gardeners' Chronicle*, No. 33), and may be used in garden or field, as you choose].

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

On the last day of this Society's meeting at Southampton, Dr. Buckland delivered a lecture on Artesian Wells, in the course of which he made the following remarks on the means of improving land which Geology affords:—In his address, last Wednesday, to the Council of the Royal Agricultural Society, he had spoken of the capabilities of permanent agricultural improvement in Hampshire, and other southern counties of England, especially in the districts between the sea-coast and a line drawn from Dorchester through Salisbury and Winchester to London, including Wareham Heath, Poole Heath, the New Forest, and Bagshot Heath. If the improvement of these wastes by the mineral manures that lie beneath their surface were taken up in a scientific manner, and on a large scale, by great proprietors, or by a land improvement company, small portable steam-engines, and portable tram-roads, may be employed to raise from shafts that may be sunk in any part of this district, and transfer to profitable distances, and spread upon the surface the chalk, and clay and marl, that lie at various depths under the area of these sandy wastes. Thus the silt of the Humber has, with very great profit, been lately transferred by tram-roads to be spread on the surface of barren peat. In Norfolk vast tracts of sandy rabbit-warrens have during the last half century been converted to productive Corn-fields, by adding to their surface a top-dressing of marl, clay, chalk, or shelly sand and gravel, locally called *crag*. The cost of such top-dressings of mineral manure need rarely exceed 10*l*. an acre, and the benefit thereof is the conversion of waste into permanently valuable arable land. On Lincoln Heath, where, not 100 years ago, a land lighthouse was erected to guide the benighted traveller across a barren sandy desert, the application of scientific agriculture and capital had converted thousands of acres of unprofitable heath into pleasant and productive Corn fields. The chalk hills also that form the wolds of Lincolnshire, and the wolds of Yorkshire, had been made rich by processes which were now beginning to be introduced in Hampshire. On Thursday last the Prussian minister had called the attention of the assembled agriculturists of England to the example of good farming that is set them by the most illustrious of living warriors, the Duke of Wellington; and near Strathfieldsaye may now be seen rich fields of Barley and Turnips on naturally heavy clay lands, which two or three years ago were reeking with moisture, and incapable of that rotation of green and grain crops which all good farming requires. The Duke of Wellington was year after year improving his clay lands, first by thorough draining, which is the indispensable precursor of all other improvements, and after drainage spreading large quantities of chalk over the surface of the clay. Not less than 1000 waggon loads of chalk had, during the last year, been brought from Basingstoke to the neighbourhood of Strathfieldsaye. Similar improvements of poor sandy soils may be made by laying upon them a good top-dressing of clay and chalk, in addition to ordinary manures; and Geology had ascertained the existence of several kinds of marl and clay at various depths beneath the poor sandy heaths which form so large a portion of South Hants and Dorset and Berks. The place of these clay beds is often indicated by the oozing of water and growth of rushes near the base of the sloping sides of the shallow valleys or combes that traverse these sandy plains, having their base frequently covered with peat. Between Christchurch and Poole many such oozing streamlets point out spots from which, by the aid of a small steam engine and tram-road, clay may be brought up to reclaim the sandy wastes around each of these centres of supply of fertilising mineral manure; and the efficacy of this process had been shown on a small scale near Poole in little inclosures, made by a few industrious peasants. In Hampshire he rejoiced in the occasion of recording a much greater example of improvements of this order now in progress on the property of Sir W. Heathcote, who has already converted to good arable land large inclosed portions of the sandy surface at Anfield and Cranberry Heath, by enriching them with the permanent mineral manures of clay and chalk. Sir W. Heathcote has also adopted on the farm he occupies at Hursley, the practice of stall-feeding oxen, which is essential to produce the great quantities of manure that are required for the fertilisation of all soils that are naturally poor, and without which the improved fertility of the chalk and sandy lands in Lincolnshire could not be sustained. The conversion of barren soils to fertility, is an example of the practical application of geology to the useful purposes of life, and the sciences of agriculture and civil engineering must obviously be imperfect in some of their most fundamental points, without a knowledge of the composition of soils and structure of the earth.—*Hampshire Independent.*

HIGHLAND AND AGRICULTURAL SOCIETY.

At a public breakfast, on the occasion of the late Annual Meeting of this Society in Glasgow, the following interesting conversation took place, on the subject of Failures in the Potato Crop:—Professor Johnston stated that the disease in the Potato was not confined to this country. It was experienced in France, Germany, Holland, Prussia, Russia, and all over the Continent, as well as in North and South America, showing that some elementary principle was required to cure the evil. The universality of the disease only increased the necessity for discovering its cause; and he expected to derive much information on the point from gentlemen connected with England and Ireland, as well as their own country. He took the opportunity to read a communication from Mr. Girdwood, of Bute, of which the following are extracts:—"In 1838, while residing at Bute, I succeeded in raising a good many varieties of the Potato seed; about half a dozen of these promised to be good kinds, and I continued to grow them till I removed to Ayrshire, in 1841, where I carried a sample of them with me; they succeeded well in 1841 and 1842, and I had every reason to expect they were going to turn out valuable field varieties. Last year, however (1843), they were almost a total failure; still the few that did grow were preserved, have been planted this year, and have become healthy and vigorous. Again, on the same field last year (1843), a plot of smooth beds showed symptoms of disease—in fact, there was a good many blanks, and the whole plot was stunted and weakly. I have this year, by way of experiment, planted a portion of the produce of this plot; farther, I intentionally planted them late when the soil was exceedingly dry, and after the sets had lain cut for a week, they have come quite regularly, and look healthy. I shall only further remark, that I have known the plan of keeping those intended for seed in the ground all winter, having tried it for several years past with uniform success."—Mr. Burnet, of Gadgarth, in stating the results of his own experience, said he never planted Potatoes without thoroughly draining and subsoil-ploughing the land. He had experienced no failures in the Potatoes till last year, and that in only one variety, the Rough Reds. This year he had experienced a failure in another variety, the Russian Dons; but this description of failure was very different from that of last year. The general crop is extremely healthy; but here and there, sometimes one and sometimes two have failed. On examining the Potato which had been planted, it was found to be quite fresh, with the skin unbroken, but the plant, which had at first grown up well had withered and died. As to other kinds of Potatoes, he had planted them this year both whole and cut, and there were no failures. He had planted about three acres with guano alone, and without any farm-yard manure, and they had come up invariably vigorous and healthy, except in a very few instances, where the land was not pulverised; and he attributed this, not to the Potato, but to the hardness and roughness of the land, the rest of the field being the most healthy crop he had seen. Another experiment he tried was this:—Last year he planted a variety of Potatoes, and particularly those that were likely to fail, between October and the end of September, at a depth of 12 inches (!) some of them with manure on the top, and some without, and the result was, that those varieties which had failed before failed again. About three-fourths of the crop, however, was good. With regard to the failure that took place in the winter-planted Potatoes, it was somewhat different from that which took place in the spring-planted Potatoes. They began to vegetate in spring, but instead of sending up a sprout, it came only a short way, and formed a tuber on the top.* A less proportion of those planted in spring were good; and he had invariably found that Potatoes left in the ground came up fresh and vigorous without any failure at all.—Mr. Alexander, of Southbar, had grown Potatoes very extensively, and could say from his own experience, that he never had a failure but where the Potato was ill-treated by previous management, by being heated, or otherwise. They were pitted in too large quantities, and these bins all heated more or less. He had never seen a failure in Early Potatoes, which was, in his opinion, accounted for by their never being stowed away in such large quantities; and they were, besides, never so ripe. He found great advantage from putting in Potatoes early, while the land was still moist, and then covering them over with dry gypsum.—Mr. Allison, of Mearns, said, he believed vegetable life was just like animal life, in so far as it would be injured by bad treatment. He had seen whole Potatoes grow frequently where cut ones failed, though if the latter did not fail, they produced better crops than when whole. He also found that the Potatoes were stronger for seed when they were reared from whole Potatoes. If they were raised for two years from whole Potatoes, his experience led him to believe that disease would be cured; they should just allow them to remain in the ground, and never touch them.—Mr. Anderson, who has the management of large estates in the northern parts of Ireland, had watched narrowly the progress of Potato-growing for many years. He had found that where the land was well drained and pulverised, failures seldom occurred. His plan on his own farms was, to drain thoroughly, pulverise the soil, open the drills, and put in the sets, and cover all up in half an hour with the plough; and with this treatment he never had a failure; and when he left them exposed to the sun he found that they always failed. He tried the practice of digging the Potatoes before they were too ripe. The farmers around complained of this, and would not take their seed from him, because they were not ripe; but he had derived great advantage from the practice. He employed careful people, too, to select for seed those Potatoes that had not been injured, and he never planted a Potato that had been injured by the grape or otherwise. In stowing away seed Potatoes he used a long pit, two and a half feet wide at the bottom, and well drained, covering it well up to keep out the air, and never opening it till the seed was to be planted. While cutting the Potato for seed, if it dried into a mealy, starchy substance, then it was considered good, and sown; but if it was watery, then it was rejected. He had sometimes got the farmers to wash the seed in pure fresh water, and then had the ground pulverised all over with lime, &c. He might say that, during many years, he never had a failure in Potatoes, except in one instance, when, during his absence in Scotland, they were allowed to become too ripe, and the land-steward put a large body of them together, when they heated and rooted. In Armagh, through a great part of which he had travelled investigating this subject, he found that where the land was thoroughly drained and subsoil-ploughing attended to, there was no failure.—Mr. Sterling, of Kenmure, gave some interesting details regarding the introduction of the Potato into this country. He said Gerard, an old English botanist, raised seedling Potatoes in 1590; they were planted in the open field in England in 1684; and they were planted in a similar way in Scotland by Thomas Prentice, a day labourer, at Kilsyth, in 1728; they were introduced to Ireland about 1610, by Sir Walter Raleigh. In reference to the taint in Potatoes, he might state that there was no failure 30 years ago, although it was often roughly treated; now disease existed in almost every country where the Potato was cultivated, whether in Europe or America. The oldest varieties, viz., the Rough Red and the Common Red, are most subject to disease; the Cups, one of the newest sorts, blossoms, but seldom bears apples in Scotland; it is one of the most healthy kinds, but within the last two years has begun to fail in Ireland. He believed the disease in this plant was caused by our having allowed it to bear seed annually for so long a period of years—not, as some supposed, by having encouraged it to put forth its productive powers below the surface, but by allowing it to shed its seed to waste on the surface of the soil; he believed that the taint did not arise from fungus, or disease by contact, for his friend Mr. Houston had this year manured a patch of Potatoes with a cart load of decayed ones, and they gave promise of a good crop. The strongest presumptive evidence which he could offer in favour of his views was, that the late varieties, which blossomed freely, are those which are tainted with this disease, whilst the early varieties, which rarely blossom, are free from it. Why then does not the farmer pluck the blossom in his Potato fields, when it has been proved that this practice gives an extra weight of produce? It is because he is not convinced that by allowing the seed to ripen he exhausts not only his soil but his Potato plant, and loses starch from the tubers. He at one time thought that by plucking off the blossoms of our present stock of Potatoes, the disease might be arrested or cured; but he learned last week that some varieties raised from seed a year or two ago were already decaying—thus proving that a "corrupt tree could not bring forth good fruit." Under these circumstances he saw no alternative but to get a fresh supply of seed—and the sooner the better—from Peru, or any other native country of the Potato, where fresh plants have been allowed to come up every successive year. Unless something were done, the Potato might degenerate altogether.—Sir Robert Bateson, from Ireland, begged to state a few facts from his own experience. On one occasion he left Potatoes in the drill during the winter, covering them up a very fine crop. These, from the time they were in the ground, must have been dead ripe. The only drawback to this was, that it prevented the farmer from occupying the ground with other crops; but he thought it would be found advantageous to lay aside a field for this purpose. He planted a field in autumn, which came up without a single miss, and most vigorously, but, strange to say, they continued growing to a later period than those planted in the spring. Perhaps this was caused by their being planted deeper than the spring Potatoes, to protect them from the frost. He learned a fact from Mr. Reid, of Derry, which was worthy of attention. This gentleman raised his Potatoes and spread them in the sun, till they became dried and unfit for food; he then stowed them away, and when planted, never knew a failure. He found that whole Potatoes never failed, but they yielded a smaller crop, and much smaller Potatoes than the cut ones. It was his practice, as soon as a few shaws became ripe, to dig the Potatoes, as he entirely disapproved of ripening too much. Mr. Fleming, of Barrochan, could confirm the fact, that if Potatoes were left in the ground the whole winter through, they never failed; and the later Potatoes were in being planted, and the less ripe they were, the less likely were they to fail. He had always found, that the worst eating Potato, the worst in quality, was the best for seed, and the least likely to prove a failure. Several years ago he had tried to raise Potatoes from seed, under the idea that the plant had become degenerate; but after innumerable trials, and raising many thousands of plants, he had never produced one single healthy variety; therefore, they must look to something else than the mere seed to produce healthy Potatoes, and, in his opinion, the only thing likely to do this was the introduction of some other mode of treatment. What he had found as likely to produce a more healthy Potato for planting was dressing the Potato with nitrate of soda, and sulphate of soda and magnesia. This gave a crop which, when planted, grew more surely than others. His Potatoes, dressed in this way, were all growing well this year, and they had more vitality than when raised by the common farmyard manure.—Mr. Alexander said a person who made a great deal of starch got his Potatoes from a person in his neighbourhood, and it was found that the best Potato for starch was the worst for seed.—Mr. Anderson said,

* The depth at which they were planted was evidently one cause of the failure of the winter-planted Potatoes.

several years ago he tried the experiment of cutting the flowers and apples off every four alternate drills before they came to maturity, and allowed the Potatoes in the other drills to bring forward their seed to maturity. He planted the Potatoes, but never could see the slightest difference between the one and the other; in short, it would not pay the expense.—Mr. Fleming had always observed that Potatoes shallow planted, and where there were a good number exposed to the air, so that they became quite green, made the best seed. A great injury was done to Potatoes by deep planting, as it was absolutely necessary that they should have free access to the atmosphere.—The Chairman said, it would be of great advantage to the meeting if, after the valuable information they had received, Professor Johnston would sum it up before them, and perhaps endeavour to reconcile some contradictory statements which had been made.—Professor Johnston then went over the leading facts brought forward by the previous speakers, and pointed out their value in so far as they suggested to others the propriety of making them the subject of experiment. For example, the plan followed by Mr. Burnet and others of planting Potatoes in autumn, as a surer way of getting a good crop; the course of treatment before planting recommended by Mr. Alexander, viz., to keep them in small bins to prevent heating; the proposal of Mr. Allison to plant whole Potatoes; the suggestions of Mr. Anderson, who recommended well-drained and pulverised land, also opening the drills, putting in the manure and the seed, and covering them up immediately, together with his plan of using green Potatoes for seed; the opinion of Mr. Stirling, that the failures are owing to the seed being grown over a long period of years; and the suggestions of Mr. Fleming and others—all these were matters of great importance, and such as gentlemen should take into consideration, and make the subject of experiment for themselves.—Sir Robert Bateson said he had found a small Potato which grew out of the stem, produced by the juice, which when planted produced excellent crops.—The Chairman then shortly addressed the meeting. They had been engaged in a question of vital importance, and he would appeal to every gentleman present if they had not received much information. He would only express his hope that the meeting that day would be followed by other meetings of a similar character, and he would suggest that sound practical farmers, like Mr. Allison, should be brought forward to such meetings to give the results of such experiments, from which all might derive solid and truly useful information; while men of science, like Professor Johnston, could digest that information, and reconcile what appeared inconsistent; and he had no doubt, notwithstanding the forebodings of Mr. Stirling, that the cultivation of so invaluable an article of food as the Potato would be greatly improved and extended. The meeting then separated.

AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.

The following remarks on the great Annual Meeting of this Society, at Dublin, on Aug. 14th and 15th, are extracted from the *Dublin Farmers' Gazette*:—Amongst the live stock exhibited were very many which, in the opinion of the Judges, would not only have been creditable, but which could hardly be excelled at either of the national Shows of England or Scotland, especially amongst the Bulls; but in all the other classes, together with some splendid animals, the great majority were very inferior; neither in any other of the Cattle Classes did the stock come forward in the usual proportion to the entries; and the vacant stalls thereby occasioned gave a scattered appearance, which bore the semblance of an attempt to spread a few cattle over an immense extent of ground. Much of this deficiency was doubtless caused by the unfortunate prevalence of the distemper; but much more, we fear, by the classification which the Society, departing from the track that has led to such happy results in other Societies, has struck out for itself. The novel distinctions of "Pure and Distinct Breeds of Cattle for Breeding Purposes," and of "Pure and Distinct Breeds for Fattening Purposes," were not understood by our breeders. Up to this time, the effort has been to produce animals possessing both qualities in the highest degree of perfection; and being now, for the first time, called on to produce pure and distinct breeds for each purpose, and left in ignorance as to the meaning of the terms of competition, no wonder they should refuse to send forward their animals, or having sent them, find that they might better have kept them at home. The competition in sheep was by no means so extensive, nor were the lots individually, with some exceptions, equal to our expectations. The Horse Class contained a few fine animals, and may be characterised as respectable; and, as regards swine, we have seen a greater number, and, with few exceptions, superior animals at many of the provincial Shows. We have now arrived at a department of the Exhibition which was really excellent—that of the Agricultural Implements. In mechanical invention, evident efficiency and workmanship, nothing which we have ever before seen could be compared to the implements offered for competition by the Scottish manufacturers, Wilkie, Law, and Grey. As a general collection, that exhibited by the Messrs. Drummond was most creditable, containing, as it did, a full assortment of the most valuable implements; nor were the large contributions of Messrs. Sheridan, Courtney, and Stephens, Lestrange and Bambrick, and Murphy, and Messrs. Paul and Vincent, much inferior, either in execution or apparent efficiency. Mr. Robinson's, of Lisburn, churning and steaming apparatus were most deservedly admired.

The following is the award of Prizes for the Implements exhibited:—

For the best general assortment of collected Implements, to Messrs. Drummond and Co., Dublin, 5*l*.

For the best general assortment of Implements of Irish manufacture, to Messrs. H. and J. Sheridan, Dublin, 4*l*.

For the best Swing Plough exhibited, to Messrs. Drummond, of Stirling, for Barrowman's Plough, the Society's Medal.

For the best Swing Plough manufactured in Ireland, to Messrs. Sheridan, Bridgefoot street, Dublin, the Society's Medal.

For the best Subsoil Plough exhibited, to Mr. Wilkie, Glasgow, the Medal.

For the best Subsoil Plough manufactured in Ireland, to Messrs. H. and J. Sheridan, Dublin, the Medal.

For the best Turnwrist Plough, to Mr. Wilkie, Glasgow, the Medal.

For the best Turnwrist Plough manufactured in Ireland, to Messrs. H. and J. Sheridan, Dublin, the Medal.

For the best Grubber, to Mr. Wilkie, of Glasgow, for his Finlayson's Grubber, the Medal.

For the best Horse Hoe, to Mr. Wilkie, of Glasgow, the Medal.

For the best Turnip Drill, to Messrs. Drummond and Co., Dublin, the Medal.

For the best Turnip and Bone-dust Dropping Machine, to Messrs. Drummond and Co., the Medal.

For a Machine for sowing Carrots, to Messrs. Drummond and Co., the Medal.

For the best Corn and general Drill Machine, to Patrick Gogarty, of Castlebellingham, 2*l*., and the Medal.

To Joshua Anderson, of Dublin, for a model of an improved method of Slating, 2*l*.

To Mr. Bigg, Crawford-st., London, for his Sheep-dipping Apparatus, the Medal.

To Messrs. Courtney and Stephens, Dublin, for their improved Hay-tedder, the Medal.

To the same, for their Water Barrel, the Medal.

To the same, for a Clod Crusher and Bar Roller, 2*l*.

To Mr. F. W. Etheredge, for his patent Tile-making Machine, 5*l*. and the Medal.

To the Hon. C. J. Trench, for his Model of a Cottage with Offices, the Medal.

To John Gwynne, of Bushmills, county Antrim, for a collection of Draining Tools of native manufacture, 2*l*. and the Medal.

To W. Langford, of Newtownbarry, for his Self-adjusting Tumbling Carts, 2*l*. and the Medal.

To Robert Law, of Shettleston, Glasgow, for his Farm Cart, the Medal.

To the same, for his collection of strong and useful Implements, 3*l*.

To John Martin, Peter-st., Dublin, for Rodway's Horseshoe, the Medal.

To John Molloy, Rutland-square, for his newly-invented Hames, trace fastening to swing bar, the Medal.

To Messrs. Paul and Vincent, Blackhall-place, Dublin, for their Threshing Machines, the Medal.

To same, for their simple Beam and Scales, 2*l*.

To James Richmond, of Salford, for his Improved Chaff Cutter, the Medal.

To the same, for his Beam and Oat Crusher, the Medal.

To the same, for his Improved Churn with right and left-hand motion, the Medal.

To the same, for General Excellence of Workmanship, 3*l*.

To Messrs. H. and J. Sheridan, Dublin, for their Improved Weighing Machine, the Medal.

To Mr. James Willis, Dublin, for Herbert's Patent Flower Mill, 1*l*. and the Medal.

To Mr. James Wilkie, Glasgow, for the superior workmanship of his collection of Implements, 5*l*.

To D. J. Wilson, Esq., Belvoir, for his Model of a Labourer's Cottage, the Medal.

To Richard Robinson, of Lisburn, for his Steaming Apparatus, the Medal.

To the same, for his Water-case Churn, the Medal.

To the same, for his General Scientific Arrangement, 3*l*.

To R. Gray, of Uddingston, for a collection of good and well-executed Implements, 3*l*.

To F. M'Neill and Co., for their Roofing Felt, the Medal.

To T. G. Stoney, Esq., for his Model of an Agricultural School, the Medal.

FARMERS' CLUBS.

Wetherby.—The first quarterly meeting of this Society was held on the 1st inst. The attendance of members was numerous, and after an interesting and highly-instructive discussion upon the subject proposed, viz., The best Method of Harvesting Wheat and Barley, including the Period and Method of Cutting and Securing, the following resolutions were agreed upon:—1st, That the best time to cut Wheat is when the grain is in a raw state, and the Straw beginning to assume a yellow hue up to the ear, or from ten to seven days earlier than is customary in this district. 2d, That the best time for cutting Barley is when the Straw and grain are fully ripe. 3d, That the best method of cutting both Wheat and Barley is by mowing; and where Clover or Grass seeds are growing, it is desirable to leave the stubble not shorter than four inches. 4th, That round stacks are better than long ones.

Miscellaneous.

Improvement of Cold and Heavy Soils by Burnt Clay.—The first field, (5 acres.) is valued at 7*s*. 6*d*. per acre. I entered upon it 1839, a foul Bean-stubble; the following May it was skim-ploughed to the depth of about 1½ inch, and all that the plough raised burned with faggots, at the cost, including spreading, of 42*s*. per acre. It was then ploughed and scuffled, and the weather being favourable, was rendered perfectly clean; then planted in October with Vetches, which, the following summer, were eaten off by sheep folded upon them; succeeded by Wheat (1842), which produced 226 bushels, of 62 lbs.; or 1 bushel more than 45 bushels per acre. It was sold at 7*s*. per bushel; and this crop therefore produced more than the fee-simple of the land in its former state. This field is laid down, and is looking very well. A small field of three acres adjoining was similarly treated at the same time, with nearly equal results; the difference in the Wheat-crop, which was not quite so heavy, being attributable to the Vetches having been eaten off by horses tethered on them instead of by sheep. The second instance of the power of ashes, unaided, in rendering exhausted land capable of producing a crop, is, I think, even more conclusive than the first, as it may be said that the great crop of Wheat produced in the former case was attributable to the manure left by the sheep in consuming the Vetches; and this is correct in a degree, but I know not how that crop of Vetches could have been obtained to create that manure without the ashes. In this case, however, the land received no such assistance. It is a field called the Brake Ground—10 acres of exceedingly stiff clay, valued at 25*s*. per acre; and was (Michaelmas, 1839) an awfully foul piece of two years old—I was going to say, seeds—however, it had been down two years; and, for want of something more fit, I was induced to plough and plant it with Wheat—and a miserable speculation it proved. The seed-time of that year, as most of us in this part of the country very well remember, was exceedingly wet. This, combined with the bad state of the land, left me no resource but to dibble it; this was done as well as it could be, and after being twice hoed the following spring, the crop was as nearly as possible 16 bushels per acre. Here then was a stubble in the best possible state for burning, and the weather being dry after harvest, it was skim-ploughed, and attempted to be dragged, but that was impracticable—it was so tied together that it could only be parted with forks, which increased the expense of burning this piece to 50*s*. per acre; but it was well repaid: the quantity of ashes burnt could not have been less, upon by far the greater part of the field, than from 150 to 200 yards per acre. It was then planted, after being ploughed, with Vetches; but such a crop of Crowfoot, Charlock, and rubbish of all descriptions came up the following spring, that I had all mown off together, and carried to the fold-yard. I then proceeded to fallow it, but, as if this field was to be unfortunate, the latter part of the summer proved wet, and it was very imperfectly done, and after draining, was left till April, 1842. The whole of that month proved dry; the field was forked, at an expense of 25*s*. per acre, and by that means rendered clean at last. No rain fell till the night of the 11th of May, and on the 12th and 13th it was drilled with Barley, the produce of which, fit for and sold to the maltster, was 56 bushels per acre. The next crop was Beans, mixed with a few Grey Peas, and certainly the greatest crop of straw I had ever seen. What the produce may be I cannot yet say, but I shall be enabled to inform you, as it is stacked by itself; but I should suppose nearly or quite as many bushels as there were of Barley. All these pieces of land to which I have now alluded had the ashes burned and spread upon the field, at the expense, as I have said, of from 40*s*. to 50*s*. per acre; the greater part done with wood cut from the hedges, the value of which I can scarcely state. When that was all exhausted (a good deal having also been used to put upon the tiles in draining) I had recourse to coals, and can state the expense. Three tons of raked slack, which costs here from 9*s*. to 10*s*. per ton (at the pits 3*s*.) will burn in the summer in heaps of about a cart-load each—more than 100 yards to the acre. I have had in some cases much more than this done; and as the labour of burning with coal is rather less than with wood, the whole can be well done at a cost of 3*l*. 10*s*. per acre. But there is another mode of procuring ashes, which, though somewhat more expensive, has its advantages: these are, that it can be done at a time of year when the other mode would be impracticable from wet; and also, that in doing it, the banks, borders, and high headlands, frequently seen in old inclosures, are removed; it is by burning these in large fires of 50 to 200 yards with coal, and carting and wheeling the ashes upon the land. I have done a good deal in this way; and the cost, not including horse labour—which, of course, varies with the distance to which the ashes have to be drawn—is as follows:—

	£	s.	d.
100 yards per acre, labour to burning, at 6*d*.	2	10	0
2 tons of coal, at 9*s*.	0	18	0
Wheeling and spreading a distance of 50 yards from the heaps, and filling and spreading the remainder, 100 yards, at 1½*d*.	0	12	6
	£4	0	6

I give you the following as an instance of the effect of this latter mode:—A field of clay-land, called Bitton—20 acres, worth 28*s*. per acre—was Wheat in 1842. During the following autumn and winter I had the banks and headlands all round the ground burned, which produced 2400 yards of ashes, 400 of which were drawn to another field. Part of the piece, about 5 acres, was planted with Vetches, which were mown while green for fodder for the sheep, to eat while consuming the Turnips upon the other 15. Upon these 5 acres a dressing of ashes, 100 yards to the acre, were spread when the Vetches were removed; and after being cleaned by the requisite ploughings and scuffling, it is now planted with Wheat. The crop upon this portion of the field must therefore depend entirely upon the ashes: it has derived no benefit from the Vetches. Upon the 15 acres, which were dressed in like manner during the winter, where no attempt was ever before made to grow Turnips in consequence of the tenacious quality of the land, and without the aid of manure of any description, except the ashes, I have had a very excellent crop; and the most extraordinary part of the matter is, that though the greater part has been eaten off in the months of October and November last, which were very wet, by nearly 400 sheep constantly kept upon them, the nature of the soil has been for a time so changed by the ashes, that I have been enabled to plough close behind the sheep, and drilled the Wheat as fast as ploughed. For those who, like myself, have undertaken the task of getting a considerable tract of foul and poor clay-land into a tolerable state of cultivation, there are, to my knowledge, no means by which it can be accomplished in so short a time, and with so great a certainty, as by burning. Let it be accompanied in all cases by draining; let the first crop be a green one consumed upon the land, and the land will be at once established, and may ever after, at the least possible expense, be maintained in a productive state, provided it be kept clean and cropped in a fair and reasonable manner. —*C. Randell, in the English Agric. Soc.'s Journal.*

Bone-dust on Pasture Land.—There is, perhaps, no county in England where the pasture lands (particularly the poorer soils) have been so much improved during the last ten or twelve years as in Cheshire; and this principally by the application of what is termed bone-dust. This extraordinary manure has a peculiar effect upon the poor clay land pastures, for on the application of boiled bones a sudden change takes place in the appearance of the fields, and instead of the carnation-leaved, or pink Grass, which so much abounds on this kind of land, a luxuriant herbage presents itself, consisting of red and white Clover, Trefoil, and other Grasses, of which the cattle are so fond that they eat up almost everything before them; even Thistles and Rushes are very much weakened, and eventually reduced, by being constantly eaten off by the stock after the pastures have been bone-dusted.—*Mr. Palin on Cheshire-farming, in the English Agricultural Society's Journal.*

Growth of Beans and Cabbages together.—The Beans are dibbled in February in double lines four inches apart, and with an interval of three feet to the next row. This enables the double mould-board or the subsoil-plough to pass freely along without injury to the Beans, as often as the state of the soil may require it, until the time of planting the Cabbages. The latter are of the thousand-headed sort, and should have been raised the previous autumn, then pricked out in March (in a corner of the garden), and finally planted in their places between the rows in the field in May or June, taking advantage of showery weather for the purpose. The distance from plant to plant is about two feet; they should be from five to eight inches out of the ground. They do not grow much until after the Beans have been removed, which is generally done early in August. When the latter are gone, the space they occupied is ploughed, and the Cabbages grow with such rapidity as effectually to prevent any weeds from making head that season. No one, ignorant of the practice, sporting over the field in the beginning of September, would imagine that the then luxuriant crop was the second of the season. The Cabbages yield a great bulk of green food towards Christmas, and if their leaves are then pulled, a second sprouting takes place at the end of March or the beginning of April; but as food is of much more consequence to a breeding flock at the latter period, they have been left (without plucking from them in December) till the Turnips are over. They are then eaten on the ground by couples, and the land is ready with a single ploughing for any sort of spring Corn. The quantity of keep derived from them by this arrangement is equal to what the same extent of Turnips would give, but inferior to Swedes. I was led to try the experiment for the first time in 1838, from having accidentally read an account of the husbandry of M. de Fellenbergh, at Hofwyl, in Switzerland, in which a similar custom is mentioned. The success has been complete, and it has never been omitted for a single year since its introduction at Ockham; and I see that, so far from the Bean crop being diminished (in consequence of the greater distance at which the rows are planted to admit the Cabbages between them), it has, on the contrary, been increased from about 35 bushels, the average yield for five years before the mixture, to 41 bushels, the average yield for five years, since the Cabbages were introduced.—*Earl of Lovelace in the English Agricultural Society's Journal.*

Cottage Allotments.—About three years ago I selected two pieces of land, together about 30 statute acres, from a farm of Lord Crewe's, which land had been very hard tilled, and, lying more than a mile from the homestead, had not for many years received any support in the way of manure—besides which it was naturally a weak light soil, with a bad subsoil; and so little did the tenant prize it, that he said I was quite welcome to take it from the farm if I would release him from the rates and taxes paid in respect of it, and make any deduction from his rent I might think proper: this I did to his satisfaction, and set it out in proper allotments, averaging about half an acre each. I allowed the poor men draining-shells, which they put down themselves under my directions, and charged them as much rent as was just sufficient to cover the rent formely paid by the farmer, together with all levies, tithe, rent-charge, &c.; and although the land has only undergone this superior method of cultivation for three years, and was in the lowest condition to commence with, and consequently will improve for years to come, yet notwithstanding these disadvantages the crops grown upon these 30 acres of poor land last summer were as follows:—1497 measures of Potatoes, 298 measures of Wheat, 22 measures of Barley, 10 measures of Vetches, and 70 measures of Oats; which crops, after paying the rent, poor-rates, tithe, and all other charges, amount to nearly 250*l.*, even calculating them at the present low prices of agricultural produce. It is, therefore, impossible that this amount of produce could be distributed amongst these poor men without adding greatly to the comfort of themselves and their families; besides which all these necessaries of life were procured by the application of those leisure hours which would, most likely, have been spent in the beer-house, and might have produced the bitter pains of domestic strife and wretchedness, instead of making the cottage a peaceful and happy home, and the allotment a healthy training-school for the children. I am extensively concerned in the management of cottage property, and necessarily come in contact with some hundreds of cottage tenants (and, I hope, I pay some attention to their habits, wants, and feelings), and I am decidedly of opinion that no able-bodied labourer ought to have less than half an acre of land, which will enable him to raise Potatoes sufficient for his own consumption and to fatten a couple of pigs, besides growing a little bread-corn; and I think it would be for the general good of the agricultural community if every cottager with a family was enabled to keep his cow.—*Mr. Palin on Cheshire-farming, in the English Agricultural Society's Journal.*

Utility of Peat-Ashes.—Peat-ashes cannot be said to have been totally overlooked or disregarded throughout England, though they are so very much in Scotland and Wales; and, indeed, they are only very partially used in England, where their manufacture is almost exclusively confined to Berkshire and Hampshire, and some few spots of Bedfordshire, but from whence they are carried by land for upwards of thirty miles, and sold at about 9*d.* per bushel. Indeed, so strong and powerful is the peat-ash that is burned in immense heaps at Woolhampton, near Newbury, that ten bushels per acre are sufficient to apply, but the usual average elsewhere runs about thirty bushels per acre. Considerable doubts have been expressed as to the quantity of peat-ashes to be used per acre on an average; but this cannot be exactly defined, as so very much must always depend upon two several points—first, the preparation of the ashes, and their sorts; and, second, the various soils, and their various natures, on which the ashes are to be used. One general rule as to the method of preparing the ashes may suffice, as the best and most approved one, which is to have the peats cast in their proper season, and properly dried, and to be burnt in a kiln, properly covered in at the top, with a quick draught. This is the method of treating the "best cast peats," but the top, outsides, and the sedgy and even foggy peats, may be burned in conical piles, and may still be brought into useful application, by making a freer use of them, as this mode of burning this class of peats will cost but very little, and the outside cover has only to be pared away to get at the under and best ashes. But taking the average run of peats, neither the best nor the worst, the quantity per acre may fairly be stated, as an average, at from twenty to thirty bushels per acre, and for old upland meadow, or any old green-sward, this quantity will produce as much or more Dutch Honeysuckle and small herbage as either soot or ashes from sea-borne coal, at one-sixth of the cost, and, when mixed with lime or fine sand, will not only be a very superior top-dressing for all upland and other meadow, and Red Clover without Rye-grass, but will also prove a most valuable compost and manure for Carrots, Parsnips, or Mangold Wurzel, when used in stiff ground, with a strong and large dibbling stick, as is used in Leicestershire or Warwickshire, in all heavy grounds,* and for Potatoes in common drills. The value of the peat-ashes in Warwickshire and Leicestershire is from 9*d.* to 1*s.* per bushel, and as climate, or too great a similarity of soil may be brought forward as an objection, the writer begs leave to say he has tried these ashes in the bleakest and least protected part of Aberdeenshire, with greater success than he ever did in Hertfordshire, Warwickshire, or Leicestershire, and he feels confident that these peat-ashes need only be generally tried to be as generally esteemed and used all over Scotland.—*The Earl of Strathmore, in the Transactions of the Highland Society.*

Notices to Correspondents.

Alpaca.—*Vivarium.*—It is the name of that variety of Llama which yields wool. The other variety, which is nearly naked, is used in Peru as a beast of burden. See article "Llama," Penny Cyclopædia.

Application of Galvanism.—*Anon.*—Perhaps the following extract from a New York paper may assist you. We do not know, though it came from America, whether or not it be, what it looks like, an Americanism:—"At a late meeting of the Farmers' Club in New York, Mr. Ross presented a Potato 7 inches in circumference, and others no larger than Peas, all planted in the same soil, at the same time—the 25th of May. The large one was from a small plot under the influence of a galvanic battery. Plates of copper and zinc were placed at distances of about 200 feet apart, the Potatoes planted between. They were connected by a copper wire. This formed a battery, the moisture of the earth exciting the galvanic fluid, which was thus constantly passing through the soil in which the Potatoes were planted."

Boast's Patent Manures.—*P.*—We have no experience of them. Purchase guano in a safe quarter, and you *know* you buy a useful fertiliser.

Books.—*T. Wighton.*—Low's "Elements of Practical Agriculture."

Cultivation.—*Humbug.*—Use a scarifier or grubber, and work the land lengthwise and across; harrow, gather weeds together, and burn; then you may plough, and use the scarifier again across the furrows; harrow as before and burn the weeds; that will clean your land. Cart on 30 cubic yards of farm-yard manure per acre, and sow Wheat; or, which would be better, plough the land up in ridges, let it lie all winter, cultivate and manure well in spring, and drill in Turnips, which you may eat on the land with sheep, and sow Wheat in November of next year. Good 1st-years' Clover, and Rye-grass may keep 8 to 14 sheep per acre (according to its quality and the size of the sheep), in improving condition for six months in summer.

Depth of Roots.—*J. R.*—We have traced the radicle of the young Wheat plant to a depth of 1 foot when the leaf was not three weeks old. How deep the root of the perfect plant extends we do not know. Perhaps some of our readers have ascertained this; if so, we should be glad to hear from them.

Grass Land.—*Inquirer.*—A farmer would require to see the Grass land which it is proposed to break up, before he could judge whether or not he would profit by permission to cultivate it. If he should prefer it as arable land, he would, of course, be willing to pay a higher rent for it in that condition; if occupying a stiff and wet soil, he would not break up his pasture, though permitted. We do not know if there be a particular species of Oat adapted for winter-sowing. Wheat will diminish in bulk before summer, after threshing in winter, in the proportion in which it may have become drier; how much it may generally diminish from that cause we do not know. Can any one give information as to Daniell's manure having proved useful as a manure for Wheat?

Gypsum.—*H. D.*—We cannot imagine that the small quantity of iron mixed with your gypsum can render it at all injurious to vegetation.

Insects.—*J. N. V.'s* grubs are the caterpillars of a moth called Noctua exclamationis, whose history was given in the Royal Agr. Jour., vol. iv. p. 106, together with figures of the insects. We can recommend no better mode of freeing crops of this pest than hand-picking. Its effects have been lately shown with regard to the wireworm in a calculation published in the last Number of the same Journal. *R.*——*W. L. W.*—Your grubs are the same as the above, and we beg to call your attention to their history in the work just alluded to, where the various modes of extirpation are discussed. We feel much obliged by your remarks regarding the wireworm, and would recommend you to try the effect of gas-water upon them in a cup, and ascertain the length of time they can resist its effects. If it be satisfactory, you can prosecute your experiments in the field. The curious snake-like animal changes to a fly called Thereva. *R.*——*A Cotswold Farmer.*—Your Turnips are infested with plant-lice, or aphides; and the animals transmitted are the larvæ of the lady-birds, whose history you will find in this day's *Chronicle*. They are amongst the best friends you have. *R.*

Parsnip.—*J. B. F.*—We do not know the Giant-Cow-Parsnip. It is, doubtless, propagated by seed. We cannot recommend seedsmen.

Sulphate of Magnesia.—*A. L. M.*—The mode in which alum is manufactured, both on the Continent and in Yorkshire, is to roast clays containing sulphuret of iron and potash. The sulphur is converted by heat and subsequent exposure to the air, into sulphuric acid, which combines with the alumina; this is dissolved out, and as it rarely occurs that the clay contains sufficient potash to form alum, (which is a sulphate of alumina and potash), a solution of potash is added to the ley obtained from the roasted clay; it is then boiled, after which the iron is allowed to deposit; and lime as sulphate of lime, if lime exist in the clay, when it is evaporated and crystallised. If magnesia existed in the clay the sulphate of magnesia would be found in the mother water, for water of crystallised sulphate of magnesia and carbonate of ammonia do *not* mutually decompose each other, therefore it is incapable of fixing the ammonia in liquid manure. But ammonia in its caustic state *will* decompose a solution of sulphate of magnesia, precipitating the magnesia as a bulky hydrate of magnesia. Dr. Turner says "The bicarbonates and the common carbonate of ammonia do not precipitate magnesia."—*A. G.*

Water for Cattle.—*Improver.*—Soft water is decidedly more wholesome for both horses and cows than hard water, the latter owing its hardness chiefly to the presence of sulphate of lime (gypsum), or carbonate of lime (chalk), neither of which is desirable as an addition to the element as it comes from the clouds, but renders it more apt to cause spasm of the bowels (cholic). Rain-water is certainly the purest that can be obtained, and only requires care that it does not contain the impurities from the roof of the building, and that it does not remain unused long enough to putrefy. *W. C. S.*

Wheat.—*Improver.*—If you will send your address we shall be happy to forward some for experiment.

Winter Vetches.—*A Subscriber* may begin to sow immediately for his earliest crop if his land be late. The middle or end of next month will be sufficiently early on early soils. We do not know the Emperor Cabbage.

Wood-ashes.—*T. W.*—Fresh ashes contain caustic alkali, which, whatever be the form of the ammonia with which it may come in contact, will take from it, by virtue of its greater affinity, the acid which holds it fixed, and thus let it free. If the ashes be old, they will not thus volatilise the ammonia, because the alkali will, by uniting with the carbonic acid of the air, have lost its causticity. The use of guano will not diminish any necessity which may at present exist for the use of lime. If the act of liming increases the produce your land, it will do so just as it would be were you to use guano. Guano must not be the same, whether the fertility of your land be as it is now, or used on land which has been lately limed, for caustic lime would volatilise the ammonia just as caustic ashes do.

*** As usual, many communications have been received too late.

Markets.

SMITHFIELD, Monday, Aug. 26.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3s	10	to 4s	0	Best Downs & Half-breds	3s 10 to 4s 0
Best Short Horns	3	8		3 10	Best Long-wools	3 6	3 10
Second quality Beasts	3	2		3 6	Ewes and second quality	3 4	3 6
Calves	3	8		4 4	Lambs	3 8	4 4
Pigs	3	4		4 4			

Beasts, 3065; Sheep and Lambs, 36,800; Calves, 146; Pigs, 280.

The supply of Beasts to-day is larger, but a considerable quantity of very inferior quality; the increase in numbers has, however, had an effect upon the trade, and we cannot this week quote 4s 2d for the best Scots, &c., although some few make it; the Short-horns of good quality find almost as ready a sale as anything, they being now in season, and several have made very nearly 4s per 8 lbs; trade is very heavy among the middling qualities, and some remain unsold. Sheep are again very abundant, and the trade is excessively heavy, we have a very great many Ewes and middling Sheep, but are not over-supplied with the best qualities, consequently the prices with some difficulty are maintained for good Sheep, but several Ewes, &c., cannot be sold at all. Lamb is almost out of the market. Veal is a dull trade—4s 4d is hardly realised for anything. Pork is tolerably brisk.

Friday, Aug. 30.

The supply of good Beef is still but moderate; the trade for that description continues about the same as on Monday; on the whole, the supply is large, and trade heavy; many middling Beasts cannot be disposed of; what are sold make nearly the same as on Monday. The number of Sheep and Lambs is about the same as of late, and prices are about as on Monday; trade seems somewhat more brisk for the best qualities. Veal-trade is a little more lively, but the prices are no better. Pork remains steady.

Beasts, 884; Sheep and Lambs, 9680; Calves, 361; Pigs, 280.

41, West Smithfield.

WOOL.—British, Friday, Aug. 30.

Our Wool Market is much the same as we last reported it. The prices demanded by the Farmers are higher than the Staplers can afford, and the stock of Wool at present in the Market keeps prices from advancing.

* This method of dibbling Carrots, Parsnips, and Mangold Wurzel, with peat-compost in the heavy lands in Leicestershire and Warwickshire, has uniformly succeeded where every other culture and manure have failed, and is managed thus:—Plough your land in the end of September or beginning of October with a good strong furrow, and in the month of March (about the middle) let your dibblers begin, always dibbling backwards, and making a hole about as wide as a pint bottle, and thirteen inches deep; fill up the hole with the peat-compost to within four inches of the top. Put into each hole eight or ten seeds, cover them over with the peat-compost till level with the ground, then draw a slight but strong "bush harrow" over them. When they have shot, let the three best shoots be left, and the rest weeded out carefully, as they may do to transplant and fill up any vacancies where the seed may have failed. This will be done by women and children better than by men. Let the remaining plants be earthed up, and this will be as good as one hoeing, and, on a second and final looking over the dibble-holes, let all the plants be removed but one, and earth that well up. In the very deep lands in Leicestershire, which will not bear a cart in the spring, donkeys are used with large panniers to carry the compost up and down each furrow, which answers very well, and does not poach the ground like horses and the lightest mounted carts.

COVENT GARDEN, August 31.—The continuance of the late fine weather has caused an abundant supply of Fruit and Vegetables to be brought into the market. Wall fruit, in particular, is very plentiful. Trade is, however, unusually dull for the season of the year. Pine-apples of good quality are sufficient for the demand; and hothouse Grapes are also well supplied. Peaches continue to bring nearly the same prices as last week. Nectarines are a little cheaper. Apricots are scarce. Of Plums there is abundance; some good samples of Coe's Golden Drop have been offered during the week; Orleans and Green Gages are somewhat reduced in price since our last report. Among Apples a few good specimens of Ribston Pippin have made their appearance; and a considerable quantity of Williams's Bon Chretien Pear are in the market. Filberts although not abundant are rather on the increase; they bring from 65s. to 80s per 100lbs. Melons are good and sufficient for the demand. Morello Cherries have not altered in price since our last report. Tomatoes are a little cheaper. Cucumbers are nearly the same as last week. Among Vegetables, French Beans are good and plentiful, Cauliflowers are sufficient for the demand, and Cabbages, Turnips, and Carrots are abundant. Windsor Beans are scarce; Peas are also becoming scarcer, and have advanced a little in price. Little alteration has taken place in the price of Celery, which is rather improving in quality. Onions are plentiful, and Shallots are becoming more abundant. Endive is also supplied in considerable quantities. Cut Flowers chiefly consist of Euphorbia splendens, Ceanothus azureus, Bignonia venusta, yellow and perpetual Roses, China Asters, Lobelias, Heliotropes, Camellias, Sweet Peas, Verbenas, Fuchsias, Pelargoniums, Picotees, and Carnations.

FRUITS.

Pine Apple, per lb., 3s to 5s
Grapes, Hothouse, p. lb., 2s to 4s

Endive, per score, 1s to 1s 6d
Mushrooms, per pottle, 1s to 1s 6d
Small Salads, per punnet, 2d to 3d
Watercress, p. 12 sm. bun. 3d to 6d
Parsley, per doz. bunches, 1s to 3s
Tarragon, Green, per bunch, 2d to 3d
Green Mint, per bunch, 2d to 3d
Marjoram, per bunch 2d to 3d
Chervil, per punnet, 2d to 3d

HOPS, Friday, Aug. 30.

The Market continues very firm. A slight improvement is said to have taken place in the best grounds, which has caused a few persons to back the duty as high as 130,000*l*; the blighted districts, however, make but little, if any progress, and we still think the duty over-rated, unless we get warmer nights. One pocket of the new crop arrived on Wednesday, from Berling, Kent, and was sold at 9*l* 12s per cwt; they were very thin and unripe. If this is a fair specimen of the new crop, it will prove very inferior to last year's growth. Picking ought not in our opinion to commence for a fortnight at least, the Hops being so backward.

Pattenden & Smith, Hop-Factors.

MARK-LANE, Monday, Aug. 26.

The supply of Wheat by land carriage samples this morning was moderate, and consisted almost entirely of New—the condition and quality much worse than last week, a great proportion having been damaged by the weather; fine dry qualities commanded the prices of this day se'nnight, but the damp and inferior must be written 1s. to 2s. cheaper, and some quantity remained unsold at the close. There appeared some inclination to purchase old Foreign Wheat, where it could be done at reduced terms, but as Factors generally evinced great firmness, the business transacted was not extensive.—In Barley and Peas there is no alteration.—Beans are in good request, and bring very full prices.—Oats sell slowly, and barely maintain our quotations.—The supply of new Mustard-seed consisted of about 600 qrs. in nearly equal proportions of White and Brown.

ARRIVALS IN THE RIVER LAST WEEK.

Friday, Aug. 30.

We have had little English Wheat up since Monday, but the reluctance of Millers to purchase renders it impossible to obtain the rates of that day. In Foreign a few sales were made on Wednesday, at rather reduced prices, which, from the small amount of business doing, must be considered nominal. There is a slight inquiry for Wheat in Bond for export to France and Holland.—Barley and Beans continue inquired after, but cannot be noted higher.—Peas are neglected.—Oats meet an improved demand, and needy buyers are obliged to pay a slight advance.

NATIONAL TESTIMONIAL to Mr. ROWLAND HILL, Author of the Penny Postage, under the Management of the City of London Mercantile Committee on Postage.

Sir George Larpent, Bart., Chairman and Treasurer.

The Committee engaged in this undertaking beg to intimate to the several provincial Committees and others, who are co-operating with them, that it is their wish to close the Subscriptions in the month of September.

To those who have not yet contributed, the Committee again appeal for their Subscriptions, in the confident expectation that few would wish the opportunity of rewarding the author of a plan which has conferred such great social, moral, and commercial benefits on the country to pass by without their having taken part in it.

When the Collection is completed, the mode in which the amount raised is to be presented to Mr. Hill will be determined and made known to the public.

Subscriptions may be paid through any of the London Banks, or remitted by post-office orders, stamps, or otherwise, to the Secretary, Mr. George Wansey, Solicitor, No. 3, Lothbury, London.

INTERESTING TO LADIES. — To MESSRS. ROWLAND & SON, 20, Hatton Garden, London.—"Percy Place, Landport, Portsmouth, April 4, 1844. Gentlemen,—I think it but an act of justice to inform you of the benefit I have derived from the use of your admirable Macassar Oil. About six months ago I found my hair getting daily more weak and thin, and much discoloured from a practice I had adopted of wetting it continually; fearing that I should lose it entirely, and hearing of the efficacy of your Macassar Oil, I have for some time past constantly used it, and the result is, that my hair is now perfectly restored and much improved in appearance and colour, having become thick, dark and glossy; it also curls freely without the use of paper, which it never did before. To all my friends I have warmly recommended your Macassar Oil as an excellent restorative and preservative for the Hair. As I have an objection to see my name in print, I beg you will not publish it; but you are at liberty to show this letter, or make any other use you please of it, and refer applicants to me if necessary, in proof of the efficacy of your Macassar Oil. Your Obt. Servant *"

ROWLAND'S MACASSAR OIL preserves and reproduces the Hair; prevents it from falling off or turning Gray; changes Gray Hair to its original colour; frees it from Scurf and Dandriff, and makes it beautifully soft and curly.

**** Ask for "ROWLAND'S MACASSAR OIL." All others are Fraudulent Counterfeits.

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June* 6, 1844.—The cabin of the Great Western has been regularly supplied with Lea & Perrins's Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers for its capital flavour, and as the best accompaniment of its kind for a voyage. (Signed) James Hoskeen."

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup: giving a zest far superior to the long-established favourites; more wholesome and of less cost."—*Naval and Military Gazette*, April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. Lea and Perrins, Worcester; Messrs. Barclay and Son, Farringdon-street; and the principal Oil and Italian Warehousemen in London; and Retail by the usual venders of Sauces.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. & H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

EXTIRPATION of all kinds of VERMIN.—Office, 69, King William-street, city, London.—Mr. J. A. MEYER, practical chymist, patronised by Her Majesty the Queen, H.R.H. the Duchess of Kent, the Royal Agricultural Society of England, and the Corporation of the City of London, and by special appointments to the principal Courts of Europe, begs to inform the nobility, gentry, merchants, agriculturists, shipowners, and the public generally, that he continues to CLEANSE, by contract, from one to five years, every description of PROPERTY, of rats, mice, moles, weasels, moths, fleas, bugs, &c., and as a guarantee of the efficacy of his preparation, respectfully refers to the certificates of his great success at Buckingham Palace and Gardens, Windsor Castle, St. James's Palace, Frogmore Lodge, Carlton Club House, Mansion House, Newgate Prison, Tavistock Hotel, Brewers, Chester, and Galley Quays and warehouses in Lower Thames-street, the property of Joseph Barber, Esq., and many others of public and private establishments, which may be seen at the office. The preparations, which are free of poison or deleterious drugs, may be had as above, in pots and bottles at 5s., 10s., 20s., 50s., and 100s. each, with full directions, which must be used in proportion to the extent of premises infested, to successfully eradicate the vermin, and which can be applied without injury to property. Dwelling-houses cleansed from 1*l*. to 5*l*. per annum; mansions and estates from 10*l*. and upwards; ships, docks, warehouses, granaries, breweries, farms, wharfs, &c., in proportion. Caution.—None are genuine unless bearing the signature and seal "Joseph Anton Meyer."

TERRA COTTA FIGURES, VASES, FOUNTAINS, &c. Manufactured by DOULTON and WATTS, Lambeth Pottery, High-street, Lambeth, London.

D. and W., from their experience as Potters, have made considerable improvements in the manufacture of Terra Cotta, the superiority of which over Artificial Stone or Cement is well known. It is subjected to a high degree of fire, which renders it imperishable, and gives it a sharpness and surface which no changes of temperature can impair.

D. and W. are enabled to offer the Terra Cotta at a considerable reduction in price; and Drawings and Designs will be forwarded Gratis, on application.—Architectural work executed.

DRESS AND FROCK COATS.—Superfine Cloth Dress Coats, 30s. to 35s.; Extra Quality, 40s. to 50s.; Frock Coats, with Silk facing, 35s. to 42s.; with Silk Velvet Collar and Silk facing, 50s.; Waterproof Chesterfield, Codrington, and Travelling Coats, 12s., 15s., and 21s.; Waistcoats, 5s. 6d. to 8s. 6d; rich Satin, Silk and Cassimere, 8s. 6d. to 12s. 6d.; Trowsers, 6s. 6d. to 10s. 6d.; Doeskin and Kerseymere, 12s. 6d. to 21s.; Shooting Jackets, 10s. 6d., Boys' and Youths' Cloth, Hussar Suits, 21s. to 30s. A Suit of Superfine Black Cloth, 3*l*.; Extra Quality, 3*l*. 10s. to 4*l*. At Fisher & Co.'s, Tailors, 31, King William-street, City, ten doors from London-bridge.

PAXTON'S POCKET BOTANICAL DICTIONARY.

In what may be called an age of Cyclopædias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, a Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur and Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of Horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

Price 7*s*., Illustrated with Wood-cuts of Birds, Cages, &c.

NATURAL HISTORY OF CAGE BIRDS; their Management, Habits, Food, Diseases, Treatment, Breeding, and the Methods of Catching them. By J. M. Bechstein, M.D.

"It will be welcome to every gentleman's library or drawing-room table. It is superbly got up, with an immense number of vignettes, and, in fact rivals the beauty of the Annuals."—*Weekly Dispatch*.

"A very delightful book of its kind. . . . . It seems to us an indispensable book for the bird-fancier."—*Spectator*.

London: W. S. Orr and Co.; and W. R. Chambers, Edinburgh.

CANDLES SUPERIOR IN THEIR BURNING QUALITIES TO THE FINEST WAX are now retailed throughout the Country at One Shilling per pound.

Parties who are in the habit of burning two Tallow moulds of four to the pound, are respectfully requested to make the experiment, whether a single "PRICE'S PATENT CANDLE" of six to the pound will not give more light; and whether therefore these candles do not afford a cheaper source of light than the commonest Tallow ones, notwithstanding the difference in price per pound.

Care must be taken to ask for them in the shops under the name given above, as there are some imitations sold under the name "Composite," by which Price's Patent Candles were originally made public.

The Trade may obtain them wholesale from EDWARD PRICE and Co., Belmont, Vauxhall; or from PALMER and Co., Sutton-street, Clerkenwell.

DRAWING-ROOM CLOCKS.—A. B. SAVORY and SONS, No. 9, Cornhill, London, opposite the Bank of England, invite attention to a splendid variety of Rosewood, China, Bronze, and Ormolu CLOCKS; they go for eight days and strike the hours and half-hours. Price 4 guineas, 7 guineas, and 10 guineas each, and upwards. The performance is warranted.

A Pamphlet, with detailed lists of Prices, and illustrated with sketches, may be had on application gratis, or sent to all parts of Great Britain and Ireland, postage free, in answer to a post letter.

BAILY'S SERIES OF WINNERS.—Under the above title, Messrs. A. H. BAILY & Co. have commenced a Series of Portraits of the Derby, Oaks, and Leger Winners, and of other Horses celebrated for their performances. For this purpose they have engaged the talents of Mr. J. F. HERRING, Sen., so well known as the celebrated Horse-painter. The likeness and execution of each is acknowledged to be perfection.

The size of the Portraits is much larger, and as Works of Art they are much superior to anything hitherto published.

No. 1.—BEE'S-WING. 1*l.* 1*s.*

"It is amongst the best, if it be not the very best, of the portraits of race-horses ever painted. It is a perfect representation of the celebrated and wonderful mare, Bee's-wing, perhaps the best that ever ran at Ascot, or indeed, over any other course. Mr. Herring has given a characteristic portrait, full of identity and life; the picture, moreover, is full of pictorial merit as a work of art; the lights are admirably managed, the very horse-cloths, the litter, and the things which are to be seen in racing stables, are all introduced, and made subservient to general effect. The print will be an excellent addition to portfolios and the walls of the rooms of sporting men, and men of taste."—*Times.*

"She is taken in her loose box, with her lively eye turned as it were on the visitor, who may be presumed to have popped in to take a peep at the pride of Northumbria. All the known points of this model of a mare are accurately presented, and her splendid rich bay delineated to perfection; her quarters are accurately portrayed, and she is placed (that great difficulty) naturally, and therefore gracefully, on her legs."—*Era.*

On the first of November will be published,

JOHNSON AND SHAW'S FARMERS' ALMANAC for 1845. Suggestions for its improvement and corrections are earnestly requested. All Advertisements for its advertising sheets must be sent by the first of October, to the Publisher,

J. RIDGWAY, 169, Piccadilly.

Just published, the Thirteenth Edition, price 2*s.* 6*d.*; free by post, 3*s.* 6*d.*,

THE SILENT FRIEND ON NERVOUS DEBILITY, CONSTITUTIONAL WEAKNESS, &c. By R. and L. PERRY and Co., Surgeons, London. Published by the Authors, and sold at their residence; also by Strange, 21, Paternoster-row; Noble, 109, Chancery-lane; Crocker, 1, Milford-lane, Strand; Ward, 103, Strand (opposite Exeter Hall); Gordon, 146, Leadenhall-st.; Purkiss, Compton-st., Soho; Wilson, 338, Oxford-st. (two doors from Argyll-st.), London. The Cordial Balm of Syriacum is a stimulant and renovator in all Spasmodic complaints. Nervous Debility, Indigestion, Asthma, and Consumption, are gradually and imperceptibly removed by its use, and the whole system restored to a healthy state of organisation. Sold in bottles, price 11*s.* and 33*s.* PERRY'S Purifying Specific Pills have long been used as the most certain remedy for Scorbutic Complaints of every description, Eruptions of the Skin, Pimples on the Face, and other disagreeable affections, the result of an impure state of the blood. These Pills are perfectly free from mercury and other deleterious drugs, and may be taken with safety without interference with, or loss of time from business, and can be relied upon in every instance. Sold in boxes, at 2*s.* 9*d.*, 4*s.* 6*d.*, and 11*s.*, by all Medicine Venders.

Messrs. PERRY and Co. may be consulted daily at their residence, 19, Berners-street, Oxford-street, from 11 till 2, and from 5 till 8. On Sunday, from 10 till 12.

THE INJURY AND WASTE OF CORN, FROM THE PRESENT PRACTICE OF TOO THICKLY SOWING. Third Edition, with corrections. By HEWITT DAVIS, London, Author of "The Resources Farmers Possess for Meeting the Reduced Prices of their Produce."

I would have Farmers look to the means which modern Science affords for lessening their expenses and increasing their returns.

London: A. REDFORD, London-road, Southwark; SIMPKIN, MARSHALL, and Co., Stationers' Hall-court; J. RIDGWAY, Piccadilly; and F. WALLER, 49, Fleet-street. Price One Shilling.

HOOD'S MAGAZINE for SEPTEMBER, price 2*s.* 6*d.*, Illustrated with Cuts in the "Comic Annual" style, contains—The continuation of "Our Family," a novel of domestic interest, by the Editor—Also Camberwell Fair towards Midnight—Dallady the Negress—The Husk and the Grain, &c. &c.—An unpublished Sonnet, by the late John Keats—A new Poem, by R. Monckton Milnes, Esq., M.P.—And other Articles, of diversified interest, by T. Hood, F. O. Ward, Andrew Winter, Dr. Shelton Mackenzie, LL.D., Miss Lawrence, &c.

London: HENRY RENSHAW, 356, Strand; and all Booksellers.

Now ready, and sent, free of postage, on application,

A CATALOGUE OF EDUCATIONAL BOOKS for the use of Schools and Families, including the Works published under the sanction of the Committee of Privy Council on Education, and those issued by the Committee of General Literature and Education, appointed by the Society for Promoting Christian Knowledge, and adapted to the use of National and other Schools.

London: JOHN W. PARKER, Publisher, West Strand.

PRINTED FOR

TAYLOR AND WALTON,

BOOKSELLERS AND PUBLISHERS TO UNIVERSITY COLLEGE

UPPER GOWER-STREET.

DARLEY'S

SCIENTIFIC LIBRARY

FOR THE USE OF

SCHOOLS, PRIVATE STUDENTS, ARTISTS, AND MECHANICS.

IT is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics these little works will be particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind and brief for the memory; and the Elements of each Science are reduced not only to their simplest but to their shortest form.

I.

A NEW EDITION (being the fifth) *is now ready,*

A SYSTEM

OF

POPULAR GEOMETRY;

Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading truths and great principles.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*, cloth.

II.

NEW EDITION (just published),

COMPANION

TO THE

POPULAR GEOMETRY;

In which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of life, with numerous Cuts.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*, cloth.

III.

THIRD EDITION,

A SYSTEM

OF

POPULAR ALGEBRA;

WITH

A Section on PROPORTIONS and PROGRESSIONS.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*

"For Students who only seek this limited knowledge of these sciences, there are, perhaps, no treatises which can be read with more advantage than Darley's Popular Geometry and Algebra."—*Library of Useful Knowledge, article "Mechanics."*

IV.

SECOND EDITION,

A SYSTEM

OF

POPULAR TRIGONOMETRY,

Both Plane and Spherical.

With POPULAR TREATISES on LOGARITHMS, and the Application of Algebra to Geometry.

BY GEORGE DARLEY, A.B.

Price 3*s.* 6*d.*, cloth.

V.

FAMILIAR ASTRONOMY.

BY GEORGE DARLEY, A.B.

WITH ENGRAVINGS.—12mo, 5*s.*, cloth lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun.*

VICTORIA LIFE ASSURANCE COMPANY.—*Trustees.*—Sir Jas. Duke, Ald., M.P., Chairman. Benjamin Hawes, Esq., Deputy Chairman. Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.

Advances made to assurers on real or undoubted personal security, for terms of years, re-payable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary.

WILLIAM RATRAY, Actuary and Secretary.

CROWN LIFE ASSURANCE COMPANY, 33, Bridge-street, Blackfriars, London.

Directors.—George H. Hooper, Esq., Chairman; Sir John Kirkland, Deputy-Chairman.

John Chapman, Esq.
Charles Chippindale, Esq.
James Colquhoun, Esq.
B. D. Colvin, Esq.
Rear Adm. Dundas, C.B., M.P.
Thomas Harrison, Esq.
Jameson Hunter, Esq.
Lieut.-Col. Moody, R.E.
John Nelson, Esq.
Richard Norman, Esq.
Alexander Stewart, Esq.
William Whitmore, Esq.
William Wilson, Esq.

Auditors.—J. H. Forbes, Esq.; Geo. Hankey, Esq.; Thomas Lawrence, Esq.

Physicians.—Dr. James Johnston, 8, Suffolk-place, Pall Mall East; Sir C. F. Forbes, M.D., K.C.H., 23, Argyll-street.

Surgeon.—Samuel Solly, Esq., F.R.S., 1, St. Helen's-place.

Standing Counsel.—Charles Ellis, Esq.

Solicitors.—Messrs. Hale, Boys, and Austen.

Bankers.—Bank of England. *Actuary.*—J. M. Rainbow, Esq.

THE ADVANTAGES OF THIS OFFICE, among others, are:

1. A participation septennially in two-thirds of the profits, which may be applied either in reduction of the Premium, or to augment the sum assured. The following Bonuses have been assigned to all Policies, of at least three years' standing, effected for the whole duration of Life:—First Division, in 1832—From 18*s.* to 2*l.* 12*s.* per cent. per annum on the sums assured, varying with the age, being equivalent, on the average, to 26½ per cent. on the Premiums paid. Second Division in 1839—From upwards of 1*l.* to upwards of 3*l.* per cent. per annum on the sums assured, or, on the average, 33 per cent. on the Premiums paid for the preceding seven years.

2. Premiums may be paid in a limited number of annual sums, instead of by annual payments for the whole of life; the Policy continuing to participate in Profits after the payment of such Premiums has ceased.

3. The Assurance or Premium Fund is not subject to any charge for Interest to Proprietors.

4. Permission to pass to Continental Ports between Brest and the Elbe inclusive.

5. Parties (including Officers of the Army, Navy, East India Company, and Merchant Service), may be assured to reside in or proceed to all parts of the world, at Premiums calculated on real data.

6. Claims to be paid within three months.

7. The Assured may dispose of their Policies to the Company.

8. No charge but for Policy Stamps.

The Prospectus, Tables of Rates, &c. to be had at the Office in London, or of the Company's Agents. T. G. CONYERS, Sec.

GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY. 14, WATERLOO PLACE, LONDON.

The Chisholm, *Chairman.* W. Morley, Esq., *Deputy Chairman.*

PECULIAR ADVANTAGES OFFERED TO POLICY-HOLDERS IN THIS INSTITUTION.

An extremely low Rate of Premium, without participation in the Profits, but with the option, at any time within five years, of paying up the difference between the Reduced Rates and the Mutual Assurance Rates; and thus becoming Members of the Society, and entitled to a full participation in the Profits.

Extract from the Reduced Scale of Rates, for an Assurance of 100*l.*, for One Year, Seven Years, and the whole Term of Life.

News of the Week.

THE bombardment and destruction of Mogadore, the great commercial port of the Moorish empire, and the subsequent occupation of the island which commands the harbour by the squadron of the Prince de Joinville, is by far the most important event which has yet occurred in the war between France and Morocco. Unlike the demonstration at Tangiers, this affair is remarkable, not merely for the bombardment of the Moorish batteries, but for the destruction of the town itself, which appears, from the terms employed in the despatch, to have been completely reduced to ruins. The subsequent seizure of the island has given a still more serious aspect to the transaction; and, if report be true, it has already produced an important crisis in the relations between Great Britain and France. It is stated by the *Morning Post* of yesterday, on what it announces to be good authority, that the receipt of the intelligence from Mogadore on Tuesday night was immediately followed by the despatch of a special courier to Paris as the bearer of a communication from Lord Aberdeen to M. Guizot. His Lordship is said to have demanded the immediate evacuation of the island of Mogadore by the forces under the Prince de Joinville, and to have intimated that, in the event of a refusal to withdraw the French troops, measures would forthwith be taken in conformity with the established usage in similar circumstances. This report was contradicted by the *Standard* of last night, and considered questionable by some of the other papers, but at present there are no means of ascertaining its truth. The affair of Tahiti is also said to have reached its crisis. The French papers for some days have argued on the belief that the British Cabinet, after having taken the opinion of the law officers of the Crown, had sent an *ultimatum* to the French Government, demanding the recall of Capt. Bruat and M. D'Aubigny from Tahiti, and had directed Lord Cowley, in the event of a refusal, to demand his passports. It is now however stated by one of the official journals that, notwithstanding the rumours to the contrary, no specific *ultimatum* has yet been presented by our Government, but that a great number of verbal and other communications upon the subject have taken place between Lord Cowley and M. Guizot. Lord Cowley, on the part of the British Government, demands the recall of both Capt. Bruat and M. d'Aubigny, and the disavowal of the conduct of these officers to Mr. Pritchard. M. Guizot, it is said, refuses to disavow Capt. Bruat, on the ground that he was quite entitled to remove Mr. Pritchard from the island; and as regards M. d'Aubigny, he maintains that the unnecessary harshness of his conduct had already been disapproved of by his superior officer, and that this was, in fact, the only offence he had committed. The French Cabinet, therefore, considers that, in recalling M. d'Aubigny, all the reparation is offered which the case requires. It is added that M. Guizot has intimated his intention to resign rather than make any further concession; and that the whole of his colleagues in the Cabinet have adopted the same resolution. In the meantime the visit of King Louis-Philippe has been postponed until October, and doubts are entertained on both sides of the Channel whether it will take place at all. Unusual preparations are making in our dockyards, and reinforcements of troops are under orders to proceed to Gibraltar. In Spain, and other parts of the Continent, the belief is general that the affairs of Morocco will lead to a war between the great Powers; and in Germany it is even rumoured that an alliance offensive and defensive against France has already been formed between Great Britain and Russia. The Italian insurgents are said to be watching the progress of events with unusual interest, and the Papal and Austrian Governments are adopting measures of precaution to meet contingencies. The visit of the King of Prussia to the Austrian Court is taken as a sign of a more intimate intercourse between the two great powers of Germany, and the present condition of the world proves that a rupture between France and England would not only be a war of giants, but would involve Europe in its consequences.

At home, the topic of the day is the rumoured intention of Her Majesty to visit Ireland, preparatory to an amnesty remitting to Mr. O'Connell and his fellow prisoners the remaining term of their imprisonment. Whether true or not, the mere rumour has created great excitement among all parties. The Conservatives profess to disbelieve that Ministers will make the Queen a party to such a proceeding, while the Repeal organs openly declare that an amnesty would neither be received as a favour, nor turn the Irish people from their purpose. The affairs of Morocco, and the possibility of a war between this country and France, have raised the hopes of the Repeal party; and it is one of the signs of the times, that several of their journals advert with evident satisfaction to the chances of a French invasion of Ireland. Another mode of obtaining Repeal, which appears to find favour with the Association, is a proposal to abstain from all exciseable articles, and particularly from those of English growth or manufacture, as a certain means of affecting the revenue to so serious an extent, that the Government will be compelled to accede to their demands. This resolution, however, has not been finally adopted, but Mr. Smith O'Brien has intimated that both Government and the people should contemplate such a determination as a probable contingency.

Home News.

COURT.—The ceremony of churching the Queen took place on Wednesday in the private chapel of the Castle, the Hon. and Rev. C. L. Courtenay officiating. His Royal Highness Prince Albert attended the ceremony. The Queen and Prince afterwards walked on the terrace and in the pleasure-grounds adjacent to the Castle, a garden-chair being taken for Her Majesty's use when required. Her Majesty in the afternoon took an airing in a pony phaeton, Prince Albert driving; and on Thursday the Queen walked in the pleasure-grounds of the Castle attended by the Lady in Waiting. Monday being the birthday of Prince Albert, the day was observed at Windsor and in London with the usual honours. In the evening the eastern terrace of the Castle was illuminated, and a display of fireworks took place at the lodges forming the entrance to the Long Walk. In London, the shipping on the river were decked in colours, the bells of the churches were rung, and the principal public buildings were illuminated. On Tuesday the Prince inspected the 2d battalion of the Scots Fusilier Guards, after which the Queen Dowager arrived at the Castle on a visit to Her Majesty. On Thursday Prince Albert, accompanied by Col. Wylde and Mr. G. E. Anson, left Windsor for the Isle of Wight, travelling by the South Western Railway. His Royal Highness was received with the usual honours at Portsmouth by the Lords of the Admiralty who are now on a visit of inspection at that port, and after visiting Osborne House, near Cowes, the Prince inspected the Collingwood line-of-battle ship, at Spithead, and returned to Windsor Castle to dinner. The Viscountess Canning has succeeded the Countess of Dunmore as Lady in Waiting on the Queen. There is now no doubt that the contemplated visit of the King of the French to the Queen has been postponed for about a month, if it be not altogether abandoned. The middle of October, however, is mentioned as the probable period for the arrival of His Majesty in the event of his visiting England. Her Majesty and Prince Albert with a portion of the Royal Family are expected to set out on their marine excursion about the 9th Sept., and proceed to the coast of Hampshire, to embark on board the Royal Yacht. The Prince of Wales, the Princess Royal, and the Princess Alice will, it is expected, accompany the Queen to the Isle of Wight. Her Majesty and Prince Albert, it is said, will shortly afterwards proceed to Scotland in the yacht, leaving the Royal Family at Osborne House, where it is expected they will remain until the return of the Queen and the Prince from the north. It is believed that Her Majesty's marine excursion and series of visits to the Scottish nobility will occupy from three to four weeks. The Duchess of Gloucester has relinquished the Royal residence at Bagshot, and has removed to the house lately occupied by Lord Sidmouth, in Richmond Park, in order to be near her sister. Orders were issued in last night's *Gazette*, from the Lord Chamberlain's Office, for the Court to go into mourning to-morrow, Sept. 1, for the late Grand Duchess Alexandra of Russia, to change the mourning on Thursday the 5th, and go out of mourning on Monday the 9th.

THE PRINCE OF PRUSSIA.—Prince William of Prussia attended by his suite, after devoting nearly three hours on Thursday morning to an inspection of the attractions of Chatsworth, left the Chesterfield station for York. The York race meeting being held on that day, His Royal Highness was invited to visit the course, and having acceded to the request, took his seat in General Brotherton's carriage. He was attended by a troop of cavalry, and dashed off at a rapid speed towards Knavesmire. Unfortunately the race for the great stake of the day had been run about ten minutes before his arrival, and only one race remained, the Queen's 100 guineas, which was walked over by Alice Hawthorn. On the return of the Royal party from Knavesmire they proceeded to the cathedral, on leaving which they returned to their hotel, and having partaken of refreshment, left York about half-past six for Darlington, by a special train, accomplishing the distance (45 miles) in an hour and thirteen minutes. His Royal Highness reached Newcastle shortly before midnight, and immediately proceeded northward to Edinburgh, where he arrived about noon on Friday. The Prince immediately visited the Castle, Holyrood Palace, the Calton Hill, and ascended to the top of Nelson's Monument. He next visited the tartan warehouse of Messrs. Paterson and Romanes, where he made extensive purchases. The Prince then proceeded to Glasgow, and on Saturday visited the Cathedral and the Royal Exchange, and took his departure by the mail for Carlisle, where he passed the night. On Sunday he proceeded to Lancaster, and having taken a view of the castle, and other objects of interest in that city, left by railway for Parkside, and thence to Liverpool. On Monday His Royal Highness visited the Brunswick Dock, Custom-house, the Royal Mail steamship Britannia, steamed along the line of docks, visited the Waterloo and Prince's Docks, the Fish-market, Assize Courts, and the Town-hall. In the evening His Royal Highness left by railway for Warwick, where he inspected the castle, and then proceeded by Hampden to Drayton Manor, on a visit to Sir R. Peel. On Tuesday the Prince took his departure for Apethorpe, the seat of the Earl of Westmorland, visiting Belvoir Castle on his way. On Wednesday His Royal Highness visited Fotheringay Castle, the scene of the execution of Mary Queen of Scots, and Burleigh House, the seat of the Marquis of Exeter, returning to Apethorpe to dinner. On Thursday the Prince proceeded by the London and Birmingham Railway to Badminton, the seat of the Duke of Beaufort. On leaving Badminton His Royal Highness is expected to proceed to Windsor, on a visit to Her Majesty, and is expected to remain at the Castle till the following Thursday or Friday.

Death of Lord Keane.—His Lordship's death took place on Monday last, at the family seat in Hampshire, from the effects of dropsy, with which his Lordship has been for some time afflicted. John Keane, Baron Keane of Ghuznee, in Affghanistan, and of Cappaquin, county of Waterford, in the Peerage of the United Kingdom, a Lieut.-General in the Army, was born in 1781, and married first on the 10th August, 1806, the second daughter of the late Lieut.-General Sir John Smith, by whom he had several children; the eldest son, the Hon. Major Edward Arthur Wellington Keane, Captain in the 37th Foot, and Aide-de-camp to the late Lord while in command of the army of the Indus, succeeding to the title. His Lordship, who was the second son of the late Sir John Keane, Bart., of Belmont, Waterford, was raised to the peerage as a reward for distinguished military services in Affghanistan, and especially at the storming of the fortress of Ghuznee.

Law Appointments.—The Queen has been pleased to appoint John Adams, Esq., Serjeant-at-Law, and youngest son of Simon Adams, Esq., late of Ansty-hall, Warwickshire, Assistant-Judge of the Court established by the new Bill for the better administration of Criminal Justice in the county of Middlesex.

Foreign.

France.—The following telegraphic despatch, announcing the bombardment and destruction of Mogadore, and its subsequent occupation by the Prince de Joinville, reached Paris on Monday:—"The Prince de Joinville to the Minister of the Navy.—On the 15th we attacked Mogadore. After having destroyed the town and its batteries, we took possession of the island and of the port. Seventy-eight men, including seven officers, have been wounded or killed. I am engaged in establishing the garrison of the island. I have put the port in a state of blockade." The following important despatch from Marshal Bugeaud was received two days previously:—"The Governor-General of Algeria to the Minister of War.—Bivouac of Koudiat-Abd-er-Rhaman, the 4th.—Having marched against the Moorish army, which was daily becoming stronger and more threatening to Algeria, I encountered it on the 14th, at two leagues in advance of its camp. It assumed the offensive with 20,000 horse, at the moment when our *têtes de colonnes* were crossing the Isly. We were enveloped on all sides. We have obtained the most complete victory. Our infantry, which was of extreme solidity, and also our cavalry, achieved prodigies of valour. We successively took all the camps, which would cover a space of more than a league. Eleven pieces of cannon, sixteen standards, between a thousand and twelve hundred tents—one of them belonging to the Emperor's son, his parasol, the badge of his command, all his personal baggage, a large quantity of war ammunition, and immense booty, have remained in our power. The enemy have left about 800 dead on the field of battle. Our losses, although severe, are light for so brilliant an action, which we shall call the Battle of Isly." The ministerial papers add to this announcement that the Moorish army reckoned 24,000 cavalry. The enemy must, moreover, have had a numerous irregular infantry; and probably, also, regular troops to defend and manage their artillery. Marshal Bugeaud had under his command only 7000 infantry, 1400 cavalry, and 12 pieces of cannon. In reference to the Prince de Joinville's bombardment it is worthy of remark, that neither his official despatch relating to this affair, or to that of Tangiers, have yet been published. A letter, however, has reached London, from the agent of Lloyd's, at Gibraltar, stating that "the Moors are reported to have fought with great bravery, and that they opened fire from the batteries when they found the 3 line-of-battle ships were about to take up positions at 2 o'clock P.M. on the 15th inst. The cannonade lasted till near sunset, when the steamers towed off the large ships to the regular anchorage ground. At night there was firing between the contending parties till ten o'clock, when the Hecla departed, and till eleven o'clock, at a distance, firing was still heard. This firing was between the shore and the steamers with small French sailing vessels of war. Mr. Willshire, our Consul, and some other British subjects, were not allowed to embark, owing to some local regulations relative to Custom-house engagements. Admiral Sir E. Owen has despatched the Vesuvius to Mogadore, where Her Majesty's ship Warspite was lying for the protection of British interests. At Tangiers everything was quiet, and order prevailed. The markets were reopened and trade resuming; the defences were about to be repaired, and the savage tribes in the neighbourhood had dispersed." The remarkable fact adverted to in our last, that the Prince bombarded Tangiers before Mr. Hay's return with the answer of the Emperor, has been explained by the announcement that the French steamer which arrived from Oran early on the morning of the attack brought express orders from Marshal Bugeaud that no further time should be lost, but that the Prince should instantly open his fire upon Tangiers. These instructions caused the attack to be so suddenly commenced, and the position of Marshal Bugeaud at the time, with respect to the Moorish army by which he was menaced, is said to justify his anxiety that a diversion should be made at Tangiers.—The destruction of Mogadore has caused another fall in the French Funds, and serious apprehensions are expressed in Paris lest a collision take place with the British squadron. Several of the papers state that the Admiralty Council are bestowing the utmost attention on the state of the Navy, and that they have declared that operations must be carried on with the greatest promptitude on the coast of Morocco, whilst Marshal Bugeaud acts with equal energy on the frontier of that country. The Marseilles prints state the report to be current at Toulon that orders have been received to make preparations for the embarkation for Algeria of not less than eighteen or twenty thousand men.—All the papers contain articles filled with violent censure of the letters from our officers at Tangiers, which were originally published in the *Times*, and quoted in our Paper last week. They all discuss them at great length, and yet declare that they are only worthy of contempt. The *National* even states, that "it was suggested on Saturday in different quarters of Paris that the officers and legions of the National Guard should prepare a petition, protesting against the indifference and inactivity of the Ministry in presence of the miserable insults which the English Government has caused to be addressed to our navy and to the entire country." Whether this be true or not, it is quite certain that the publication of the criticisms of the English officers has created an immense sensation in Paris; and it is said that in the Tuileries the feeling it has occasioned is a very painful one. One effect produced by that and by the other important questions pending at the present moment between France and England is understood to be the postponement of Louis-Philippe's voyage to this country. It is said that an officer was despatched from the French capital on Friday to Cherbourg and Brest, with orders to stop the preparation of the ships which were to have accompanied His Majesty to England. Should this turn out to be the case, the circumstance will be regretted in England; but, at the same time, the relations between the two countries have recently taken so threatening an aspect, and so many questions have arisen which may lead to difficulty, that some delay of His Majesty's visit is not to be wondered at.—It appears that the Turkish fleet, which the French Government professed to believe was on its way to Tunis, was, according to the Levant papers, on the coast of Syria at the end of July, without the slightest intention of directing its course towards Tunis. The pretence, however, was made use of to enable the French Government to make a large addition to its fleet in the Mediterranean, without exciting remark or suspicion, and accordingly four ships of the line and two frigates were sent out. England has one ship of the line and some smaller craft in the Mediterranean. France has now eight ships of the line, besides a great number of frigates and smaller vessels, and another line-of-battle ship has been sent to the Prince de Joinville. In regard to Tahiti, it is stated by the *Presse*, a paper in general favourable to the French Cabinet, though very hostile to this country, that a report was current on Sunday that the English Cabinet, after having taken the opinion of the law officers of the Crown, had decided that an *ultimatum* should be addressed to the French Government, demanding the disavowal of MM. Bruat and d'Aubigny, and that in the event of a refusal Lord Cowley was to apply for his passports. This report is disbelieved by other papers, but it was generally supposed in Paris that the *ultimatum* had arrived, and that it was true that the English Government demanded the recall of both MM. Bruat and d'Aubigny, but that though M. Guizot was willing to recall M. d'Aubigny, he declined to do so in respect to M. Bruat. Another point upon which there is said to be some difficulty is this. The British Government demands that the reparation should be made publicly and published in the *Moniteur*. This M. Guizot is said to decline, notwithstanding Louis-Philippe's wish that such a condition should not stand in the way of an amicable arrangement of the question. The *National* says, that the demand has been the subject of grave discussion; that M. Guizot, Admiral Mackau, and Lord Cowley were at the Palace of Neuilly till a late hour on Saturday night, and that Lord Cowley dispatched a courier to London at an early hour on Sunday morning.—One of the French journals contains a denial of the charge brought some time since by Mr. Forster, M.P., relative to the French occupation of the Gaboon river, on the African coast. It was said that the King, or chief of the district, had been made drunk by a French captain, and that whilst in that state he had been cheated into signing a bond making over to his French friends all his territory and powers. The *Courrier de Havre* positively denies the story, so far as the intoxication goes, but admits that Captain Amouroux, the commander in question, had made use of the influence which his commercial connections gave him with the African chief for the cession of two points on the banks of the Gaboon, where the French have now establishments. The Havre journal adds, that so far from being prejudiced against the English on the African coast, M. Amouroux had risked his life in ascending the Gaboon to a considerable distance in the interior, in order to rescue from the savages four shipwrecked English sailors, and that the Lords of the Admiralty had sent him a chronometer, as a mark of their approbation.—The Count de Paris entered on Saturday on his 7th year, having been born on Aug. 24, 1838. Consequently, according to the terms of the Regency Bill, in twelve years, on the same day, he will have attained his majority.—On Wednesday counsel applied to the Court of the Civil Tribunal of the Seine, on the part of Marie Taglioni, the celebrated Opera-dancer, for a divorce *à mensâ et thoro* from her husband, M. Gilbert des Voisins, in consequence of his having refused to admit her to his house. Counsel on behalf of M. Gilbert resisted the application, on the ground that his refusal was justifiable; Madame Marie having violated the engagement contracted by her at her marriage, to renounce the theatre, and that during 10 years she had lived separate from her husband. The President delivered the judgment of the Court, and pronounced the separation demanded by Madame Taglioni, founding it on the serious injury resulting from the refusal of M. Gilbert to receive his wife at his dwelling-house.

Spain.—The Madrid journals of the 21st, upon rather questionable authority, announce the departure of Mr. Lytton Bulwer for Morocco. The occurrence was generally talked of, and hopes were entertained of his being more successful than Mr. Drummond Hay in his negotiations. "Our Government," says the Ministerial print *El Heraldo*, "not having been content with the satisfaction afforded to Spain by the Emperor of Morocco, who avoids replying to some of our claims, the Minister Plenipotentiary of Great Britain has proceeded direct to Morocco, in order to put a stop to the differences, and obtain a satisfactory settlement of our quarrel with that empire. Nor is Mr. Bulwer's journey unconnected with the differences existing between France and our neighbours of Africa."—The two Queens, the Infanta, and the Court, arrived at Madrid on the 21st. Their Majesties chose the extraordinary hour of three in the morning to make their entry, but the reason for such a choice is not known. Some said it was on account of the young Queen's health, others, that it was a scheme of Narvaez's, in order to create doubt and fear of danger, both in the minds of the Court and the public. The health of the Queen and the Infanta is unsatisfactory, but the Government papers take all the means in their power to assure their readers that nothing is the matter but fatigue. The office of Minister of Foreign Affairs is not yet filled up. M. Martinez de la Rosa, or M. de Miraflores, are spoken of as most likely to be appointed, but nothing appears to be settled. Numerous arrests continue to take place at Madrid, in connexion with the pretended plot against the Government; and accounts from Gibraltar state that an agent of the Government had been detected in the act of inducing the other refugees to land on the Spanish territory, where arrangements had been made for taking them prisoners, when they were to be immediately shot. The garrison of Gibraltar is to be reinforced by another regiment, and another company of artillery. The 72d are hourly expecting the order to march to Cork, and embark thence for that garrison. The last accounts received from Gibraltar speak of the serious illness of Mr. Drummond Hay, occasioned by his exposure and hardships incurred during his journeys in Morocco in the endeavour to adjust the serious quarrels in which the Emperor had involved himself. Mr. Peel, son of Sir Robert, and *attaché* to the British Legation, arrived at Madrid on the 20th, from a tour in the South of Spain.

Germany.—Accounts from Berlin state that, since the attempt against the life of the King of Prussia, every person suspected of professing liberal sentiments was exposed to continual vexations, at the same time that the censorship, which insinuated that it was not an individual, but an opinion, that had armed itself against the King, redoubled its measures of rigour. They also mention several instances in which the deluded populace had assailed in their domiciles political writers of the most inoffensive character. So general is the feeling of abhorrence excited by the late attempt on the King's life, that the deputies of the states of the circle of Nimptsch, in which is Klein Kreignitz, the native place of Tesch, have ordered the parsonage-house of the town, in which Tesch was born, his father being the Minister, to be demolished and rebuilt. It appears that the King and Queen of Prussia during their late journey, at the last stage previous to reaching Ischl, had a most providential escape from an accident, which might have been attended with melancholy results. There was a thunder-storm, at which the horses of the Royal carriage became affrighted, but all danger was happily removed by the presence of mind of one of the King's Chasseurs, who sprang forward from the rumble and cut the traces and front harness, by which means the horses were removed from the carriage, and the impending danger arrested. The King of Bavaria arrived at Berchtesgaden, on his return from Italy, on the 18th inst. In addition to the Crown Prince, Prince Luitpold, and Prince Charles of Bavaria, and the Electoral Prince of Hesse, who have repaired to Berchtesgaden to welcome his Majesty, the Dowager Empress of Austria is also expected.—The *Augsburg Gazette* mentions a report from Trieste, that the Bellona, Austrian frigate, on board of which is Admiral Bandiera, had received orders to sail for Morocco.—The *Nuremberg Correspondent* states that the Germanic Diet has already come to a resolution respecting the claim to the title of "Highness," made by several reigning Dukes. The parties concerned, however, have been the only persons to whom the decision has been communicated. It is known that the various princes have already assumed this title by anticipation, but the five powers have conceded the title only to the Grand Dukes and to the Elector of Hesse-Cassel. The Confederation, it is said, has not adhered to this concession.—The disturbances among the manufacturers of Prussia are on the increase. A letter from Warbourg states that the village of Helrued is in full revolt, and that the Government was taking active measures to put it down.—The *Cologne Gazette* says that Eugene Sue's "Wandering Jew" has been stopped at the frontier, and all the German papers which published any part of it seized. Lord and Lady Palmerston arrived at Ems on the 20th, on their way to Worms, where several leading members of the Whig party were expected to assemble.—The *Journal des Débats* announces that the colossal statue of Goethe which was cast in bronze at the Royal Foundry of Munich, according to the model of Schwanthaler, has been completed and exhibited to numerous visitors. This statue is intended to ornament one of the squares of Frankfort-on-the-Main, his native place. Goethe is represented clad in a mantle, but having his hands free. He wears the simple costume of the present period. His right arm is resting on the trunk of an oak tree, and in his left he holds a laurel crown. His eyes are turned towards heaven. The subjects of the bas-reliefs on the pedestal are borrowed from the works of Goethe. In the front three female figures represent the natural sciences, and dramatic and lyric poetry. On the opposite side is seen, at the right Goëts of Belichingen, Egmont, Tasso, and a fawn. On the left the Bride of Corinth, Prometheus, and the King of the Aulmes. One of the lateral surfaces represents Iphigenia, Orestes, Thoas, Faust, and Mephistophiles, and the other Mignon, Wilhelm Meister, the Harpist, Hermann, and Dorothea.

Belgium and Holland.—Letters from Brussels state that since the journey from London to Brussels can be performed in one day, the number of visitors from

England increases daily; so that five new hotels, opened since the establishment of the Northern Station, are scarcely sufficient to receive them. In the public walks, the theatres, the coffee-houses, nothing is heard spoken but English; and it is observed that the middling classes of the citizens of London now indulge in those excursions which were formerly reserved for the opulent members of the aristocracy. Almost everybody is now able to take the pleasure of a journey of 60, 80, or 100 leagues. A great number of German travellers also pass through for England, most of whom allow a day or two to visit Brussels. The Batavier steamer has run ashore at the mouth of the Spye on the Dutch coast, where she has been since Tuesday last; and the Havre steam-packet is also ashore on the Old Maase; both have discharged their cargoes into lighters.

SWITZERLAND.—An article published by the *Basle Gazette*, of the 19th inst., would indicate that the Valais was on the point of being invaded by volunteers from the neighbouring cantons. "Enlistments to that effect," it says, "were making on a large scale in the districts of Aigle, and on other different points along the lake. At Onchy two hogsheads full of ball cartridges were embarked for Lower Valais, and concealed in a small tower near the lake. Muskets, purchased at St. Etienne, were also forwarded to the same destination. It was reported that the Valais intended to separate from Switzerland and unite with Piedmont."

ITALY.—Letters from Leghorn state that Austria is so well aware of the dangerous position to which the evils of pontifical misgovernment has brought the Papal States, that it has opened negotiations with the Holy See, with a view to the secularisation, as far as possible, of that Government. The Court of Rome resists, and will continue to do so, and it is said that the Austrian Government, foreseeing that circumstance, has addressed the French Cabinet, to invite it to join with Austria, Naples, and Tuscany to oblige the Pope to make such reforms as the safety of Italy may demand. The King of Sardinia is not included in the negotiation, from which it is supposed that he is opposed to it. Letters from Florence state that the discontent in the Legations, upon which the military commissions and executions appear to have had but little influence, will, it is generally believed, assume a more palpable form, if the affairs before Tangiers confirm the belief entertained in Italy that a war between the great Powers is impending. Many symptoms indicate the anxiety of the Papal Government, and the precaution it is adopting to meet contingencies. Under any circumstances, if amelioration do not take place in the Papal system of administration ere long, it is believed this winter, but at all events the next, will not pass over without serious troubles in Italy.—A peculiar fever has raged in Florence, but is now happily on the decline; it is a species of spotted fever, which generally carries off its victims in four or five days. It was known formerly in Italy, but has not made its appearance during a period of 60 years. Towards the end of the last century it ravaged Bologna, decimating in the space of a few weeks the entire population. It has not been so malignant in its last visitation as on former occasions, and there is no mention of any English or French who have been carried off by it. The youthful Archduke Rainer, third son of the Grand Duke of Tuscany, died on the 14th inst. at the Villa Catagiole, at Florence; and the wife of Prince Prospero Sciarra Colonna, born Princess Donna Maria Pignatelli di Monte Leone, in Sicily, has died at Rome suddenly in her 42d year. This distinguished lady was one of the celebrated Cortes family, to which Ferdinand Cortes, the conqueror of Mexico, belonged.—It was feared that the recent political events in Italy would have proved an obstacle to the meeting of the Italian scientific congress, appointed to be held in Milan; but the uncertainty which existed has been removed by the official announcement of the President, Count Borromeo, just issued, stating the meeting to be positively fixed for the 12th of next month. His Royal Highness the Duke of Bordeaux (Count de Chambord), is at Venice. Viscount Chateaubriand, after a tour in Germany, will join his Royal Highness there, where many of the leading Legitimists of France intend also to repair to pay their court to the Royal Duke.—A letter from Naples states that the King has just appointed a commission of seven members to report commercially and scientifically on the Isthmus of Panama, and a great part of the coasts of America bordering on the Pacific. A frigate is to be placed at their disposal, and it is believed that they are to repair to the East Indies and China to seek out means of establishing commercial relations between these countries and the kingdom of the Two Sicilies.

GREECE.—Letters from Athens of the 11th inst. state that the Minister of Justice had resigned his office. That Minister, it appears, had written to the commander of the Gendarmerie at Patras that he must by fair or foul means carry his election in that town, and have recourse to the sword if necessary. That officer, who was not considered sufficiently zealous by the Cabinet, having been superseded in his command, repaired to Athens, and laid before the King the letter of the Minister of Justice. His Majesty immediately sent for the latter, and asked him if he had given such instructions. The Minister replied in the affirmative, and added, "This, Sire, is the system of the Cabinet." His Majesty, greatly irritated by that reply, said to him—"Do you think, sir, that the writer of such a letter can hold a portfolio?" The result of this incident was the resignation of the Minister, whom the King refused to replace until the meeting of the Legislature. Since this occurrence M. Mavrocordato and his colleagues have resigned, and the King has empowered M. Coletti to form a new Cabinet. The country was tranquil. The *Greek Observer* of the 10th August publishes a decree proclaiming a political amnesty in the following terms:—"Otho, by the Grace of God King of Greece.—Upon the proposition of our Council of Ministers, we have decided and do ordain: Art 1. We grant an amnesty to those who have taken a part in the insurrectionary movement which took place in Acarnania and in Western Greece during the months of May and June last. 2. Theodore Grivas, Protopapa, Demetrius, Tarcasica, Nicolas I. Sollio, Costulla, Chasapi, Constant Colocytha, Sp. Macristate, and Costa Capo Georgachi are excepted from the benefit of this decree. 3. We reserve, should it become necessary, the exercise of our clemency to the persons excepted after their judgment."

RUSSIA.—The Emperor has announced to his people the lamented death of his daughter in the following manifesto:—"By the inscrutable decrees of God our paternal heart has been visited with a severe affliction. Our dearly beloved, the Grand Duchess Alexandra Nicolajewne, consort of Prince Frederick of Hesse Cassel, after a long and severe illness, was prematurely delivered on the 29th of July (10th August) of a prince, who was baptised by the name of William, and died soon after. Our beloved daughter expired shortly afterwards. With deep sorrow, yet humbly resigned to the mysterious will of Divine Providence, we doubt not that all our faithful subjects, who so lately manifested such cordial participation in our joy on the marriage of our beloved daughter, will now unite with us in feelings of grief, and in prayer to the Almighty for the repose of her pure and gentle soul in the eternal mansions of the virtuous." On the day of the death of the Princess the court went into mourning for several weeks. It appears that after the delivery of the Princess she felt herself relieved, and conversed for a considerable time with her beloved parents, brother, and sister, and other relatives, who were all assembled round her during the last hours of her life. At four in the afternoon she took an affectionate leave of them all, and fell into a tranquil sleep, from which she never awoke. She expired at a quarter before five. The body of the Grand Duchess, as well as that of the Prince, were embalmed and buried without pomp in the cathedral of St. Peter and St. Paul. The *Wurtzberg Gazette* says that a courier arrived from St. Petersburg at Berlin on the 19th, bringing dispatches for the Russian ambassador, to inform him that the Emperor of Russia would soon arrive in Berlin in company with the Empress, and that the Empress would make a considerable stay at the Court of Prussia. Extremely unfavourable accounts have been received at St. Petersburg respecting the operations in the Caucasus. It is said to be certain that at the end of May and in the beginning of June the Russians lost in the combats with the Circassians nearly 10,000 men, ten important fortresses, several small forts, a number of cannon, and some very important positions. Besides this many tribes hitherto neuter have joined the mountaineers. It is reported that the latter have since obtained further advantages. The war department seems to be engaged in preparing measures to repair the losses that have been sustained. There is said to be no doubt that the Emperor will go to the Caucasus.

TURKEY AND SYRIA.—Letters from Constantinople of the 7th inst. state that the intelligence from Alexandria had produced a lively sensation in the Turkish capital. The Ministers immediately met in council at the country seat of the Grand Vizier, and the result of their deliberation was, that Masloum Bey, the Minister of Justice and Chargé d'Affaires of Mehemet Ali, should repair forthwith to Alexandria to inquire into the real situation of affairs. Masloum Bey accordingly embarked on the 7th in the French steamer to fulfil that important mission. The last packet from Salonica conveyed to Constantinople 227 other Albanian prisoners, among whom were several chiefs, who were thrown into prison to await their trial before the Superior Council of Justice. Sir S. Canning has obtained satisfaction for the insult offered by a Russian pilot to the British flag, and the pilot is to be punished in an exemplary manner.—Letters from Jerusalem of the 18th ult. state that a considerable sensation still existed there amongst the French and other Christian population, on account of the murder of the French Consul's servant. It was even said that the Consul was so alarmed at the appearance of affairs, that he would write to his Government to supply him with means of protection for the French now in his neighbourhood. The Ottoman fleet, with the exception of two ships of the line stationed at Tripoli, was still lying at anchor in the roads of Beyrout on the 25th ult.—A Frankfort journal contains a letter from Belgrade, Aug. 5, which states that the ex-Consul of England at Novi-Bazar, Prince de Vasovitch, has been massacred by the Turks at about two leagues distance from the Servian frontier of the Mokaragora road. A Christian who accompanied him succeeded in escaping to the quarantine establishment of that town. The family of the unfortunate gentleman thus killed has inhabited Belgrade for several years, and is much respected.

EGYPT.—We learn by the Levant mail that Mehemet Ali has relinquished his announced retirement to Mecca, that he continues to administer the affairs of Egypt, and was on his return to Alexandria. Among the numerous accounts of this extraordinary proceeding, the following summary from the private correspondence of the *Morning Post* is both the clearest and most connected narrative. It appears that about the middle of last month the Viceroy had been extremely ill from dysentery, and his recovery was very slow. Suddenly, on the 26th ult., from some cause which even now is not positively known, the Pacha got into a fit of silent rage, went off to a kiosk in the neighbourhood of Alexandria, and the following day, after having refused to see any one, proceeded to Cairo, declaring his intention of performing a pilgrimage to Mecca. He was only accompanied by a Bey, and his physician and apothecary, having positively refused to see Ibrahim Pacha or any one, either of his family or the Ministers. This sudden departure of the Viceroy was attributed by some to madness, and by others to the discovery of a plot against his life; in short, all kinds of reports were in circulation, while no one knew which to give credit to. The Foreign Consuls-General met in consultation, and, in consequence of the reported abdication of the Viceroy, they drew up and presented a requisition to his Highness, requesting to be informed if such was the case, and, if so, to know to whom they were to address themselves in his absence, and by whom the government was to be carried on. For answer, they were told to address themselves to whomsoever they pleased; that he (the Viceroy) was tired of everybody, and that, as everybody was tired of him, they had better separate; and, for his part, he intended going on a pilgrimage to Mecca. Upon this, the diplomatic corps addressed themselves to Ibrahim Pacha, to know whether he intended assuming the reins of government, but he declined entering into the matter at all, saying, that as long as his father lived he would not interfere in the affairs of government. The Viceroy thus left the Consuls-General to write to their respective Governments whatever version of the affair best pleased them, and on his arrival at Cairo, he shut himself up, still refusing to see any one, but giving orders that a good Turkish physician should be found, to accompany him to Mecca, and he also caused a large sum of money to be sent on to Suez to defray the expenses of the journey. Day after day passed on in this state of affairs, reports of all kinds floating about, particularly one to the effect that the Viceroy insisted upon the existence of some great plot against him, and demanding the delivery up to him of the traitor and the miser, when they should themselves name their punishment. By degrees, however, matters began to smooth down; no doubt change of air and quiet improved the Viceroy's health, and he received his younger children, Said Pacha, who accompanied them, and one or two other Pachas. After this, Artin Bey, Secretary of State for Foreign Affairs, addressed a circular to the diplomatic corps, in which he notified that the Viceroy's health was restored; that he did not contemplate retiring from Egypt, and felt quite capable of continuing the direction of public affairs. It was also announced that the Viceroy would almost immediately return to Alexandria. It is added that while some have attributed the Viceroy's conduct to madness, others consider him quite in his senses, and that this ebullition was caused by his being made suddenly acquainted with the bad state of the finance department, and the general mal-administration of the affairs of the revenue; things which, however, he must have been fully aware of twenty years ago. Another prevalent report is, that it was all a cunning *ruse* of the Viceroy's to enable him to take advantage of the general fright, and to cut down all the emoluments of the employées, from first to last, by which reduction in salaries he would save a million of dollars annually. Perhaps the most probable cause of all that has taken place is, that his Highness was really labouring under delirium, brought on by previous illness and great weakness, subsequent use of quack medicines, &c., and that when he went off to Cairo, and for some subsequent days, he scarcely knew what he was about; that when he partially recovered, through rest and change of air, he saw the folly of his proceedings, and now wishes to completely mystify the whole affair, in order to throw people on the wrong scent and regain his former influence. Much apprehension was felt at Alexandria that the inundation of the Nile during this year would not be sufficient to produce good crops. No case of plague had been reported for some days. The Geyser was waiting at Alexandria to convey Lord Ellenborough to Marseilles. His Lordship was expected to arrive at Alexandria in a few days.

UNITED STATES.—By the arrival of the Royal Mail steam-ship Caledonia at Liverpool on Thursday night, advices have been received from New York to the 15th inst., Boston 16th, and Halifax 18th. The papers by this arrival appear to be exceedingly barren; in fact there may be said to be no news except commercial, and even that presents no feature of interest. From Canada we have nothing definite as to the formation of an administration, and there are all sorts of accounts daily sent forth by the press of both parties, but private letters state that nothing whatever has been arranged. It was generally expected at Montreal that a ministry would be formed by the middle of next month, and that the Canadian Parliament will assemble early in October. It was understood that if this be not so, the house would be dissolved, and a new election take place.

CITY.

Money Market, Friday. — Consols for account closed heavily at 98⅜. Reduced Three per Cents. 98⅜. Three-and-half per Cent. Red. 101⅝; New Three-and-half, 101⅛; Exchequer Bills 74, pm.; Bank Stock, 199; India Stock, 281.

GAZETTE OF THE WEEK—BANKRUPTS—J. T. WILDE and W. WILDE, late of Basinghall-lane, Cheapside, general merchants—W. M. UNDERWOOD, Wapping-wall, Lea-x, mulder—A. LEVY, Commercial-road Lambeth, timber merchant—R. BLACKER, Portsea, grocer—W. YOUL, 74, Cornhill, tailor—J. FOSTER, Nottingham, hatter—R. GARNER, Leeds, boot and shoe maker—J. W. LEWIS, Bath, victualler—R. CLARKE, Newcastle upon Tyne, bookseller—W. PARSONS, Upper Eaton street, Pimlico, starch manufacturer—J. SANDERS, Reach, Cambridgeshire, wheelwright—A. GODDEVE, Alder-

manbury, warehouseman—J. Lowrnan, Queen's-row, Pentonville, builder—W. Francis, Lancashire, grocer—W. A. Brooks, Newcastle-upon-Tyne, quarryman—R. Hodgson, Newcastle-upon-Tyne, grocer—T. Patterson and J. Collins, Durham, earthenware-manufacturers—E. Rogers, Liverpool, corn-merchant.

Metropolis and its Vicinity.

The Recent Post-Office Disclosures.—The examination of parties implicated in the recent cases of letter-opening at the General Post-office is concluded. Besides the letter-carrier Tapson, upon whose seat in the northern office the two letters which led to the discovery were found open, the men delivering Cavendish-square district, North Audley-street, Grosvenor-place, Connaught-square, as well as others employed to ring bells at night in several western localities, have been subjected to rigid examination, first before the superintendent of the inland and letter-carrier department of the General Post-office, and then by the solicitor to the establishment. When charged upon the evidence of Tapson's book with having obtained their information from the opening of the letters of Lord G. Bentinck and others, the fact was readily admitted by all the parties then charged, and the chain of evidence was shortly completed, that the information had been furnished to parties who were willing to pay for it. Indeed, it was the regular practice of some of the parties to visit Tattersall's, and, being distributed during the day in different parts of town, while one of them was in attendance on business at the west-end, others were busily engaged at the several sporting houses in the Metropolis. Here it was that they employed their information, and by these means netted a considerable sum.

Medical Protection Society.—On Monday, a numerous meeting of general practitioners was held in Exeter Hall, to receive the report of the committee of the Medical Protection Society, and to take into consideration Sir J. Graham's proposed Medical Reform Bill, Mr. Carpue in the chair. The report having detailed the proceedings of the committee for securing to the profession their rights, stated that they sought a communication with the Council of the College of Surgeons, which was refused, and that they subsequently begged an interview with the Home Secretary, which Sir J. Graham refused on the ground of pressure of business. The report, in conclusion, condemned the conduct of the council and Sir J. Graham's Reform Bill. Several resolutions sanctioning the report were adopted, and a committee was appointed to devise what course the assembly should pursue. The committee withdrew, and after a short absence returned, and proposed a resolution that they should meet again early next month, to reconsider the conduct of the Council, and to strike out for themselves a course of procedure on the expiration of the charter lately granted the College of Surgeons, which takes place on the 14th September. Mr. Wakley, M.P., denounced the measures of the Council and Sir J. Graham's Bill, and said that it depended upon the 11,000 members of the profession to correct the one and prevent the other being carried. Several gentlemen addressed the meeting, and the resolution was carried.

New Medical School.—A society of physicians and surgeons is in course of formation, for the purpose of establishing a school for the instruction of the children of medical practitioners, upon the principle of the Royal Naval School at Deptford, and that for the Sons of the Clergy at Marlborough. The chief object contemplated in the foundation is that of giving to youths intended for the medical profession a more liberal education than they usually have before commencing their apprenticeship.

Frauds upon the Excise.—Within the last few weeks the officers of Excise have discovered numerous illicit stills in various parts of the Metropolis and suburbs. Among others, the officers were induced to visit the chemical factory of Mr. Barker, in Cross-street, Blackfriars-road, and upon examination they found several secret trap-doors, leading to an excavation underground in the cooperage-yard belonging to a person named Bryant. The upper portion of the range of buildings was used for chemical purposes, strong acids being prepared, with a view of counteracting the pungent smell arising from illicit distillation. The officers descended one of the secret trap-doors armed with a crowbar and firearms; but although they could discover in a secret and inner chamber a man at work, they were unable to effect an entrance to capture the offender. After considerable exertions the officers obtained a forcible entrance into the distillery, and there found, on passing through massive oak doors, three stills in perfect working order, with the spirit running off from one of them, a large quantity of molasses, molasses spirits, and upwards of 500 gallons of wash. So perfect was everything to enable a successful operation to be carried on, that the officers found it necessary to employ five waggons to remove the plant, &c., to the chief office in Broad-street. The workmen, by well-concerted signals, managed their escape. Since the above affair a second discovery has been made of a minor establishment in Little Collingwood-street, Blackfriars, supposed to belong to the same gang.

Metropolitan Improvements.—The Metropolitan Improvement Commissioners having determined on opening a direct line of communication between the new Houses of Parliament and the north-west district of London, several plans were sent in, many of which were rejected owing to the great expense of compensation in that locality. The line has at length been definitively marked out, and a contract concluded for two-thirds of the work. The new street will commence at the western extremity of the new Houses of Parliament, running in an oblique line from Abingdon street to Eaton-square, from which point there is already a continuation to the Great Western-road. By this project two desirable objects will be attained: it will afford a nearer and more convenient approach to the Houses of Parliament, Law Courts, and Government offices from Pimlico, whilst the removal of the obscure streets, courts, and alleys in that part of Westminster will remove an acknowledged nuisance. The line will traverse the worst part of Westminster, where the dilapidated tenements are of comparatively little value. The majority belong to the Dean and Chapter, and as the existing leases are nearly run out, the present occupants' claims to compensation will not be very large. The new street is to be of the width of Regent-street, and of nearly equal length. Mr. Rigby Wason, late Member for Ipswich, has entered into a contract, by which he binds himself, under a penalty of 10,000*l.*, to complete two-thirds of the line at 34 per cent. less than the Government Surveyor's estimate; and he guarantees that the remaining one-third shall be executed at the same rate as the estimate. Mr. Wason having undertaken this contract, has issued an address to the electors of Ipswich, in which he announces that he will not stand for their borough at the next election, as he is thus disqualified from sitting in Parliament. Connected with the above improvement, a project has been revived for the erection of a bridge across the Thames, from the Horseferry-road to Lambeth-stairs, at the foot of Church-street, close to Lambeth Palace. This scheme was mooted nearly 20 years back; a prospectus was at that time issued, and a Bill brought into Parliament with a view to the issue of shares for building a bridge by a joint stock company. It met with so little support that the Bill was rejected, and the project was consequently abandoned. However, it seems that it is now regarded with more favour; and it is said that the Archbishop of Canterbury and the Marquis of Westminster have withdrawn their opposition.

Mr. Dyce Sombre.—This gentleman, whose name has latterly been so much and so painfully before the public, has addressed the following letter to the daily papers:—"Boulogne-sur-Mer, Aug. 24.—Sir,—When in town last June, under the special guarantee of the Lord Chancellor, having met Sir F—— B—— near the Junior Service Club, but who I would have seen, notwithstanding this, before I came abroad, it was then and there agreed that a meeting of honour should take place between him and myself when out of the jurisdiction of the Lord Chancellor. Since which, the Chancellor having broken his faith, I took an opportunity of leaving my lodgings unobserved by the police, who were placed to watch my motions, and having left town on the 14th, reached this place the following day—on the 16th. I addressed Sir F—— B——, reminding him of his solemn engagement, and stating that I should remain for him at this place to the 20th. Having received no reply, I again wrote him on the 21st, telling him, that unless he answered by return of post, and gave a satisfactory reason for not writing before, I should post him as a coward and a man of no honour, which I now do most publicly. You will oblige me by inserting this letter in your valuable paper, and I remain, Sir, your very obedient servant, D. O. Dyce Sombre."—Since writing the above, Mr. Sombre has left Boulogne for Paris.

The late Rev. Rowland Hill.—On Tuesday evening a public meeting was held at the Surrey Chapel, Blackfriars-road, for the purpose of commemorating the centenary of the birth of the late Rev. Rowland Hill, and also to consider the propriety of erecting a memorial to him. The Rev. J. Sherman, minister of the chapel, presided, and was supported by Mr. Pritchard, the Consul at Tahiti, and several other gentlemen. The chairman, in opening the proceedings, said that it had been suggested to him to take measures for erecting a memorial to the late Rowland Hill, formerly the minister of Surrey Chapel, now they had completed the centenary of his birth. Many plans had been recommended, but that which met with most acceptance was, that which proposed to erect within the neighbourhood of the chapel a large school-house, where a number of children might receive the blessing of a sound, liberal, and scriptural education. In addition to this, it was proposed to erect two large infant schools, one of which should be in the Borough-road. Resolutions to that effect were adopted, and upwards of 600*l.* was subscribed on the spot. Mr. Pritchard, at the close of the meeting, detailed at some length the progress of education in Tahiti and the South Sea Islands.

The Iowa Indians.—On Monday the Iowa Indians exhibited themselves and their feats in Lord's cricket-ground, St. John's-wood. The wigwams were erected by the squaws, who displayed in raising these rude tents a degree of skill and despatch creditable to their peculiar talents. There was a great variety of dances and warlike pastimes, and a match at what is called "ball-play," a sport in which the parties concerned appeared to take a lively interest and to exert themselves to their utmost. The game is different from anything of the sort played in Europe; it is played with sticks having hoops, or rings, or nooses at the ends, in which the players contrive to hook the ball when on the ground, or catch it when in the air, and throw it out again with considerable force and to a great distance. There are two parties in the game, and goals which are to be gained. This exhibition has been repeated every day this week, and certainly nothing could have been contrived more calculated for a display of the strength and agility of these strange people than by affording them an opportunity of carrying on their sports in the open air, and in such a place as this. The company assembled were very numerous, and everybody appeared gratified by the sight. The Indians themselves were highly pleased with the opportunity of enjoying the fresh air and a clear and spacious stage for their sports.

The New Insolvent Act.—A meeting of attorneys and solicitors was held on Monday, at the chambers of Mr. Clarke, in Bedford-row, to adopt measures in order to counteract the operation of this Act. Mr. Goddard, of Wood-street, was called to the chair, and proposed certain resolutions, strongly condemning the new Insolvent Act, as operating injuriously not only to solicitors, but also to tradesmen, who were compelled to give credit, and, in consequence of the new enactment, would be seriously injured; as now they had no means of recovering any debt under 20*l.*, save by an execution on the goods. A long discussion ensued, and a provisional committee of seven gentlemen was appointed to forward the objects of the meeting, and a petition was drawn up, a copy of which was to be sent to every member of the profession throughout the kingdom. The company adjourned until Monday next, when a general meeting of the profession will be held at the Gray's-Inn Coffee-house.

Public Schools.—The Queen has signified her Royal pleasure, through the Lord Chamberlain, that an additional week's holydays be granted to all the public schools, in celebration of the birth of the infant Prince, and it is intended that this indulgence should be extended, as usual, to all such school establishments as can conveniently avail themselves of it.

Marylebone and Paddington Hospital.—The acting committee of this hospital have announced the progress made towards the attainment of their object. It seems that the sum required was 15,000*l.*, and the subscriptions already announced are 14,548*l.* 4*s.*, leaving a deficiency of 451*l.* 16*s.* The committee earnestly solicit the co-operation and pecuniary aid of the public towards the establishment of the institution.

A New Church.—A short time since an anonymous letter was forwarded to the Bishop of London with the princely sum of 5000*l.*, and a request to apply the amount "for the erection of a church in the Metropolis." Since the receipt, an eligible site has been purchased by some charitable individuals, in Charlotte-street, Fitzroy-square, at a cost of nearly 5500*l.*, upon which a church will be built for a district which contains a population of more than 16,000 persons.

Effects of Wood Pavement.—At a recent meeting of the Westminster Medical Society, Dr. Copland remarked, that when wood pavement was taken up for repairs, for several inches below the surface the pores of the wood might be observed to be saturated with black matters from the decomposing of organic substances, which were carried down and absorbed by the water, and on further decomposition these would be likely to evaporate, producing some subtle form of atmospheric impurity, besides which they would be aided by the waters employed in merely watering the streets, and thus extend and prolong the influence of that low form of typhoid fever which has been so common in the Metropolis.

Destitution in the Metropolis.—Two young persons, named Mary Ann and Sarah Ann Johnson, of lady-like manners, and evidently of superior education, about four months ago engaged an apartment at No. 27, Charlotte-street West, White Conduit Fields, at the rent of 4*s.* per week. They commenced a small school, and obtained a few scholars, but they were not able to support themselves or to pay their rent, and they became involved in arrears to the amount of 2*l.* 10*s.* They were pressed for the money, or a portion of it, but were unable to answer the demand, and kept their distressed and starving condition a secret until it was discovered by their landlord, who told them if they would leave the lodging he would forgive them the whole of the rent. This, however, they declined doing. The younger sister, whose system had been wrought upon by grief, want of nourishment, and the anxieties attendant upon the school, fell into a state of consumption and insanity. Every step she heard she fancied to be a fresh application for rent, and on Saturday week a noise attracted the attention of the landlady, who proceeded up stairs to the young ladies' apartment, and found them struggling violently together. The younger sister sprung upon the other in a state of raving madness, pulled and dragged her about, and would have choked her had she not been prevented by assistance. It was not until now that the real destitution of the unfortunate creatures was exhibited. Medical aid was called in, but the younger sister lingered until the following Monday, when she expired, the doctor having no doubt that she died through want of nourishment. The remains of the deceased lay in the room with the surviving sister until Friday, when, from their decomposed state, the sister having no friends nor means to bury the body, the landlord applied to the parish authorities. A coffin was sent to the house, and the remains were interred on Monday in the burial-ground of the chapel of ease at Holloway, her sister being the only mourner. The sister has been visited by one or two humane peasons, who have afforded her temporary relief. She is a most intelligent person, and states that they were orphans of respectable parents, who came from Dumfries about ten years since. The parents died and left property, and the sisters lived for some time afterwards at Lewisham, in Kent, but in their inexperience they speculated in building, and were cheated of their money, and reduced to distress. They were often starving. Her sister and herself had repeatedly lived on

a penny loaf and cold water, in preference to exposing their distress; and on being asked if they ever applied to the parish for relief, she said they chose rather to bear their misfortunes than go to the workhouse. They had no friends, and they entered upon a small school, which was too precarious for a livelihood. The unfortunate young lady is still in the house, depending upon casual bounty, and in great grief.—An inquest was held at Deptford on Monday, respecting the death of Eliza Kendall, a poor shirt maker, aged 19, who committed self-destruction by jumping into the Grand Surrey Canal. The investigation had been adjourned for the purpose of having a medical opinion as to the sanity of the sister, who had also made an attempt on her life. It appeared that both sisters were shirt-makers, and bore excellent characters. They made shirts for a Mr. Norman, a superannuated Custom-house officer, who was the agent of Bousefield & Co., a firm in the city who employ as many as 200 young women, but as Mr. Norman had to get his profit, the poor girls only received five farthings a piece for common shirts, and threepence for fine ones, out of which they had to buy the trimmings. With very hard work they could only earn each four shillings a week, but they seldom had the opportunity of so much employment. They never had a dinner, from not being able to afford it. The deceased had lately had a quarrel with another woman, and was fined three shillings, the amount of costs; but the magistrate hearing of her distressed condition, gave her a fortnight to pay it in. She was not able to raise the sum, being out of work the whole week, and on Wednesday-week a policeman called and told her that if she did not pay the money by the following Wednesday, she would go to prison. In addition to this, as they were almost starving, she had applied five shillings, which her father had given her to pay their rent, to relieve the wants of two other sisters; and being unable to make it up, she pawned some of the shirts intrusted to them to make, or their goods would have been seized. The unhappy sister who was rescued from the canal, was here led into the room to give evidence. Her appearance excited the deepest sympathy; for, by her recent fright and privation, she seemed as if bereft of reason. She became quite insensible, but, on some restoratives being applied, she recovered, and stated in evidence the principal facts above described. The Coroner then summed up, and left it to the Jury to say whether distress had not induced the deceased to destroy herself. After a brief consultation they returned the following verdict:—"That the deceased committed suicide whilst labouring under a fit of insanity; and the Jury cannot but deprecate the cruel practice of the slop-sellers in London, of employing young females at needle-work at so low a rate of wages as to preclude the possibility of a subsistence."

Death of Sir W. Heygate.—On Thursday, intelligence was received at the town clerk's office of the death of Sir William Heygate, Bart., who was elected about a year and a half ago to the office of chamberlain, after a contest with Sir John Pirie. Sir W. Heygate had been in a declining state of health for some time; indeed, about six months after his appointment to the lucrative situation, fears were entertained by his friends that he would not much longer survive the contest, which had evidently, by the anxieties it had created, prostrated his bodily strength. The intelligence of course caused a great deal of excitement amongst the friends of the several gentlemen who are expected to be candidates, among whom the following are already mentioned:—Aldermen Brown, Sir John Key, and Humphery, and Mr. D. W. Harvey, commissioner of city police.

Fire at the New Cross Station.—Yesterday morning, shortly before two o'clock, a destructive fire broke out in the extensive shedding of the Brighton and Dover Railway Companies at New Cross. Flames were first seen issuing from the centre of the building, which had a frontage of at least 200 feet, and a depth of 40 feet, by one of the railway police, who was on duty at the time. They spread with such rapidity that in half an hour the whole range, with its valuable contents, consisting of carriages completed, and others in an unfinished state, was completely burned down, and everything therein consumed. It is not known how the fire originated, and it is said that the companies are not insured.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending August 24th.—West Districts, 152; Northern, 180; Central, 179; Eastern, 194; Southern 231; Total, 936. Weekly average for the last five years, 946.

Provincial News.

Aylesbury.—The *Aylesbury News* mentions the death on the 3d inst., at Lower Clapham, near London, of Mr. Jacob Clements, who attained the age of 85, and presented through life a singular instance of good fortune. His first start in life was an engagement at the King's Head Inn, in this town, as potboy and errand-lad. Here, by his industry and perseverance, he soon became a favourite, and shortly saved 15*l.*, with which he started to London, to seek his fortune. In town he obtained a situation as waiter at an hotel frequented by stock-brokers; from servant he soon became the master and owner of the house; from landlord he became banker, and from Bank went upon 'Change, returning, it is said, the enormous amount of one million in a week, and eventually realising a fortune of 300,000*l.* Mr. Clement was not, however, regardless of the poor of his native town, and has for many years distributed an annual gift of bread and coals at Christmas, to the indigent families of the town, in addition to which a pound's worth of silver was regularly sent to be distributed amongst the poor recipients of the holy sacrament at the parish church. He was also a benefactor and annual subscriber to the county Infirmary.

Bristol.—The local papers state that Mr. Brunel had a lengthened interview with the dock-directors last week, for the purpose of presenting plans and sections of the proposed repairs and enlargement of the lock at Cumberland Basin. Mr. Brunel stated to the board that, having conferred with several contractors, he was enabled to declare confidently that the lock could be extended to 54 feet in width, at a cost not exceeding his previous estimate. Mr. Brunel was requested to prepare some further estimates as to the cost of repairing the lock in its present form and dimensions, and it was understood that the dock proprietary would be called together to consider the subject in a few weeks.

Bury.—Within the last few days Capt. Goate, R.N., C.B., committed suicide at his apartments in the Assembly-rooms, in this town, of which establishment he was one of the directors. From the facts adduced at the inquest it appears that for some time past he was in a desponding state, arising from his infirm condition and advanced age, being in his 70th year. More recently he underwent great suffering from an inflammation in his eyes, and although it had been removed still his vision was so much affected as to render him incapable of reading. On Saturday he was found drowned in a water cistern. The Jury returned a verdict "That he destroyed himself whilst in great distress of mind from fear of losing his sight, but whether in an unaccountable state there was no evidence to show." The deceased was the last male representative of the ancient name of Goate, in Suffolk. He was a Lieutenant in the Orpheus at the capture of the French frigate La Daquay Tronin, in 1794, assisted at the taking of Molacca, &c. in 1795, and was actively employed in the Elbe and Weser, in 1809.

Carmarthen.—Extensive preparations are making in this town to give a grand banquet to General Sir William Nott, who has addressed the following letter to the mayor of that town, accepting the invitation:—"I have been favoured with your letter of the 13th inst., transmitting the resolutions entered into at a public meeting of the inhabitants of Carmarthen, for the purpose of doing me honour upon my return to the never-forgotten scenes of my youth. I can assure you that I feel sincere gratification and pride at the flattering manner in which my old fellow-townsmen have come forward to welcome me upon my again revisiting my native land. I regret to say that the lamentable state of my health renders it impossible for me at present to name the day of my return to Carmarthen, but the moment I can get the permission of my medical attendant, I purpose leaving London, and I shall not fail to give you timely information of the day upon which I hope to enter Carmarthen."

Chard.—The small village of Winsham, near this town, has been the scene of two extensive fires, which have destroyed no less than 30 houses. The first broke out on Sunday morning, during divine service, in the upper part of a house situate, with 12 others, at the extremity of the village, and all having thatched roofs. There were no engines in the neighbourhood, and the whole of the buildings were consumed. A second outbreak, far more destructive than the previous one, took place on Monday night, in a small out-house in Church-street, and the wind being high at the time, upwards of 14 houses were destroyed. The distress that prevailed amongst the poor villagers was extreme. Six other houses, tenanted by small trades-people, were burnt with the rest, and it was feared at one period that the whole village would have fallen a prey to the flames; but the buildings being deprived of their thatch, they were thereby preserved. It is supposed that these fires were the work of an incendiary.

Gloucester.—The Bishop of Gloucester and Bristol commenced his triennial visitation on the 19th inst. His lordship's charge alluded to a variety of subjects in connexion with the church and the condition of his diocese. In regard to Tractarianism, the bishop said, "Having three years ago deemed it my duty to declare my condemnation of certain recent publications coming from the reputed leaders of a section in the church, I have now to state that my sentiments have undergone no change whatever since. On the contrary, everything has tended to confirm my opinion that the tendency of those writings is to Romanism. It is painful to my feelings now, as on a former occasion, to have to utter a remark which I know will give some clergymen pain, for whose worth and character I have a sincere esteem; but, whatever my real sentiments are, such and such only must I declare. It would be of little value to you to come and meet your diocesan and listen to his counsel, unless that counsel was the offspring of his own unbiassed judgment and mature conviction. The party that public opinion considers the leaders of the movement, I am far from thinking deserve the unqualified censure which has been heaped on them; neither do I deny that the church owes them an obligation. It is much to be wished that every one of their opinions was considered on its own merits, and that the general adoption of such parts as are consistent with the precepts and practice of the Reformers would take place, for it would do more to put an end to strife, and dissension, and ill-feeling, than all the denunciations we hear in such abundance. The rapid advance of such a party as I am referring to seems the consequence of a tendency natural to man to run, under such circumstances as I am speaking of, into the opposite extreme." After a short account of the rise of the schism, his Lordship proceeded to say:—"As to ceremonies, I cannot do better than recommend you to attentively peruse the preface to the Prayer-book. It is so fraught with a Christian spirit that it can hardly fail to procure the assent of all candid minds, to whatever party they may incline. What may be the result of the movement which has existed in the church for 10 years, it would be presumptuous in me to attempt to foretell; but my own anticipation is favourable, and I venture to hope that the same kind Providence which has hitherto watched over and protected the church, will continue to do so unto the end. I cannot for a moment entertain the idea that Popery will ever be dominant again in this country. I believe that no country that once threw off the yoke ever submitted to it again; and it is not probable that this enlightened nation, on which Heaven continues to lavish its bounties, physical as well as intellectual, will embrace those long discarded superstitions. The periodical publication from which I used to receive my information as to the sentiments and movements of the party is abandoned and defunct, and some of the most learned and respectable of the party have publicly renounced and withdrawn from the association. There may still be some who continue their zeal for Romanism, and who display their skill in balancing themselves so nicely on the edge as to prevent them from plunging into the abyss below. But this may be explained on a well-known and universally felt principle—the love of distinction, to the influence of which, although perhaps unknown to themselves, the conduct of the parties to whom I am referring may be attributed."

Isle of Wight.—The local papers state that the petition and remonstrances of the inhabitants against the desecration of Carisbrook Castle has had its effect on government, who have consented to become the purchasers of the surrounding meadows and plantations, thereby saving this beautiful scenery from the hand of the builder. There is little doubt that the property would have realised good prices, as speculators from all parts of the kingdom had been to view the place.

Newcastle.—On Friday Mark Sherwood underwent the extreme penalty of the law for the murder of his wife, on a drop erected on the Town-moor, within the circle of the racecourse. Since the trial he had been very attentive to the instructions of the chaplain, to whom he had made a full confession of his guilt.

Newcastle-upon-Tyne.—The foundation stone of the monument to be erected on Pensher Hill, in the county of Durham, to the memory of the late Earl of Durham, was laid by the Earl of Zetland with masonic honours, on Wednesday, amidst an immense concourse of spectators assembled from all parts of the adjoining district. The ceremonies usual on such occasions having been completed, the Rev. R. Green, of Newcastle, Provincial Grand Chaplain, offered up an appropriate prayer, which closed the proceedings of the day.

Plymouth.—The Stromboli steam-sloop is fitting with all possible despatch, at this port, for the purpose of taking out shot and shells to Gibraltar, for the use of the Mediterranean squadron. The first-class steam-frigate Terrible, building at Deptford, has had 200 additional workmen put on her, and is ordered to be ready for launching in November. Fifty old pensioners have been discharged from the San Josef, and 50 able seamen entered in their room. This has been the case also at the other guard-ships in the seaports, and 100 able seamen have been ordered to be entered as riggers at each of the several dockyards. The Admiralty have issued orders to build, by contract, two second-rate iron steam-frigates—one to work with paddle-wheels and the other with a screw propeller. They are each to be 203 feet in length, 37 feet in breadth, about 1300 tons burden, and 500 horse-power.

Portsmouth.—Prince Albert passed through this part on Thursday on a visit to Her Majesty's Marine villa in the Isle of Wight. His Royal Highness embarked in the Black Eagle steam-ship, under the usual salutes from the Victory and batteries, and proceeded at once to Cowes. The Black Eagle, by desire, passed close under the stern of the Collingwood, 80, at Spithead, with the flag of Rear Admiral Sir G. F. Seymour, which displayed the Royal standard, and fired a Royal salute while the crew manned the yards and gave three cheers. The yacht then pursued her voyage, and very soon reached the island. The object of the Prince's visit, to inspect the necessary arrangements making for Her Majesty's residence during the contemplated marine excursion, was soon accomplished, for at three p.m. the Black Eagle was seen on her return from Cowes, approaching Spithead, steering for the Collingwood. The yacht brought to close to the ship, and the Admiral's barge was put in requisition to convey his Royal Highness on board this splendid man-of-war. The Prince was received by Admiral Sir G. F. Seymour, Captain Smart, Commander Broadhead, and all the officers of the ship, with a distinguished party of ladies and gentlemen who were on board at the time, among whom were the Earl and Countess of Haddington, Lady Seymour, Lord Wharncliffe, &c. The Marines were drawn up as a guard of honour, and the sailors manned the yards; and when Prince Albert's flag, which had been struck in the Black Eagle on the Prince quitting her, had been hoisted in the barge, and thence run up at the main-royal-mast-head of the Collingwood, she fired a salute of 21 guns. His Royal Highness and suite remained on board the Collingwood nearly an hour, during which the Prince was conducted over the ship by the Admiral, the general appearance of which must have been most gratifying to his Royal Highness, as never since England had a navy could she boast of a more complete man-of-war.

Sheerness.—Captain Peter Fisher, Superintendent of this Dockyard, whilst superintending the towing of the

Achille, 76, out of the basin on Wednesday, was struck with apoplexy; the gallant Officer was instantly conveyed to his residence in the Dockyard, where the best attendance was promptly at hand, but it was unavailing, and he died in a few hours.

Sheffield.—The Duke of Norfolk has promised, on the expiration of a few leases, to give up 50 acres of his land for a pleasure-ground, for the recreation of the people of Sheffield. In Birmingham the question has already been discussed in the town-council, and the great advantage and benefit of public parks unanimously affirmed. That body has opened a communication with Government, for the purpose of obtaining a grant towards providing public walks, which in Birmingham, with 220,000 inhabitants, are felt to be imperatively needed. While on this subject, we may mention that Messrs. Jones, Lloyd, and Co., the bankers, have subscribed 1000*l.* towards a new park at Manchester.

Winchester.—The presentation of colours to the 49th regiment, recently returned from China, took place on Tuesday, in the presence of a numerous body of spectators, who had congregated from all parts of the country to witness the imposing ceremony. The Bishop of Winchester addressed the men at some length, and at the conclusion of the address performed the ceremony of consecrating the colours. Lady Pakenham then presented the new colours to the ensigns, and in doing so said—"I feel much interested in the scene before me, and must beg to express the high importance I attach to the present solemnity. I consider the colours that I am about to present to the 49th as emblems of the past career of the regiment as well as earnests of their future success; they bear the names of many battles, extending from the Rocky Mountains of North America to the Great Wall of China; but I esteem it one of the greatest privileges of British arms that wherever they have been successful hitherto that success has been attended by the bright halo of Christianity spreading abroad where the darkness of Paganism formerly reigned. May I express a humble hope that such will be the case in China, and that the success of the 49th at Amoy may be the pledge of this happy result? Receive these colours and bear them forward as gallantly as you have already done, and may the Lord God, the God of Battles, give you the victory." Sir H. Pakenham and Lieut.-Col. Adams afterwards addressed the regiment. The new colours were then paraded in front of the regiment in the usual manner, after which the regiment marched past the general in slow and quick time. After the men were dismissed they all sat down to a substantial dinner provided for them by their officers, in a pavilion erected in the barrack-yard for the purpose. The officers subsequently entertained their visitors at a *dejeúner*, and on Wednesday gave a ball in honour of the event.

Stafford.—On Tuesday week the village of Little Madely was alarmed by the explosion of two boilers connected with the engine at the iron furnaces belonging to Mr. Firmstone, attended with fatal results to one of the firemen. Shortly before the accident an examination of the boilers had been made, and all was considered safe, when, from some unknown cause one of them exploded with a tremendous noise, and the second in a moment after. A large piece of iron, about 15 cwt., was seen to rise over the tall chimney, and fall in a field opposite, across the turnpike-road. Another piece, of an immense weight, travelled in a contrary direction, and fell in a field above a quarter of a mile distant, and was found as flat as a plane. A third huge piece, after apparently striking the earth several times in its course, fell in a plantation. A number of smaller pieces were distributed around in every direction. A quantity of bricks, displaced from about the boilers by the violence of the explosion, were hurled through the roofs of the cottages; others were thrown into an adjoining corn-field, to the great danger of setting the corn on fire, as the bricks were red-hot. One man was struck by the bricks and killed, and the jury returned a verdict of Accidental Death.

St. Asaph.—The Bishop of Sodor and Man, in consequence of the great age and infirmities of Dr. Carey, Bishop of St. Asaph, has undertaken the temporary duties of the diocese, and on Wednesday last confirmed 773 youths of both sexes at Oswestry Church.

Windsor.—An American Quaker, named Sholl, arrived in England a few weeks since, with a newly invented beehive, which he submitted to the notice of Her Majesty and Prince Albert. On that occasion he kept his hat on before the Queen, and called Her Majesty and the Prince "friends." On Saturday last he arrived at Windsor Castle, with five additional hives, beautifully constructed in the shape of castles, for his Royal Highness. They were afterwards taken to the Royal Apiary, at the dairy in the Home Park. Instructions were immediately forwarded by the Master of the Household to an apiarian of Old Windsor to supply his Royal Highness with five swarms of bees to stock the new hives with, a task which was satisfactorily accomplished before dark the same evening Several more additional hives are expected shortly.

York.—The general subscription fund for the approaching meeting of the British Association exceeds 900*l.* It is exclusively appropriated for covering the expenses in this city, where the annual meeting is to take place on the 26th of next month. Earl Fitzwilliam is a contributor of 100*l.*; and among the subscribers are the Archbishop of York, 50*l.*; Lords Zetland, Feversham, and Wenlock, and Sir J. F. B. Johnson, Bart., respectively 25*l.*; Viscount Morpeth, 20*l.*; the Bishop of Ripon, Lord Hotham, Hon. Stuart Wortley, M.P., Hon. O. Duncombe, M.P., Sir E. Vavasour, Bart., Sir W. B. Cooke, Bart., Sir T. De Legard, Bart., Sir G. Cayley, Bart., Sir J. H. Lowther, Bart., Mr. Yorke, M.P., Mr. Warburton, M.P., Mr. Lawson, M.P., and Mr. Broadley, M.P., each 10*l.*

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 3107*l.*; Bristol and Gloucester, 1138*l.*; Eastern Counties, 4378*l.*; Edinburgh and Glasgow, 2739*l.*; Great Western, 17,837*l.*; Grand Junction, 10,223*l.*; Glasgow, Paisley, and Ayr, 1689*l.*; Great North of England, 1978*l.*; London and Birmingham, 19,228*l.*; South Western, 7419*l.*; Blackwall, 1263*l.*; Greenwich, 808*l.*; Brighton, 5578*l.*; Croydon, 622*l.*; Liverpool and Manchester, 5912*l.*; Manchester, Leeds, and Hull, associated, 8705*l.*; Midland, 11,140*l.*; Manchester and Birmingham, 3531*l.*; Newcastle and Carlisle, 2157*l.*; Newcastle and Darlington, 914*l.*; South-Eastern and Dover, 6483*l.*; Sheffield and Manchester, 814*l.*; York and North Midland, with Leeds and Selby, 3052*l.*—Notice has been given by the Board of Trade, that the Railway Department of the Board, consisting of Lord Dalhousie, Gen. Pasley, Mr. D. O'Brien, Mr. G. R. Porter, and Mr. Laing, intend to examine into the following schemes, with a view to the presentation to Parliament of minutes or reports thereon, in the event of their becoming the subjects of application to Parliament:—I. The schemes proposed for connecting London and York by a new line or lines of railway communication to the eastward of the lines at present existing. II. The schemes proposed for establishing east and west lines of railway communication between Lincolnshire and the West Riding of Yorkshire. III. The schemes proposed for completing the railway communication between Scotland and England. IV. The schemes proposed for extending railway communications to Newbury, and to the districts of Wiltshire, Somersetshire, and Dorsetshire, which lie intermediate between the London and South Western Railway, and the Great Western and Bristol and Exeter Railways. V. The schemes proposed for completing the line of southern coast communication between Chichester and Portsmouth. VI. The schemes proposed for extending railway communications from London to Gravesend, Chatham, and North Kent. VII. The schemes proposed for extending railway communications from Oxford to Rugby, and to Evesham, Worcester, and other districts intermediate between the Great Western and London and Birmingham railways. VIII. The schemes proposed for establishing new and more direct railway communication between Manchester and Leeds, Huddersfield, Halifax, Bradford, and other places in the districts adjoining to the Manchester and Leeds Railway, and intermediate between that line and the Manchester and Sheffield and Leeds and Bradford railways. The principal points into which inquiry will be made, in connection with the above schemes, are as follows:—1st. The ability and *bonâ fide* intention of the promoters to prosecute their application to Parliament next session for bills to authorise the several undertakings. 2d. The advantages to be obtained, in a national point of view, in completing or extending important lines of railway communication. 3d. The amount of local advantage afforded to the towns and districts more immediately affected. 4th. The engineering circumstances of the line, so far as may be necessary to form a general judgment of the character of the undertaking. 5th. The estimates of cost of construction, and of traffic and working expenses, so far as may be necessary to judge of the probability of the line being completed and efficiently worked in the event of its being sanctioned by Parliament, and with a view to drawing a comparison between the merits of competing lines of railway. The inquiry, in conformity with the recommendation of the Fifth Report of the Select Committee on Railways, will not embrace questions of private property or interest, which will be reserved altogether for the consideration of the Legislature.—The meeting of the South Western Company took place on Friday. The report stated that the receipts during the first six months of 1843 were 142,973*l.* 10*s.* 3*d.*, while those for the same months of 1844 amounted to 150,469*l.* 4*s.* 8*d.*, exhibiting an increase of 7495*l.* 14*s.* 5*d.* The expenditure during the latter period was 84,076*l.* 16*s.* 5*d.*; the amount available for division was 75,174*l.* 0*s.* 2*d.*, out of which the directors recommended the payment of a dividend greater by 2*s.* 6*d.* a share than that paid in September last, making the present dividend at the rate of 32*s.* 6*d.* a share. This dividend would absorb 74,607*l.*, and a balance would consequently be left of 567*l.* 0*s.* 2*d.* which would be carried to the next account. A reduction in the charge for goods had been effected to the extent of twenty per cent. The directors in alluding to the Epsom branch, expressed their conviction that the Croydon Company's proposal had been sanctioned by the House of Commons solely on account of the intention of the promoters of the branch to try the principle of the atmospheric traction on their line. The directors would renew their application to Parliament next session, for a branch line to Newbury, and for powers to construct a branch from Fareham to Portsmouth and Chichester. Instructions had already been given to Mr. Locke to survey the county for a line to Dorchester and Weymouth, and at a future meeting the intentions of the directors would be stated. The directors intended also to facilitate to the utmost of their power the formation of a railway from Richmond, to terminate at Waterloo-bridge. The report was unanimously adopted. The chairman in the course of his address in moving the adoption of the report stated that it was their intention to establish Wheatstone and Cooke's electric telegraph on their line to Portsmouth, Government having agreed to pay 1500*l.* a year towards its maintenance for 21 years.—The Birmingham and Glo'ster Company held a meeting on Friday. The report stated that the receipts for the half-year had been 53,203*l.*, expenditure 39,261*l.*, leaving a balance of 13,942*l.* applicable to a dividend of 25*s.* per share. The receipts from the passenger traffic showed an increase of 1590*l.* over the corresponding half-year, although no advantage had been obtained prior to the opening of the Bristol line on the 8th July last. The best understanding existed between the directors of the Bristol and Gloucester Company, who were cordially acting together. The opening of the Bristol line had considerably augmented the passenger traffic, though it had been reduced by the coaches put on between Worcester and Oxford; but it was hoped that the reduction anticipated in the fares of the London and Birmingham would restore the traffic to its former channel. The increase in the goods had been greater than in the passenger traffic, owing, it was conceived, to the company becoming their own carriers, and the facilities for increasing the merchandise traffic by laying down a line of rails to the Gloucester Docks. A saving under new arrangements would henceforth be effected in the maintenance of the permanent way, to the extent of 3500*l.* per annum. The expenses of the locomotive department had also been greatly economised, and the directors had under their consideration a scheme for a line to Worcester. They had also a line in contemplation between Bromsgrove and Stourbridge, which would open to the main line a populous and richly mineral district. The report was adopted without opposition.—At the meeting of the Great North of England Company the dividend declared was 1*l.* 12*s.* 6*d.* per share free of income-tax, leaving of the disposable balance of 15,957*l.* 19*s.* 4*d.* the reserve of 5086*l.* 14*s.* 4*d.* The net receipts of the half-year were 36,189*l.* 9*s.*, which showed an increase of 3109*l.* 1*s.* 4*d.* over the corresponding period of last year. The increase had generally been in merchandise and coal traffic. The coal trade would have been much more favourable had it not been for the pitmen's strike.—At the meeting of the Sheffield and Rotherham Company a dividend of 4½ per cent. was declared, but not without some severe observations upon the expenses of management. Although the concern is working at a profit, it seems that the expectations held out have deceived some of the proprietors, who profess to watch with some concern the progress of affairs.—The Glasgow and Ayr Company at their meeting announced a dividend of 1*l.* 2*s.* 6*d.* per share, in consequence of the increase of traffic. The sum of 585*l.* has been invested as an addition to the depreciation and contingent fund invested in the quarter shares of the company, which now amounts to 6914*l.* 10,000*l.* has also been paid as a deposit to assist in constructing the Dumfries and Carlisle Railway, which the company support in preference to the Caledonian line.—The Bristol and Exeter Company last week declared a dividend of 1*l.* 8*s.* per share, and the traffic is improving. A very high compliment was paid to the secretary, Mr. Badham, who is said to have raised the company from a state of insolvency to its present condition. This line is one of the very few finished before the stipulated period, and within the estimates named.—The London and Croydon Company have authorised their directors to purchase the newly-projected railway from Croydon to Epsom. The report stated that for the construction of the line to Epsom, on the atmospheric principle, a sum of 200,000*l.* will be required. A further sum of 130,000*l.* would be required to carry the line to London-bridge. Several deficiencies had been discovered in the estimates for the works on the Croydon line, and in order to cover these, and obtain the above additional capital, the directors proposed to raise 400,000*l.*, by creating new shares to be granted to the original shareholders, which was agreed to. The Croydon and Epsom company on the same occasion empowered their directors to sell and transfer their railway to the Croydon Company.—The cheap excursion train on the London and Brighton Railway, on Sunday last, exceeded in magnitude all the other monster trains on this railway. No less than 78 carriages, containing 2123 passengers, left London-bridge in the morning, and after spending the day in Brighton, returned in the evening. In order, however, to avoid the inconvenience experienced on former occasions from the delay in providing so large a number of passengers with accommodation, the train was divided into three portions, each of which was despatched as soon as full. The arrangements of this line, and of the steamers to Dieppe, have already brought Paris within 20 hours of London. The Baron de Lagos, charged with despatches from the Spanish Ambassador in London to the Ambassador in Paris, left London on Saturday morning and travelled by the Brighton Railway, then across to Dieppe, and through Rouen to Paris, performing the distance from London to Paris in 20 hours, including stoppages for refreshments, &c.—On Wednesday week as the first down-train on the Eastern Counties Railway was passing through a cutting of about five feet in the parish of Rivenhall, half a mile from the Witham station, a spark from the engine set fire to a field of barley belonging to Mr. Upson. The barley was very ripe and uncut, and a heavy crop both of straw and grain, not less than seven quarters per acre. The flames passed across the field with great rapidity, till they were stopped by the hedge or the bottom of the inclosure, which fortunately was a distance of only 18 rods. The quantity consumed was about two acres, and altogether, including the straw, the damage sustained is not less than 30*l.* The straw was entirely consumed. The field was in a blaze of fire before the train was out of sight.

IRELAND.

Dublin.—It is stated in various quarters that the long-looked-for visit of Her Majesty to Ireland will certainly take place during the present autumn, and that the first week in October is actually named for this excursion. It is also said that, in the event of the judgment against Mr. O'Connell and the other state prisoners being affirmed by the House of Lords, an act of Royal grace in their favour is contemplated, and that the remaining term of their imprisonment will be remitted. This announcement has caused great excitement, and no other topic is spoken of but Her Majesty's visit. The Conservative journals treat the supposition of Her Majesty unbarring the prison doors to Mr. O'Connell as one almost too monstrous for belief, whilst the opposite side profess to regard it as no favour at all, or one so insignificant that it could not stop the cry for Repeal even for a moment. The Repeal papers in their comments upon this report, have somewhat moderated their tone; at least, in comparison with the language used when a Royal visit was first bruited, unaccompanied by an act of amnesty. Indeed, the *Nation* says that, although not seeking a visit, they will not repel it. "As for the state prisoners," it says, "it is the Queen's undoubted prerogative to send them back to their labours for Ireland. If she does, they are ready to march from Richmond prison to Burgh-quay, and fall into their accustomed places like rested men bound to do double work. She will curtail their leisure, and anticipate by some months the time of their renewed labour—that is all. From them, as from every true man in Ireland, she will learn that it is no boon to terminate an injustice; and if it were, that all the favours it is England's to bestow or refuse, would not turn the Irish people from their solemn purpose." The Repeal party have had an additional cause for excitement in an address of condolence presented to Mr. O'Connell by Lords Shrewsbury, Camoys, Stourton, Dormer, Stafford, and Newburgh, and by most of the English Roman Catholic gentry, including the well-known names of Vavasour, Clifford, Mostyn, Maxwell, and Weld, of Lulworth. The Howard family, however, have taken no part in this demonstration. The address, among other topics, says—"We cannot but express our surprise and indignation that a sentence, procured under circumstances which must deprive it of any moral weight, should have been carried out with such indecent haste, when every principle of justice should have interposed to delay it till every doubt as to the legality of the verdict has ceased to exist. It is in vain, Sir, that the ordinary course of law is alleged in justification of the immediate execution of the sentence—that plea cannot avail unless it can be first shown that the prerogative of mercy has passed from Her Majesty's hand. An unworthy advantage of the defects of the law has been taken in your regard, and punishment has been visited upon you before it is known with certainty that the verdict under which it is inflicted will not be ultimately quashed."—The weekly meeting of the Repeal Association took place on Monday. Sir V. Blake, M.P., on taking the chair, took the opportunity of delivering a long address, wherein he stated his belief that the English people were well-disposed and sound-hearted, and would not allow Ireland to complain of injury and degradation, if they were at liberty to act in accordance with their feelings. He proceeded to take an elaborate view of the principal events of Irish and English history, commencing with the Clare election, passing on to the ravages of the Picts and Scots in England, whose practice of painting their bodies blue the hon. baronet thought accounted for the fondness manifested by their descendants for that colour, and concluded by the expression of his conviction that the "Polka" was nothing more than the "old original" Irish jig. Mr. Kelly, M.P., in the absence of Mr. S. O'Brien, handed in several sums of money, varying from 5*l.* to 20*l.* Mr. D. O'Connell handed in several sums of money, and then stated that the monster address to the Queen had been forwarded last week to Sir J. Graham, who had presented it to Her Majesty. General Clooney addressed the meeting. Mr. R. D. Browne, M.P., described the position in which the Repeal cause stood, and eulogised the means by which that position had been attained. It was to the new philosophy of moral agitation that their success was to be attributed. Their respect for the social relations of life, and strict observance of the laws, had drawn upon them the eyes of admiring Europe—had procured for them the sympathy of France, and the generous and inexhaustible aid of America. Circumstances were arising every day which gave them the highest hopes. The municipal declaration, signed by upwards of 500 members of the different municipalities, and headed by the Lord Mayor of Dublin, was a document which it would be impossible for him to over estimate. And the address to Mr. O'Connell, which had emanated from the Catholics of England, signed by a Shrewsbury, a Camoys, a Stourton, and a Vavasour, gave a new impulse to their cause. No moment could be more opportune for the people to struggle for the amelioration of their country than the present. Whether he looked to the east or to the west, he found embarrassments crowding upon England—from the Society Islands to the territory of Oregon, from Hindostan to Algiers. In every quarter of the world were visible the giant shadows of the coming revolution. Mr. Kelly, M.P., handed in 1*l.*, the monthly subscription of Mr. Smith O'Brien during the captivity; and then read a letter from that gentleman, in which he adverts chiefly to the suggestion that a system should be immediately organised for abstaining from the use of tobacco and other exciseable articles, and particularly from those of English growth or manufacture, as a certain means of affecting the revenue to such an extent that the Government will be compelled to grant Repeal. Mr. O'Brien says, "Though the conduct of the English Government towards the Irish people has been such as fully to justify this resolution, I am not prepared to ask the Repealers of Ireland to deprive themselves of any healthful enjoyment, unless some great national object can be promoted by such a sacrifice. It is right, however, that both Government and the people should contemplate such a determination as a probable contingency. So long as we are treated as 'aliens' and as enemies, no moral obligation binds us voluntarily to furnish the means by which our 'subjugation' (I borrow this word from the leading organ of public opinion in England) may be continued. The adoption, therefore, of this resolution, or non-adoption, is simply a question of expediency, and it is satisfactory to know that if a time shall arise when the imposition of personal privations upon ourselves will facilitate the recovery of our national legislation, those sacrifices will be cheerfully made." Mr. D. O'Connell then read his usual bulletin from the Penitentiary, and stated that his father and the other prisoners were in excellent health and spirits, cheered as they were by the obedience and perseverance of the Irish people. After some lengthy admonitions on the remissness of the Liberals in coming up to the registries, the bulletin, which is generally understood to be the exposition of Mr. O'Connell's feelings and opinions, concluded as follows:—He was happy to state that it was Mr. O'Connell's thorough conviction that the hour was coming for Repeal, and coming fast. The English Government would want, no one knew how soon, "the lion heart and stout hand of Ireland;" and they could have both by the simple process of doing justice to the Irish people. It would be foolish, to the last degree, of the Irish people to attend to idle rumours and newspaper reports. The Irish had but one resource, and that was in themselves—a resource that would be found quite available, when English statesmen were wise enough to perceive that Ireland ought to be conciliated. Let the people, then, continue their peaceable career of agitation. Let them not be turned aside by false hopes of any kind. Somebody has said—

"Hereditary bondsmen, know ye not,
Who would be free, themselves must strike the blow."

Whoever he was that used these words, if the Irish people continue true to themselves, active, but perfectly peaceable, the repeal would come as assuredly as to-morrow's sun. Mr. M'Nevin read a report from a committee of the Association, appointed to inquire into the opening of letters at the Post-office, and to consider the report of the Houses of Parliament on the same subject. Ireland had, he said, been specially favoured by the extensive use of that practice, and it could not but be a gratifying consideration for Mr. O'Connell, and those gentlemen who had partaken of Lord Normanby's hospitality, to know that at the instant they were sitting at his table their private affairs and their family secrets were as well known to his Lordship as to themselves. By the atrocious conduct of the Home Secretary, for imitating which the humbler subordinates of the Post-office were visited with condign punishment, had the soil of Italy been deluged with her noblest blood, and the gallant Bandieras had been led forth to an execution where Sir J. Graham might be considered as presiding in spirit, as he would have been its most suitable instrument in person. Several sums of money were handed in from various parts of Ireland, and the Rev. Mr. Coghlan denounced the Charitable Bequests Bill as an oppressive, bigoted measure, and enlarged upon the services of Mr. O'Connell, for whose speedy deliverance from his enemies a suitable prayer was offered up from the altar each Sabbath before mass, in nearly every chapel throughout Ireland. Mr. Kelly, M.P., in recommending the extension and establishment of Repeal reading-rooms, took occasion to direct the attention of the meeting to the present state of political affairs. Did they know that France had declared war against an ally of England, and had bombarded Tangier? (Loud cheering, and cries of "Bravo.") Her fleet was battering down the towns and forts of the Emperor of Morocco, the old friend of England, whilst the present force of that Power in the Mediterranean consisted of two vessels of war and an odd steamer or two. What a mighty fleet for Britannia, the great ruler of the waves! (Cheers and laughter.) Her ships, instead of guarding her interests, were busy on the coast of Ireland, keeping a bright look-out for any bit of green bunting which might chance to dangle from the mast of a passing merchantmen. (Cheers and much laughter.) Why, if they had a vocation for pulling down flags, did they not try their hands on the tri-colour of the Suffren? (Tremendous applause.) Town Councillor Reilly, in handing in 30*l.* from various districts, alluded to the rumoured advent of Her Majesty, which would, he said, be looked upon with joy, for she was a woman worth loyalty, for she was a Queen. He only wished she was coming to open her Parliament. But the people were not to relax in their exertions, nor suffer themselves to be led astray by cattle shows or Royal progresses. Prince Albert had sent a cow to their agricultural meeting. What a shame that was! Why, Sir R. Peel had sent a bull to Tamworth, but perhaps the Prince thought there were bulls enough in Ireland already. One thing he might be assured of, that no bulls or blunders would frustrate the speedy attainment of their sole and darling object—the Repeal of the Union. The Rent for the week was announced to be 634*l.* 13*s.* 11*d.*—The cow of his Royal Highness Prince Albert, which obtained the silver medal and prize of ten sovereigns at the late show at the Coburg Gardens, was four years old last January. She was of the blood of the late Mr. Bakewell, of Warwickshire. Her weight when living was 13 cwt. weight of carcase, 8 cwt. 3 qrs.; weight of tallow, 133 lbs.; height, 4 ft. 4 in.; length from head to tail, 6 ft. 6 in.; girth, 7 ft. 6 in.; breadth over loins, 2 ft. 4 in.; breadth of breast, 9 in. Prince Albert was pleased to present the prize of ten sovereigns, as also the price of the cow (50*l.*), to the Royal Agricultural Society, but retained the silver medal.

Athlone.—A melancholy accident occurred on Monday the 19th on Lough Red, near Athlone, to Captain Eliot, of the 4th Dragoons, stationed in that town, and to his servant, a fine lad, fourteen years of age. It appears that Capt. Eliot, accompanied by the Lieut. of his troop, with a man and his boy, proceeded down the river on a pleasure excursion to Shannon-bridge. In the evening, on their return, when they neared an island more than half way home, they agreed to sail on either side of it to see which would reach the Athlone end of it first: and in case one beat the other, he was to wait 15 minutes, and if he had not come up then, he was to proceed homeward. At this time the Lieutenant and his man were in one boat, and Captain Eliot and the boy in another. After waiting the time agreed upon, the Lieutenant proceeded to Athlone, when he found that neither the Captain nor his boat had arrived. Fearing an accident had occurred, he returned to the island, where he continued an unsuccessful search all night. On his arrival, Major Hodge, who commands the squadron at Athlone, got one of the large ordnance boats, manned with 15 men, and pushed off for the island. Having continued their search for some hours, they succeeded in finding the Captain's hat, and afterwards himself, standing in an upright position, and the boy beside him, each having hold of the other, and only about four yards from the shore. It is supposed, from the position in which they were found, that Captain Eliot lost his life in an effort to save the boy, as he was a most expert swimmer. He was the only son of a retired artillery officer, Colonel Eliot, of Valebrook-lodge, near Hastings, in Sussex, and has also left a mother and sister to lament his premature death. He joined the 4th as cornet at Brighton in 1835, and from that period enjoyed the closest intimacy and friendship with his brother officers, by whom he was greatly esteemed, and was only in his 29th year. The father of the servant boy was so affected by the loss of his son, that he died on the day after the accident. An inquest was held on the bodies of Captain Eliot and his servant, when the Jury returned a verdict of Accidental Death.

SCOTLAND.

Edinburgh.—The foundation-stone of a monument to the memory of Muir, and the other "political martyrs," was laid some days since, on the site selected within the Calton Hill Burying Ground, by Mr. Hume, M.P. It appears, however, that an unexpected opposition has been made to the erection of the monument, and that an application has been made to the Lord Ordinary, in the Bill Chamber, for an interdict. The judge (Lord Murray), however, refused to grant the interdict *hoc statu*, reserving to the parties to try the matter in the Court of Session, in a deliberate form.

Perth.—The accounts from the numerous sporting grounds in the county continue to represent the sport as unusually excellent, notwithstanding that the weather has not been, as a whole, for the past eight days, particularly propitious. The quantity of birds arriving at, and passing through this city, on their route to all points of the compass, is enormous, and almost beyond precedent.

Dundee.—A few days ago, a person named Maddeson was apprehended on the charge of misappropriating money, and of forging a certificate of character, just as he was about to commence his duties as Superintendent of Police at Dundee, and has since been committed to York gaol to take his trial at the next assizes.

Miscellaneous.

Dr. Wolff's Imprisonment in Bokhara.—Captain Grover has communicated to the daily papers some interesting particulars respecting Dr. Wolff, from which the following is an extract:—"The man sent to command the escort which was to protect him against the Turcomans turned out a great scoundrel, and the Doctor was obliged to appeal to the Turcomans for protection against his escort. Between them, however, the poor Doctor was plundered of everything, and on entering the city he was deserted by all excepting one man named Hussein, and he was looked upon as a man whose doom was sealed. When, however, the King ordered Nayeb to receive him into his house, the scene changed, and all predicted that danger was over. He was introduced to the King, kindly received, and he plainly told the object of his visit. The following day the King's chamberlain, accompanied by the commandant of the arsenal, ordered him to write in their presence the letter in which the King declares that he put Stoddart and Conolly to death in the month of July, 1843, and of this letter he had to make a translation in Persian. He was then told that he was free to depart. The letter having been despatched to Captain Grover, the Doctor received an intimation that he would be detained. Having a slight fever, he wished to be bled; this being communicated to the King, the permission was refused, the King saying that bleeding was not good for him. Dr. Wolff had recovered Colonel Stoddart's 'official seal.' The Doctor writes—'Pray for me, and thank God with me that He hath hitherto helped me.' At first he wore his clergy-

man's robes, and rode about the town unattended, which, he says, the Russian ambassador, who had just left, was not allowed to do. In another letter he says he has adopted the Bokhara dress, but does not say whether this was done by choice. On the 8th June he writes two lines to Colonel Sheil, in which he says, that in spite of all the promises of the King, he is now a prisoner at Bokhara, and that he has not the least hope of being soon released."

British Archæological Association.—A new Society under this title has been formed, for the purpose of encouraging the study and preservation of our national antiquities. The plan is to be that of the British Association, and the first meeting will take place on Monday week, the 9th Sept., at Canterbury, Lord A. Conyngham in the chair. On that day Lord A. Conyngham will deliver an address, whilst there will be an evening *conversazione*, in which a paper will be read on the Saxon barrows. Tuesday morning will be devoted to the opening of the barrows in the park of Lord A. Conyngham, at Bourne, and Thursday to excursions to Richborough and Barfreston Church to inspect the antiquities. The sections will be held on the intermediate days, and on Friday evening an Egyptian mummy will be unrolled.

Law.

Summer Assizes—Oxford Circuit, Gloucester.—*John Smith*, a man about 50 years of age, was charged with having forged the indorsement of Thomas Gardner, an attorney of Gloucester, to a bill of exchange drawn upon Thomas Wadley, of Maisemore, in this county, for the sum of 175*l.* Both parties being well known in this city and its vicinity, the case excited considerable interest, and the court during the investigation was densely crowded. The bill in question was made on the 6th January, 1842, and singularly enough, although the prosecutor disputed the bill in the month of March following, no steps were taken by him until the present time respecting the alleged forgery, notwithstanding that Smith all along maintained the genuineness of the document, and sued the acceptor upon it at the Gloucester assizes, when he recovered the amount from Wadley, who made no defence to the action. On that occasion the plaintiff's case was, that he had had many money transactions with the prisoner, who is a money lender and bill discounter, and that on the 6th January, 1842, a kind of arrangement was effected between them, on which occasion Smith made Gardner his debtor for 175*l.* 7*s.* 2*d.*, though Gardner denied that the balance against him was so large. However, he gave Smith a bill at two months, drawn entirely in his (Gardner's) handwriting, for the sum of 175*l.*, desiring him to get Wadley's acceptance to it. This was afterwards procured. Gardner did not indorse the bill, excusing himself from so doing upon the ground that while it was running Smith was not to attempt to negotiate it until they had arrived at a clear understanding respecting the outstanding account between them. According to Gardner's statement, Smith never furnished the requisite document. Notwithstanding the omission, however, upon the bill arriving at maturity, Smith sent it to his attorney, with Gardner's name affixed to it, instructing him, at the same time, to proceed against Gardner and Wadley for the amount, for which, as already stated, he obtained a verdict. On this occasion Gardner swore most positively that his indorsement was a forgery; and a great number of witnesses, well acquainted with his handwriting, stated that they did not believe the indorsement to be his. A man of the name of Luke Merchant was called to prove a very extraordinary conversation alleged to have taken place in the presence of numerous persons, at the Parrot Inn, in which the prisoner endeavoured openly to compel a person of the name of Cooper to undertake to swear that he saw Gardner write his name to the bill, which Cooper said at first that he could not do, but afterwards, on Smith's menacing him with transportation if he did not, he declared that "by God he would." Merchant added that he took down the whole of this dialogue upon a slate, as it proceeded, and copied it afterwards into a book. On cross-examination, it was elicited from him that he had wilfully introduced into his schedule, before the Insolvent Court, a fabricated statement as to the ownership of a house, and then swore that that was correct; though he added that this was done entirely at Smith's suggestion. The judge declared that the deposition of such a witness could not be received against any party. Gardner himself was subjected to a severe and searching cross-examination. The investigation of this case occupied the court for nine hours, and ended in an acquittal.

Central Criminal Court.—*Patrick Larkins*, a collector of letters at the General Post Office, was indicted for stealing, on the 12th August, two letters, containing several bills of exchange and orders for money to the amount of 750*l.*, the property of Her Majesty's Postmaster General. The letters which the prisoner was charged with stealing were sent from the Central Bank of Perth, to Messrs. Glyn and Co., bankers, Lombard-street, containing the amount of property described in the indictment, and they were never received by Messrs. Glyn. The prisoner was detected in the act of opening the letters. After the examination of several witnesses, Mr. Ballantyne said, he did not feel it to be his duty to struggle with this case. He could not shake the evidence against the prisoner. He had no instructions to contradict anything that had been stated, and consequently could not attempt any reasonable defence. He should therefore merely call a witness to prove the previous good character of the prisoner. One witness was called, who stated that he had known the prisoner for twenty years, and that he had always borne an excellent character. The jury immediately returned a verdict of Guilty. Mr. Baron Gurney then passed sentence. His lordship said the prisoner had been convicted on the clearest testimony of a most grave and serious offence. He was employed as a servant in the General Post Office, and it appeared that establishment never engaged any one whose character would not bear the strictest investigation. Previous character was required for the interest of the public, as a pledge for the honest performance of duty; but in this case, it had been dreadfully abused. Many poor creatures, said his lordship, (addressing the prisoner) who were placed at that bar, were not guilty of crimes of such magnitude as that on which you have been convicted, and therefore I feel it my duty to make a severe example. There is no reason whatever in your case to remit the utmost sentence of the law, and that is a punishment next to death. The sentence of the Court is, that you be transported beyond the seas for the term of your natural life.—*Octavius Clarke*, aged 28, a young man of respectable appearance, and the son of a late eminent divine, was indicted for stealing a gold watch, two gold rings, a coat, and other articles, value 20*l.*, the property of D. S. Leese; a gold watch, value 5*l.*, the property of Alexander Stewart; a mare, value 15*l.*, the property of George Smoothy; and also a number of less valuable articles, the property of divers persons residing in the city of London. On being called upon to plead, the prisoner, in a low tone of voice, said he was "Guilty." The Common Sergeant said, that the depredations of the prisoner had been of a wholesale nature, and had been carried on in a most systematic manner. Under all the circumstances, the Court was bound to make an example of him. The sentence was, that he be transported beyond the seas for the term of 10 years.—*Sackville Sackville*, alias *Davis*, aged 27, was indicted for feloniously forging and uttering a bill of exchange, for the payment of 260*l.*, with intent to defraud Simon Rendall. The prisoner, whose exterior presented a fashionable appearance, had been arraigned on a previous day and had pleaded "Not Guilty." Mr. Ballantine, who had been retained for the defence, rose and said, that the prisoner was anxious to withdraw his former plea, and by pleading guilty to throw himself upon the merciful consideration of the Court. Mr. Clarkson, on behalf of the prosecution, said he was instructed to recommend the prisoner to mercy. Mr. Baron Gurney, in passing the sentence of the Court, said, that on looking over the depositions which had been returned, he had found that it would have been impossible for the learned counsel for the prisoner to have contended against the evidence which those depositions disclosed. It was manifest that the prisoner had determined to live entirely by fraud and forgery, and had carried on his plans with the greatest impudence and effrontery, though in this instance the prisoner had not received the proceeds of the forgery in question;—no thanks to him. The effort had been made; and notwithstanding the recommendation to mercy made by the prosecutor, the Court could not do less than pass upon the prisoner a sentence of transportation for the term of twenty years. —*Pietro Valler*, jeweller, *Francisco Enrico*, fencing-master, and *Henry Harrison*, draper, were indicted for feloniously making certain orders for the payment of money, purporting to be orders of the Directors of the Administration-office of Funds in the kingdom of the Netherlands. The evidence in this case has been several times before the public at considerable length in the police reports within a short time. The details are simply these. Harrison called upon an artist named Rosenthal, who resides in the Waterloo-road, on the 16th July last, and after some introductory observations, engaged him to engrave and print off 350 fac-similes of a Netherlands coupon of the value of 2*l.* He agreed to pay 3*l.* 10*s.* for the work. Mr. Rosenthal, suspecting that all was not right, watched him, and saw him join the other two prisoners. The forged plate was to be prepared by the following Friday, but Mr. Rosenthal gave information, and proceeded with the work under cover of legal protection, and by the direction of the Consul-General of the Netherlands and the police authorities. When the coupons were ready, the prisoners Valler and Harrison called for them, and Valler took them away. A police-sergeant of the detective force followed, and traced them to an inn, where Enrico was waiting, and they were all taken into custody. The jury returned a verdict of Guilty against all the prisoners. Sentence, transportation for 10 years each.—Two young women, *Faith Bowerman* and *Sarah Hyland*, were convicted, the former of the manslaughter of her infant, by throwing it over a wall 10 feet high, immediately after its birth; and the latter of concealing the birth of her infant, the body of which was found in her box, with the head crushed, and a petticoat-string tied round its throat. Mr. Baron Gurney sentenced each of them to imprisonment, with hard labour, for the term of two years. —*Captain Jennings*, of the Acosta, who was indicted about six months since with M. Zulueta, on the charge of being concerned in the slave trade, but whose trial did not then come on in consequence of his not having been apprehended, having subsequently surrendered himself, was brought up for trial. It will be recollected that, on the former occasion, M. Zulueta was acquitted. Mr. Prendergast, on behalf of the prisoner, handed in a plea that he had already been tried at Sierra Leone and acquitted. Mr. Payne, for the prosecution, applied for a postponement until the next session, in order to give time to consider the plea. The principal witness (Captain Hill) had not yet returned from the coast of Africa. The Court granted the application, and the prisoner having renewed his bail, was allowed to stand out until the next session.—*Amelia Alfery* was indicted for feloniously attempting to murder, by drowning, her two children, Mary Sarah, otherwise Ann French, aged six years, and Henry William French, aged about four. The particulars of this case were given in this paper a few weeks back. It will be recollected that the poor woman had been cruelly treated and deserted by the father of the children, and that she attempted to drown herself and them in a pond at Wandsworth. She was rescued by her brother, a young lad, and the gardener of a gentleman at Wandsworth. For the defence it was argued that the unhappy young woman had lost her senses in consequence of the misconduct of the father, and it was evident, from her uniform kindness and affection to her children, that she was not in the possession of her faculties at the time she committed the act for which she had been indicted. Mr. Baron Gurney summed up the evidence, and expressed himself in terms of the greatest severity with regard to the heartless and unfeeling conduct of the man who had engaged the prisoner's affections, with whom she had lived for six years, and to whom she had borne those two children. He recommended the jury to acquit her on the ground of insanity, and she would then be taken proper care of. The jury returned a verdict of Not Guilty, she being of unsound mind. Mr. Baron Gurney then called up the little boy, William Alfery, and said that he had to commend him for his courageous conduct and great presence of mind in saving his sister's and the childrens' lives, but he was sorry to be obliged to add that he had not this day told all he knew, from an impression that his evidence would tell against his sister.

Police.—On Saturday the *Hon. W. R. Tuchet*, who has been so frequently remanded on the charge of shooting Mr. Smith, the gun-maker in Holborn, was brought up at Bow-street for his final examination. The prosecutor, an elderly gentleman, attended to give evidence; he still appeared very weak, and was, therefore, accommodated with a seat at the table. He then detailed the facts as they were given in this Paper at the time, and his statements were confirmed by the testimony of his son and the police-officer who apprehended the prisoner. The surgeon of St. Bartholomew's Hospital stated that on Saturday, the 6th July, he admitted Mr. Smith as an in-patient, with a pistol-shot wound immediately above the loins. Upon examining the wound with a probe, he found it passed downwards about two inches; at this depth he met with a resisting body, which he supposed to be either a bullet or a particle of bone. It was extracted on the 6th August (a month after admission to the hospital), and proved to be the bullet. The prosecutor had gone on favourably since its extraction; there was still part of the lumbar vertebræ which prevented the wound from healing, but no danger was now apprehended. Witness produced a small piece of bone, and a portion of the prosecutor's coat, which were taken from the wound. The prisoner, who looked about 25 years of age, and was perfectly composed during the examination of the witnesses, said nothing in his defence. The prosecutor and witnesses were then bound over to give evidence against the prisoner, who was remanded for a week, when he will be fully committed for trial. Since this examination, however, the affair has assumed a more serious character, in consequence of an aggravation of the symptoms in Mr. Smith's case. During the examination he appeared very weak, and gave his evidence with great pain. On his return home he became very ill, and was compelled to have medical aid. He continued to get worse, and on Monday was again received into St. Bartholomew's Hospital, where he now remains. The wound has broken out afresh, portions of bone are forced through it, and Mr. Smith still lies in a dangerous state.

BIRTHS.—15th inst., the lady of Rev. W. Wheeler, vicar of Old and New Shoreham, of a son—15th inst., at East Sutton-place, Kent, the lady of Sir E. Filmer, Bt., M.P., of a son—16th inst., at Dalston, Mrs. R. H. Shaw, of a son—16th inst., at Greenwich, Mrs. G. Shute, of a son—16th inst., at Walmer Lodge, the lady of J. Russell, Esq., of a son—17th inst., Lady Norreys, of a son—18th inst., at Brecon, the lady of M. P. Lloyd, Esq., of Glanseoin, Carmarthenshire, of a daughter—19th inst., in Lowndes-street, Belgrave-square, Lady Marian Alford, of a son—19th inst., at Chester-place, Hyde Park-square, the lady of J. J. Johnson, Esq., of a son.

MARRIAGES.—14th inst., at St. Martin's-in-the-Fields, C. F. Holmes, Esq., Capt. in the Army, to Anne A. Harding, second daughter of Mr. Harding, Braintree, Essex—14th inst., at St. Mary's Church, Bryanston-square, R. M. Nott, Esq., 64th Reg. Bengal Native Infantry, second surviving son of Major-General Sir W. Nott, G.C.B., to Emily M'Intosh, third daughter of the late J. M'Intosh, Esq., of 26, Upper Berkeley-street, Portman-square, and of Williamfield, Portobello, Scotland.

DEATHS.—18th inst., at Dogmersfield-park, after a short illness, L. Mildmay, the youngest daughter of the late Sir H. St. John Mildmay, Bart.—19th inst., at his residence, Forest gate, West Ham, in the county of Essex, G. Dames, Esq., aged 65—20th inst., at Edinburgh, Sir Neil Menzies, of Castle Menzies, Bart.—21st inst., at Margate, Henry Brooke, third son of the late S. Brooke, Esq., formerly of Finchley, Middlesex, aged 24—22d inst., at Chiswick, Middlesex, D. Rice, Esq., late of the City of Dublin—22d inst., at his house in Fenchurch-street, S. Tompsett, Esq., deeply regretted by his friends—22d inst., at Gosport, at the residence of her son, Eliz. M. Lowes, widow of the late J. Lowes, Esq., of Trinity-square, London—23d inst., at Blackheath Park, much respected, J. Kemp, Esq., aged 57—23d inst., at the house of her daughter, at Kensington, Kitty Ferard, relict of the late J. Ferard, Esq., of Kingsland Green, Surrey—23d inst., at Isleworth, at the house of her brother, the Rev. H. Glossop, Mrs. A. Bramwell, of 6, Harley-place, relict of G. Bramwell, Esq., aged 67—23d inst., at Bridgewater, J. Allen, Esq., aged 84—24th inst., George B. Burgess, last surviving son of the late W. Burgess, Esq., of St. John's, Southwark—24th inst., W. Heathcote, Esq., of Conduall Manor, Yorkshire, and Hythe, Southampton, aged 46—24th inst., J. Hagarty, Esq., United States Consul, at Liverpool, aged 54—24th inst., suddenly, Mr. Robert Griffith, of 14, Bennet's-hill, Doctor's Commons, aged 50—25th inst., at the house of Captain Dawson Mayne, near Shrewsbury, Edw. W. Mayne, third son of R. Mayne, Esq., aged one year and nine months—25th inst., at his residence at Brompton, B. Arthur, Esq., Captain in the 2d Somerset Regiment, aged 69—26th inst., Mr. J. Allman, jun., of Billinghurst, Nurseryman and Florist, much respected, aged 33—26th inst., at Sheperton cottages, Islington, Mr. C. J. Beton, son of the late C. Beton, Esq., formerly of Queen-street, Cheapside, aged 31—26th inst., at Clapham, Thomas Linton Bradley, youngest son of the Rev. C. Bradley, aged 4 years.

TO GARDENERS.

WANTED IMMEDIATELY, a married Man, between 30 and 40 years of age, without incumbrance, to convert and superintend the management of 23 acres, as a Market Farm. He must understand the Forcing as well as the Kitchen Departments thoroughly, and have an intimate and practical knowledge of the London markets. His character for honesty and sobriety must be unimpeachable.—Direct to G. M., Post-office, Guildford.

WANT PLACES.—All Letters to be post-paid.

AS HEAD GARDENER.—A Gentleman who is leaving his country residence, is desirous of obtaining a situation for his Gardener, whom he can confidently recommend. He has the charge of 45 acres of Land and the Stock, and his Wife has charge of the Laundry and Dairy. Has lived in highly respectable families. Most satisfactory testimonials and upwards of three years' character, with a recommendation of several years from former situations, can be given.—Direct to R. Smith, Gardener, Chelsham Lodge, near Croydon, Surrey.

AS GARDENER.—A Single Man, aged 30, who is perfectly acquainted with every branch of his profession, and for character and abilities, he can with the most perfect confidence refer to the following eminent gardeners, under whom he has acted as Foreman:—Mr. Kinghorn, Orleans house, Twickenham; Mr. Douglas, Auldenham Abbey, Watford; Mr. Ayres, Grove, Roehampton; and also to Mr. Marnock, Curator, Royal Botanic Gardens, Regent's-park. — Direct to J. D., 26, Munster-square, Regent's-park, London.

AS GARDENER.—A Single Man, aged 29, who is a native of Scotland, and perfectly understands his business; can have 6 years' character from the gentleman he is leaving.—Direct to W. D., Mr. Fuller, Nurseryman, Chertsey, Surrey.

AS GARDENER.—A Married Man, aged 30, who can have an excellent three years' character from his last place, wishes to engage with any nobleman or gentleman requiring the services of an experienced man in forcing Pines Vines, Melons, and Cucumbers, and in every other branch of his profession. — Direct to A. B., at Mr. Kernan's, Seedsman, 4, Great Russell-street, Covent-garden.

AS GARDENER.—A married Man, without incumbrance, a native of Scotland, aged 34; is well acquainted with the cultivation of Pines, Grapes, Melons, and Cucumbers, upon the most approved principles, and has had extensive practice in the Flower-forcing department, as well as a thorough knowledge of Flower and Kitchen Gardening. Highly respectable reference can be given as to character and ability.—Direct to A.M.G., at Mr. Glendinning's Nursery, Chiswick.

AS GARDENER.—A middle-aged married Man, who has had extensive practice in every department of gardening, is desirous of meeting with a situation in the above capacity, or as Gardener and Bailiff, and his wife to take charge of the dairy. He has lived seven years in his last situation, from which he will receive an excellent recommendation, and also from several of the best Gardeners in the neighbourhood of London.—Direct to G., care of Mr. Ayres, Brooklands, Blackheath Park.

AS GARDENER.—An active industrious Married man, aged 30, with one child, who perfectly understands the management of Hot and Greenhouses, Kitchen, Fruit, and Flower Garden, &c., and is both able and willing to work; and can get 3 years' trust-worthy character. No objection to a single hand place.—Direct to A. B., Mr. J. Pledger, Wood-st., Walthamstow.

AS GARDENER.—The advertiser, W. Hardie, has lived upwards of 5 years as General Gardener to J. Jarrett, Esq., of Cameston-court, near Bath, where he has had the charge of a first-rate general collection of Plants, &c., and will be disengaged in a few weeks, owing to alterations being made in the establishment. He will be most happy to engage with any nobleman or gentleman in want of such a servant.—Direct to him, at J. Jarrett's, Esq., Cameston-court, near Bath.

AS GARDENER, a Married Man, without incumbrance, aged 30, who has a thorough practical knowledge of Forcing, Kitchen and Flower-garden, &c.; is well acquainted with Plants and Flowers, and their proper treatment; also with the laying-out of the Flower-garden and Pleasure-ground, and planting them in the most approved style; can have an undeniable character from the gentleman whose service he has lately left. Direct to P. S., 19, Salem Gardens, Bayswater, London.

AS FLOWER-GARDENER, PLANTSMAN, or Gardener in general.—A Married Man, aged 28, with one child, who perfectly understands his profession, having been brought up in several private establishments, and can have nine years' unexceptionable character from his present employers. Direct to G. W., Chandler and Son's, Nurserymen, Vauxhall.

TO NOBLEMEN AND GENTLEMEN.

AS FARM-STEWARD or BAILIFF.—A Single Man who has been bred to Farming in one of the most improved districts in Scotland, and has also had much experience in England, in stock as well as arable husbandry. The advertiser is acquainted with the recent improvements, furrow-draining, &c., and can give the most unexceptionable references as to character and qualifications.—Direct to R. J., 8, Calder-row, Brixton-hill, London.

MIDHURST HORTICULTURAL SOCIETY.—The Seventh Annual Meeting of this Society will be held at the Grammar School, on Tuesday, the 17th instant, when Prizes will be given for Flowers, Fruits, and Vegetables,—the particulars of which may be had on application to Mr. JOHN THORP, jun., Secretary.

UNIVERSITY COLLEGE, London. — Junior School.—Under the Government of the Council of the College.—Head Master, THOMAS HEWITT KEY, A.M.

The SCHOOL will OPEN on TUESDAY, the 24th of SEPTEMBER. The session is divided in three terms, viz., from 24th September to Christmas, from Christmas to Easter, and from Easter to the 4th of August.

The yearly payment for each pupil is 15*l*., of which 5*l*. are paid in advance in each term. The hours of attendance are from a quarter-past nine to three-quarters past three. The afternoons of Wednesday and Saturday are devoted exclusively to drawing.

The subjects taught are reading, writing, the English, Latin, Greek, French, and German languages, Ancient and Modern History, Geography, both physical and political, Arithmetic and Book-keeping, the Elements of Mathematics and of Natural Philosophy, and Drawing.

Any pupil may omit Greek, or Greek and Latin, and devote his whole attention to the other branches of education.

There is a general examination of the pupils at the end of the session, and the prizes are then given.

The discipline of the school is maintained without corporal punishment.

A monthly report of the conduct of each pupil is sent to his parent or guardian.

Several of the masters receive boarders.

Further particulars may be obtained at the office of the College. CHAS. C. ATKINSON, Sec. to the Council.

The College Lectures in the Classes of the Faculty of Medicine commence on the 1st Oct., those of the Faculty of Arts on 15th Oct.—Aug. 27, 1844.

RAY SOCIETY, instituted 2d February, 1844.—This Society has been formed upon the principle of the Parker, Camden, Sydenham, and other Societies, for the purpose of securing to those attached to the study of Natural History, such Works on the various branches of Zoology and Botany as could not be obtained by other means; and will consist of original works; of new editions of works of established merit; of rare tracts and MSS.; and of translations and reprints of foreign works. Every subscriber of one guinea annually will be considered a member of the Society, and will be entitled to a copy of every work published by the Society. The Council have great pleasure in stating that the number of Members already exceeds 300, and beg to call the attention of their friends to the necessity of sending in their names as early as possible, in order that they may be enabled to determine the number of copies of their works which they ought to print. The Council hope to publish two volumes before Christmas, the first of which will consist of translations from the German and Italian, of Reports on the progress of Zoology and Botany during the last few years.

Communications on the business of the Society are requested to be addressed to the Secretaries, Dr. George Johnston, Berwick-upon-Tweed, and Dr. Lankester, Golden-square, London. Subscriptions to be sent, by post-office order or check, to the Treasurer, J. S. Bowerbank, Esq., 45, Park-street, Islington.

GEORGE JOHNSTONE, M.D.
EDWIN LANKESTER, M.D. } Secretaries.

NEW SUPERB SEEDLING CALCEOLARIAS.—The Subscribers respectfully intimate that they have got possession of the entire selected Stock of the above, raised by ISAAC ANDERSON, Esq., Maryfield, and for which the Silver Medal of the Royal Caledonian Horticultural Society was awarded to him at their Meeting of 17th May last, and which, at the subsequent Exhibition on the 6th June and 20th July, excited such general admiration; and that they have now published a DESCRIPTIVE CATALOGUE of them, which will be forwarded, post free, upon application; and as the stock of Plants is limited, early orders are requested. CARSTAIRS, KELLY, and Co., Florists, Warriston Lodge (opposite the Royal Botanic Gardens), Edinburgh. N.B. — Experienced GARDENERS, of good character, recommended.

THE FINEST DUTCH HYACINTHS and OTHER BULBS DIRECT FROM HAARLEM.

YOUELL AND CO. beg to inform their Friends and the Public they have just received their first Importation of the above in the finest possible condition, Catalogues of which can be had on application. They are enabled to offer "the finest Double or Single Blue, Red, White, and Yellow Hyacinths at 18*s*. per dozen."

Very fine ditto . . . . . 12*s*. per doz.
Fine ditto . . . . . 6*s*. „

And other Roots at equally moderate prices.

The Finest Norwich Black Baguet Tulips, 2*s*. each.

P.S.—Bulbs will be added as compensation for long carriage.

YOUELL AND CO. are now sending to any part of the United Kingdom the undermentioned highly-desirable Plants, full particulars of which will be found in their former Advertisements.

FUCHSIAS—per post free.

12 Extra Fine varieties, 12*s*., the Selection left to Youell & Co.
12 ditto ditto 21*s*., the Selection left to the Purchaser, *comprising most of the new varieties sent out this season.*
50 Fine varieties . . 40*s*., the Selection left to Youell & Co.
50 Extra Fine ditto . 60*s*., the Selection left to the Purchaser

VERBENAS—per post free.

12 Extra fine Varieties, 6*s*., the selection left to Youell & Co.
12 Ditto „ 10*s*., the selection left to the purchaser.

PANSIES. [Sent postage free.]

12 Fine Show Varietics, by name . . 10*s*. per dozen
12 Extra Fine ditto, do. . . 18*s*. „

Catalogues of which may be had on application.

CHRYSANTHEMUMS. (Sent postage free.)

Fifty of the newest best varieties by name, 12*s*. per dozen, for names and colours of which, see Advertisement of June 15th.

PETUNIAS—per post free.

Extra Fine Varieties, 12*s*. per doz., including Miller's Punctata.

PANSY "LADY ALICE PEEL" (for particulars of which see Advertisement of June 1, 1844), 3*s*. 6*d*. per plant.

ARAUCARIA IMBRICATA, in pots, 5 years old, 30*s*. per dozen, or 10*l*. per 100.

CEDRUS DEODARA, 3 ft. to 3 ft. 6 in., 10*s*. 6*d*. per plant.

N.B. All Orders above £2 are delivered carriage free to London or Hull, on plants added to compensate for the same.

☞ For Particulars of their EXTENSIVE COLLECTION OF CARNATIONS AND PICOTEES, see their Advertisement of last week.

Great Yarmouth Nursery, Sept. 5, 1844.

HOLLYHOCKS.

WM. JACKSON AND CO. beg to inform the admirers of these Noble Plants that their unrivalled Collection, comprising every variety and shade of colour, is now in splendid bloom.—Cross-lanes Nursery, near Bedale, Yorkshire, Sept. 3, 1844.

JAMES WALKER, FLORIST, &c., Rhodes, Middleton, near Manchester, Lancashire; begs to call the attention of Gentlemen and Amateurs to his choice collection of Geraniums, Catalogues of which may be had on pre-paid application.

1 Doz. of new and choice varieties £3 10 0
1 do. of good show . . . 1 1 0

Rhodes, Sept., 2, 1844.

GERANIUM "CELESTIAL."

CHANDLER AND SONS, NURSERYMEN, Vauxhall, London, have now ready to send out young plants of their New Geranium "CELESTIAL," which has been so much admired. The flowers being very large, and with a beautiful white throat, it is one of the most conspicuous varieties that has yet been raised. Plants, 10*s*. 6*d*. each.

C. and Sons have also to offer healthy young plants of CAMELLIAS of sorts, with flower-buds, at 30*s*. per dozen; larger plants 42*s*. per dozen; and good plants of the newer sorts 60*s*. per dozen. Also good plants of the best sorts of CHRYSANTHEMUMS, at 12*s*. per dozen; larger plants, 18*s*. per dozen. The package included in the above prices. A remittance or reference for payment in London will be expected from unknown correspondents.

DUTCH FLOWER ROOTS, &c.

JAMES DICKSON & SONS, 32, S. Hanover-street, Edinburgh, beg to intimate the arrival of their supply of DUTCH BULBS, consisting of all the esteemed varieties, in excellent condition, and respectfully solicit early orders, which shall meet with immediate and most careful attention.

At their Nurseries at Inverleith and Broughton Park, J. D. & S. have always a large stock of EVERGREEN and FLOWERING SHRUBS, FRUIT and FOREST TREES, seedling and transplanted, all of which are of excellent quality this season.

In the Floricultural department they can with confidence recommend their collection of GREENHOUSE, STOVE, and HERBACEOUS PLANTS, with choice assortment of FLORISTS' FLOWERS of every description, to which they respectfully invite the inspection of Amateurs.

Catalogues of every article to be had on application.

*** Experienced Overseers, Gardeners, and Foresters recommended.—Sept. 1844.

TO THE LOVERS AND AMATEURS OF ROSES.
WOODLANDS NURSERY, Maresfield, near Uckfield, Sussex.

WM. WOOD AND SON have the pleasure of announcing to their Friends that their newly-arranged CATALOGUE of ROSES is now ready, and may be had GRATIS on application. It will be found to contain all the newest and best varieties in cultivation.

W. W. and SON take this opportunity of informing Amateurs that their extensive collection of autumnal flowering Roses are now in splendid bloom. Admittance daily, Gratis (Sundays excepted).—Woodlands, Sept. 6.

AURICULA SEED from Stage Flowers, to be had in Packets at 2*s* 6*d*., of W. J. NUTTING, Seedsman, 46, Cheapside, London.

ROSES.

WOODLANDS NURSERY, Maresfield, Near Uckfield, Sussex.

W. WOOD & SON have the honour to announce that they are now issuing GRATIS, on application, their newly-arranged CATALOGUE OF ROSES, containing a full and comprehensive description of all the most popular varieties, in addition to the novelties that have appeared this season.—Woodlands, September 1.

JESSOP'S NURSERY, Cheltenham, Established in 1815, from its extensive connection, offers peculiar advantages to Noblemen and Gentlemen requiring Gardeners, Foresters, or Farm-bailiffs, of established skill and reputation. All communications promptly attended to.

INGA PULCHERRIMA. (Figured in "Paxton's Magazine of Botany" for August, 1844.)—Fine Plants of this extremely elegant and beautiful Exotic, with most of the other new and rare Plants of the season, may be obtained of the undersigned, at the following low prices:—

Inga pulcherrima, 7*s*. 6*d*.
Achimenes picta, 10*s*. 6*d*.
Æschynanthus Horsfieldii, 7*s* 6*d*
Amycia zygomeris, 7*s*. 6*d*.
Clerodendron splendens, 10*s*. 6*d*
„ squamatum, 5*s*.
Hindsia, or Rondeletia longiflora, 15*s*.
Epacris campanulata rosea (the finest selected from 1000 seedlings), 7*s*. 6*d*.
Habrothamnus elegans, 15*s*.
Tremandra Hugelii, 10*s*. 6*d*. to 21*s*.
Veronica speciosa, 5*s*. to 15*s*.
Erica elegans, fine and healthy, 15*s*., 24*s*., and 30*s*. per doz.
Drymonia punctata, 3*s*. 6*d*.
Phlox Van Houttei, (flowering plants), 2*s*.
Spirea Reevesiana, 5*s*.
Viburnum cotonifolium, 3*s*. 6*d*.

Also the following, in collections:

100 Cape Ericas of 100 distinct sorts, (including many fine sorts) 5*l*.
12 Epacrises of 12 distinct sorts, (including Campanulata rosea) 21*s*.
12 Azalea indica, of 12 distinct sorts, (including fulgens) 21*s*.

THOMAS JACKSON, Kingston Nursery, Surrey, Sept. 6.

MR. HOYLE'S NEW SEEDLING GERANIUMS.

WILLIAM MILLER respectfully announces to the Nobility, Gentry, Amateurs, and the Trade, that he has purchased the entire stock of the following superb SEEDLING GERANIUMS raised by G. W. HOYLE, Esq., of Guernsey, viz.:

1844—Titus	each—£3	3*s*.	0*d*.
Pompey		3	3	0
Champion		2	2	0
These three for six guineas.				
1843—Unique		1	1	0
Queen of England		1	1	0
Claude		1	1	0
Sarah Jane		1	1	0
Amelia		0	10	6
Majestica		0	10	6
Rosalia		0	10	6
Flora		0	10	6
General Pollock		0	10	6
These nine for five guineas.				

The entire set 10 guineas, with a discount of 20 per cent. to the Trade. A remittance must accompany the order from unknown correspondents.

Titus received a seedling prize at Chiswick, June, 1844; Pompey, Champion, and Unique were pronounced by Professor LINDLEY, in the *Gardeners' Chronicle* of June 29, 1844, to be "three flowers of good substance, size, and variety;" and Mr. Glenny, in *Gardeners' Gazette* June 22, 1844, says, speaking of the Geraniums at the Chiswick Fête—"Mr. Hoyle had by far the best lot there; Pompey was the best of them, and Titus next." Blooms of the others were likewise exhibited at the June Fête, Chiswick, 1844, and attracted very extraordinary attention, and were universally admired. On the whole, the above varieties, for substance, roundness of form, and general excellent qualities, are among the best ever offered to floriculturists. Printed Lists, with full descriptions, can be had on application. To commence sending out plants in October.

W. M. has been supplied by Mr. Hoyle with some choice GERANIUM SEED, which he saved from his own beautiful Seedlings, and the newest and best varieties sent out by other growers. Sealed packets of 100 seeds, 12*s*.; do. of 50 seeds, 7*s*. Also, Hybridised Seed, saved from his own extensive collection of Pelargoniums; packets of 100 seeds, 10*s*.; of 50 seeds, 6*s*.

Providence Nursery, Ramsgate.

TRUE HIGHLAND PINE.

JAMES GRIGOR, NURSERYMAN, Norwich, begs to call the attention of the Land Proprietors of England to this very desirable variety of Pinus sylvestris, which has been raised from seeds collected on the mountains of Strathspey, and of which he has strong plants ready to be sent out. For introducing this tree Messrs. GRIGOR, of Forres and Elgin, were awarded several premiums by the Highland and Agricultural Society of Scotland; and in that part of the country this Pine is rapidly superseding the common soft-wooded variety. For all economical purposes its chief merit consists in the hardness and durability of its wood; hence it is much sought after at present for railway sleepers. Pictorially considered, or as a landscape ornament, it rivals even the Cedar of Lebanon. Sir Walter Scott describes it as assuming much of "the bold and contorted figure of the Oak;" and in the last No. of the *Quarterly Review* it is recommended as a fit tree to be planted in churchyards and cemeteries.

Strong plants in pots, such as rabbits and hares will not destroy	6*d*. each.
Ditto, not in pots, 18 inches high	30*s*. per 1000.
Ditto „ 15 „	20*s*. „
Ditto „ 1 foot high	15*s*. „
Ditto „ 3 years old	10*s*. „

J. G. would recommend all who require them to furnish themselves immediately with these Pines, and to plant them forthwith. Spring planting is exceedingly hazardous; and when followed by such a season as was experienced during the commencement of the present summer, the young trees are sure to be killed.

Cedrus Deodara raised in the open ground, being the strongest plants yet offered in England, 10*s*. each. Araucaria imbricata, Pinus excelsa, Laricio, Austriaca, &c. &c. on reasonable terms.

CARNATIONS AND PICOTEES.

JOHN DICKSON, Acre-lane, Brixton, Surrey, has prepared for the growers of these splendid flowers a Catalogue, enabling them to judge of their qualities, with the prices annexed, which may be had at the Nursery, and of Messrs. WARNER & WARNER, Cornhill, London, after the 7th September.

TO CALCEOLARIA GROWERS.

THE present being a good time to sow CALCEOLARIA SEED, the Advertiser begs to offer a few packets of his splendid New Spotted kinds, saved with great care, with printed directions to raise the young plants, at 5s. per packet. —J. STANDISH, Nurseryman, Bagshot.

EARLIEST STRAWBERRY in CULTIVATION. —Strong Plants of the "PRINCESS ALICE MAUDE" STRAWBERRY, which has proved itself to be the earliest grown in this country, are now ready to be sent out at 30s. per 100. As an Early Strawberry, it has taken the First Prize at all the Horticultural Exhibitions in the early part of the season. Also Plants of the "British Queen," "Deptford Pine," "Prince Albert," and all the leading kinds. To be had of Messrs. WARNER & WARNER, Seedsmen, 28, Cornhill, London.

GEO. LIGHTBODY, Falkirk, respectfully informs the cultivators of the RANUNCULUS, that his CATALOGUE of SEEDLINGS is now ready, and may be had on application. A few Varieties of Superior New Seedlings will be let out this season. Gentlemen wishing Auricula and Ranunculus Seed, are requested to make early application, as but a small quantity has been saved this season. Packets 2s. 6d. each.

DOUBLE ROMAN and PAPER-WHITE NARCISSUS, 4s. per dozen. The above Bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have been just received at A. COBBETT's, late MR. BARRON's, Italian and Foreign Warehouse, 18, Pall Mall. Also Dutch Hyacinths, Crocus, Tulips, Anemones, &c. &c. Price Catalogues of which may be had per Post.

THE BEST CALCEOLARIAS OF THE SEASON, exhibited by Mr. KINGHORN, at the Chiswick Show, in May, and at the Botanical Society in June. N. GAINES, Surrey Lane, Battersea, having purchased the Stock of the following beautiful Calceolarias, intends letting them out in a few weeks, and as there will be but few plants, early orders are requested.

LADY ANN CHARTERIS.—"Nearly a round flower, richly mottled with bright-yellow and rich light and dark reddish-brown, nearly equal of each, full average size, shrubby habit, very handsome and effective as well as novel."

DUCHESS OF SUTHERLAND.—"The largest and best of its class, nearly as deep as it is across, richly blotched and speckled with dark-brown upon a gold-coloured ground, not equalled in form; shrubby habit."

PROFESSOR WILSON.—"Spotted like the leopard upon brilliant yellow ground, brighter and better than Lady Constable, and more inflated; a very distinct variety, and worthy of the very best collections."

KINGHORNII.—"A very distinct variety full of shaded elongated spots, or very short stripes, upon a dark-yellow ground; shrubby and rich in habit."

COUNTESS OF MORNINGTON.—Darker than the Duchess of Sutherland; good form and very distinct; shrubby habit, and handsome.

FLASH.—Brighter than any other grown; of good habit; very shrubby handsome plant.

The first four of these varieties were described by Mr. GLENNY in the *Gazette*, and were selected by him from the entire collection as the best, not less for their colours than their excellent form. They were also noticed in the *Chronicle*, as the best exhibited at the May Chiswick Show. The last two were not in flower at the time, but have been selected for their approximation to them in most of the particular points.

JOSEPH FRYER begs to offer to the notice of the public good Plants of the following:—Thunbergia alata superba, and Aurantica superba, 5s. each; Do. Fryeri, 1s. 6d.; Lisianthus nigricans, 5s.; Do. Russellianus, 1s. 6d.; Veronica speciosa, 3s. 6d. Finest varieties of Fuchsias sent out this year, 1s. 6d. each; last year's varieties, 9d. to 1s. Finest varieties of Pansies, 6s. to 12s. per dozen; New Seedling do., Standard, 5s. each. Pansy-seed just saved from J. F.'s extensive collection, 1s. to 2s. 6d. per packet.

The above will be sent by post free as far as practicable, and a remittance is respectfully solicited from unknown correspondents.—Clarendon Nursery, Camberwell, Sept. 6, 1844.

CAMELLIA "EMPEROR."

T. DAVIES AND Co. beg to inform their friends and the Public, that they now intend sending out the above magnificent Seedling, raised and flowered by them in 1843, when it was exhibited at the rooms of the Horticultural Society of London, where it was awarded a Prize, and afterwards spoken of by Dr. Lindley, in his Report of their Meeting, in the following terms, in the *Chronicle* of 25th March, 1843:—"MESSRS. DAVIES & Co., exhibited a very handsome Seedling Camellia, raised from the seed of C. colvillii, fertilised with the pollen of C. reticulata. In the foliage it resembles the older sorts, but the flower, which is large and well filled up, partakes of the form and colour of its male parent. A certificate was awarded for it." Price from 3l. 3s. to 4l. 4s. Stock positively very limited.

CEREUS GRANDIFLORUS RUBRA. This splendid new variety of Cereus was raised by T. D. & Co. in the manner described by Dr. Lindley in the Leading Article of last week's *Chronicle*. The flowers measure 10 inches in diameter, are of a pale-red colour, with a shade of purple in the centre. The expand about 7 o'clock in the evening, and last nearly the whole of the next day, being an advantage over the night-blooming, which generally close early the next morning. Strong plants are now ready for sending out at 10s. 6d. each. Reference or remittance required from unknown correspondents.—Wavertree Nursery, near Liverpool, 7th Sept., 1844.

DUTCH HYACINTHS.

WARNER AND WARNER, SEEDSMEN, No. 28, Cornhill, London, respectfully inform the Nobility and Gentry their Dutch Flower-roots have arrived in superior condition, consisting of the choicest and newest varieties. The Bulbs are unusually handsome and large, at moderate prices. Catalogues forwarded by post on application.

SMITH'S FIELD and GARDEN SEED-DIBBLE, or HAND-MACHINE, for depositing all kinds of Seed on the various Soils, with the greatest accuracy and despatch.—This Machine is so simple in its construction and operation as not to be liable to get out of order, and can be used by men or women. It is easily set, so as to deliver the exact quantity of Seed intended to be planted, into each hole made by the Dibble, at one operation, without any further care than supplying it with Seed, by the person using it, and will plant Turnip and Mangold Wurzel Seed, Wheat, Barley, Peas, and all kind of Garden Seeds. In Tin, 1l. 10s. each; or with Copper Box and Tube, 1l. 15s. each. Commission allowed to Agents.

These Dibbles may be obtained of Messrs. COTTAM and HALLEN, 2, Winsley-st., Oxford-st., London, through the agency of the principal Agricultural Implement Sellers in the United Kingdom; or from the Inventor, by letter, to his address, inclosing a Post-office order for the amount.—RICHARD SMITH, Upper Hall, near Droitwich, Worcestershire.

EXHIBITIONS AT THE GARDEN OF THE Horticultural Society of London, FOR THE YEAR 1845.

NOTICE IS HEREBY GIVEN that the following are the RULES to be observed at these Meetings:—

EXHIBITORS.—All Persons, whether Fellows of the Society or not, will be at liberty to send subjects for exhibition.

FLOWER-STANDS.—Exhibitors of Cut Flowers must SUPPLY THEIR OWN BOXES OR STANDS. No box or stand should exceed eight inches in height at the back, or 18 inches in depth from front to back. The lids of all boxes MUST either be loose or made to unhinge.

MEDALS AND REWARDS.—The Society distributes the following Medals and Rewards,—namely,

	value.—	£	s.	d.
C.	The Certificate	0	10	0
SB.	Silver Banksian Medal	1	0	0
SK.	Silver Knightian Do.	1	5	0
LS.	Large Silver Do.	1	15	0
SG.	Large Silver Gilt Do.	4	0	0
GB.	Gold Banksian Do.	7	0	0
GK.	Gold Knightian Do.	10	0	0
LG.	Large Gold Do.	20	0	0

Exhibitors to whom any of these shall be awarded can exchange them one for another, or may receive their value in money, or in plate. *If within one month after the third Exhibition of the year* no intimation shall have been received from an Exhibitor of the manner in which he desires his Medals to be disposed of, all the Medals due to him may be prepared and *transmitted to him through the usual public conveyances, without further notice.* In case an Exhibitor shall receive a First Prize in any one letter, he shall not be entitled to receive any other Medal in the same letter, except in *K K*, *M M*, and *N N*.

IT IS, HOWEVER, TO BE PARTICULARLY OBSERVED that if any Exhibitor shall obtain the award of a Medal, and it shall be afterwards ascertained that he has gained it by exhibiting plants not *bonâ fide* his own property, or that of his master, such award shall be cancelled, in favour of the Exhibitor next below him, whose Medal shall in like manner be transferred to the person immediately following him in the award, and so on.

SUBJECTS OF EXHIBITION.—These will be divided into Classes, as explained further on. No articles not of Horticultural produce will be allowed to be placed upon the tables. Exhibitors will do well to make themselves acquainted with the arrangements described in the following List, as they will in ALL CASES BE REQUIRED TO SIGN A PRINTED FORM OF DECLARATION TO BE FURNISHED TO THEM IN THE GARDEN, stating under what letter their plants are to be shown; and they are particularly requested to TAKE NOTICE, that if errors in the awards of the Judges should occur, in consequence of mistakes on the part of Exhibitors in filling up such Declarations, the Society cannot undertake to rectify the errors afterwards.

Names fairly written are to be attached by Exhibitors to all Florists' Flowers; and the Judges are restrained from awarding any Medal to such Exhibitions, whatever their merit may be, if this regulation is not complied with. By Florists' Flowers are meant not only flowers usually so named, but also Fuchsias, Pelargoniums, Roses, and Calceolarias. It is also hoped that all other subjects of Exhibition will be neatly and legibly labelled with their names.

CLASS I.—FLOWERS; for which Nurserymen and Private Growers exhibit independently of each other.

A. Pelargoniums; in collections of 12 new and first-rate varieties, cultivated with superior skill, in pots of 24 to a cast. GB—SG—LS.

B. Pelargoniums; in collections of 12 varieties, in pots of 24 to a cast. GB—SG—LS.

C. Pelargoniums; in collections of six varieties, in pots of 8 to a cast. LS—SK—SB.

D. Roses, in pots; Amateurs to show in collections of 12, Nurserymen in collections of 25, distinct vars. GB—SG—LS.

N.B. It is the wish of the Society, in a future season, to require Roses to be shown exclusively in pots, and not to allow cut specimens to be exhibited at all.

E. Roses in pots; single specimens displaying superior cultivation. SK—SB—C.

F. Moss Roses, in loose bunches, each consisting of three trusses as they are gathered, so as to exhibit, as far as possible, the habit of the variety; in 12 varieties. SK—SB—C.

G. Other Roses, exhibited as in the last letter, and in 50 varieties. LS—SK—SB.

N.B. No one who exhibits in this letter can also compete in the following.

H. Other Roses, exhibited as in the letter F, and in 25 varieties. SK—SB—C.

N.B. Higher Medals than those here offered for Roses cannot be given by the Judges. And if Roses are brought for exhibition without attention to the regulations here explained, they will not be allowed to compete.

I. Cape Heaths; in collections of 20 entirely distinct varieties. GK—SG—LS.

N.B. It is expected that the same plant shall not be exhibited on more than one occasion.

K. Cape Heaths; in collections of 12 entirely distinct varieties. GB—SG—LS.

L. Cape Heaths; in collections of 6 entirely distinct varieties. SG—LS—SK.

N.B. No person will be allowed to show in more than one of the classes *I*, *K*, and *L*.

M. Cape Heaths; single specimens displaying very superior cultivation. LS—SK—SB.

N. Calceolarias, in sixes; in pots of 24 to the cast. LS—SK—SB.

O. Carnations, in pans of 24 distinct varieties. LS—SK—SB.

P. Picotees, in pans of 24 distinct varieties. LS—SK—SB.

Q. Pinks, in pans of 24 distinct varieties. SK—SB.

R. Ranunculuses, excluding Turbans; in stands of 12 distinct varieties for Private Growers, and 24 for Nurserymen. LS—SK—SB.

CLASS II.—FLOWERS; for which all persons are admitted to equal competition.

S. Stove or Greenhouse Plants; in collections of 40 plants. LG—GK—GB.

N.B. Calceolarias, Fuchsias, Orchidaceæ, and Pelargoniums to be excluded from *S*, *T*, *V*, and *R*.

T. Stove or Greenhouse Plants; in collections of 20 plants. GK—GB—SG.

N.B. Exhibitors cannot show in more than one of the classes *S*, *T*, *V*, and *W*.

V. Stove or Greenhouse Plants; in collections of 12 plants. SG—LS—SK.

W. Stove or Greenhouse Plants; in collections of 6 distinct species. LS—SK—SB.

X. Greenhouse Azaleas; in 12 distinct varieties. GB—SG—LS.

Y. Greenhouse Azaleas; in 6 distinct varieties. SG—LS—SK.

N.B. No one can show in both classes of Azaleas.

Z. Stove or Greenhouse Climbers; in collections of 6 species. SG—SK—SB.

AA. Exotic Orchidaceæ; in collections of not fewer than 20 species. LG—GK—GB.

N.B. Exhibitors cannot show in more than one of the classes *AA*, *BB*, and *CC*.

BB. Exotic Orchidaceæ; in collections of 12 species. GK—GB—SG.

CC. Exotic Orchidaceæ; in collections of 6 species. GB—SG—LS.

DD. Scarlet Pelargoniums; in 6 distinct vars. LS—SK—SB.

EE. Pelargoniums; in 6 DISTINCT SPECIES. SG—LS—SK.

N.B. By the word species is meant the wild kinds imported from the Cape of Good Hope, or New Holland, tuberous species inclusive, and not garden crossbreds.

FF. Achimenes; in collections of 6 species, grown in pans not less than a foot in diameter. LS—SK—SB.

GG. Distinct varieties of Tall Cacti in flower. GB—SG—LS.

N.B. The GB and SG Medals are not to be given if fewer than six varieties are exhibited.

HH. Fuchsias; in collections of 12 VERY DISTINCT varieties, of which one-half shall have a light calyx. LS—SK—SB.

II. Cinerarias; in pots, in collections of 12 distinct varieties. SK—SB—C.

KK. New or extremely rare ornamental Plants. SG—LS—SK.

NB. These Medals will be awarded by the Society's Officers, and not by the usual Judges. Exhibitors will particularly observe that none but new or rare plants can be exhibited under this letter. *Nothing will be regarded as new which has been exhibited in the Garden in a previous season.*

LL. Single specimens of very superior cultivation. SG—LS—SK.

MM. Miscellaneous subjects. SK—SB—C.

N.B. Exhibitors under *MM* will not be thereby *entitled* to a pass-ticket. Cockscombs, Heartsease, Hydrangeas, and bouquets are altogether excluded from exhibition.

NN. Seedling Florists' Flowers. SK—SB—C.

N.B. Every seedling must be shown singly, and marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. Pelargoniums are to be shown in pots, and not in a cut state. No person will be allowed to exhibit more than 6 seedlings at each meeting. Exhibitors under this head will not be thereby *entitled* to a pass-ticket. For seedling Pelargoniums exhibited the first year no higher prize shall be given than a Certificate, and this is to be awarded to flowers of decided merit. Seedling Pelargoniums of the second year must be shown in pots not smaller than 32s, and each exhibitor may produce six of them, but not a larger number.

IN ADDITION to any Medals assigned to the classes *I*, *S*, *T*, and *AA*, the SK, SB, and C are offered for the collections in those classes which shall be best named by the Exhibitor.

N.B. The Society's Officers, who will make this award, will be guided in their judgment by a consideration not only of the correctness of the names, but of the accuracy of the spelling, and the neatness of the writing.

CLASS III.—FRUIT; for which Market Gardeners, Fruiterers, or persons in the habit of regularly supplying the Market, and Private Growers, exhibit independently of each other.

N.B. All Fruit must be FULLY RIPE and WELL-COLOURED and PROPERLY NAMED by the Exhibitor as far as practicable, if the contrary it will be disqualified.

OO. Miscellaneous Collections of Fruit, consisting of at least three different kinds, Peaches and Nectarines being considered as only one kind. GK—GB—LS.

N.B.—Cucumbers, Tomatoes, Gourds, and similar Kitchen Garden produce, are excluded from this letter.

PP. Grapes. SG—LS—SK—SB.

QQ. Pine Apples. SG—LS—SK—SB.

RR. Peaches or Nectarines, in dishes of six specimens. SK—SB.

SS. Other kinds of Fruit. SK—SB—C.

JUDGES.—The Judges have the power of *increasing* or *diminishing* the number and value of the Silver Medals offered by the Society for particular objects, and also of *conferring* Silver Medals or Certificates in cases not contemplated in these regulations, if they think it necessary to do so.

The Judges are also required to bear in mind that the Society's Medals are offered less for new and curious objects than for fine specimens of Horticultural skill, the design of the Council in instituting these meetings being not so much to encourage the Collector as to reward the skilful Gardener. They are also not to make any award in cases where the objects exhibited do not appear worthy of a Medal; otherwise a bad single exhibition might obtain a prize, merely because there is no better exhibition of the same class to oppose it.

By order of the Exhibition Committee, JOHN LINDLEY,
Aug. 31, 1844. Vice Secretary.

*** Copies of these Regulations can be procured upon application at the Society's Office, 21, Regent street.

TO GENTLEMEN, BUILDERS, NURSERYMEN, & OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed to Sell by Public Auction (under a bill of sale), on the premises, Sussex Nursery, Loughboro'-road, Brixton-road, on Monday, 30th September, 1844, at eleven o'clock, the whole of the NURSERY STOCK, consisting in choice Evergreens and Flowering Shrubs, Standard and Dwarf Roses; also two newly-erected Greenhouses, Frames, about 2000 Greenhouse Plants, a quantity of Rock Work, Utensils in Trade, &c.; may be viewed prior to the sale. Catalogues may be had on the premises, of the principal Seedsmen, and of the Auctioneers, Leytonstone.

NURSERY STOCK, KING'S ROAD, CHELSEA.

KIRKE respectfully begs to announce that he has received instructions to Sell by Auction, on the premises, (late The American Nursery) King's Road, Chelsea, on Wednesday, September 11th, at 11 for 12 o'clock, by order of the proprietor, the ground being required for other purposes, the Valuable Collection of CACTUSES, GERANIUMS, CAMELLIAS, ORANGE, LEMON, and CITRON TREES; ALOES, FUCHSIAS, YUCCAS, CHRYSANTHEMUMS, AZALEAS, and SUCCULENT PLANTS; the whole in pots, and arranged in small and large lots to suit the convenience of purchasers; GREENHOUSES, &c. &c.—May be viewed two days prior to sale. Catalogues had on the premises; of Messrs. DIXON and Co., Covent Garden; of Messrs. T. and C. LOCKHART, Seedsmen and Florists, Cheapside, City; and at the Offices of the Auctioneer, 23, Brompton-row, Brompton.

LYDDEN; FIVE MILES FROM DOVER.

FOR SALE BY PRIVATE CONTRACT.—Three Hundred and Four Acres of FREEHOLD, and One Hundred and Ninety-four Acres of LEASEHOLD LAND, together with the Rent-charge, in lieu of Rectorial Tithes, over the parish of Lydden.

The FREEHOLD comprises, with Farm Buildings—

	ac	rds	per
Cocklescomb Manor Farm (Arable Land)	109	3	4
Warren Farm (Arable, Pasture, and Woodland)	117	2	39
Kelly or Bell Farm (Arable and Pasture)	71	0	0
Cannon Land (Arable and Woodland)	5	1	38
Total	304	0	1

And Nine substantial Cottages and Gardens.

The LEASEHOLD consists of—All that capital Farm-House, Lydden Court, with ample Farm Buildings, in a good state of repair, and One Hundred and Ninety-four Acres, 1 Rood, of Arable, Pasture, and Woodland, with a Rent-charge in lieu of Rectorial Tithes, variable under the Act for the commutation of Tithes, together with a like Rent-charge over the remainder of the parish of 217l., subject to a like variation.

The Land is in a high state of cultivation. There are Sixteen Years unexpired of the Leasehold.

For Particulars, and to treat for the Purchase, apply to Mr. COLEMAN, Kearsney Court Farm, near Dover.

MR. LYNE'S NEW SEEDLING GERANIUMS.

WILLIAM E. RENDLE has much pleasure in offering to the Nobility, Amateurs, and Trade the following new varieties of GERANIUMS raised by P. E. Lyne, Esq., the entire stock of which he has succeeded in obtaining.

		£	s.
Lyne's Princess Alice	each	1	1
Lyne's White Perfection	,,	1	1
Lyne's Imogene	,,	1	1
Lyne's King of Saxony	,,	1	1
Lyne's Redworth	,,	1	1
Lyne's Confidance	,,	1	1
Lyne's Sappho	,,	1	1

The whole set as above for six guineas. The usual discount to the Trade.

"Princess Alice" has received two seedling prizes in London. "White Perfection," first prize at Torquay, and the Gold Medal at Plymouth. "Imogene" is described in the *Chronicle*, June 24th, 1843. They all possess most desirable properties, and can be highly recommended as being first rate flowers.

W. E. R. has been induced to offer the above at prices considerably lower than usually obtained for such valuable varieties, in hopes thereby to meet with a more extensive demand. Descriptions can be obtained on application.

Orders will be executed in strict precedence. Plants will be delivered in October next. Reference or remittance required from unknown correspondents. Plants will be added to compensate for carriage.—Union Road Nursery, Plymouth, Sept. 6.

The Gardeners' Chronicle.

SATURDAY, SEPT. 7, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

SATURDAY, Sept. 14 Royal Botanical . . . 4 P.M.
TUESDAY, Sept. 17 South London Floricultural . 1 P.M.
COUNTRY SHOW.—WEDNESDAY, Sept. 11 Tottenham . 2 P.M.

THE decision of the Horticultural Society as to the subjects for which medals are to be offered at the EXHIBITIONS IN THE GARDEN next year will be found in another column. It has been arrived at after a careful consideration of the subject, and of the suggestions of many persons taking an interest in those meetings.

The main differences between the present schedule of prizes and that of last season consist in the following particulars:—

Several new classes are introduced; viz., Roses in pots, Cape Heaths in 12s and as single specimens, Ranunculuses, Stove and Greenhouse plants in 12s, Orchidaceous plants in 12s, Scarlet Pelargoniums, Pelargoniums as species, and Achimenes.

The large collections of Stove and Greenhouse plants are made to contain more plants; but Heaths, Azaleas, Rhododendrons, and Cacti, are again admitted into them, it having been found by experience that gardeners cannot make up such collections without the assistance of those kinds of plants.

Medals of higher value than before are offered in some of the classes. The Large Gold is offered for the best large collection of Stove and Greenhouse plants; two Gold Banksian Medals are offered for Pelargoniums, instead of one; and the Gold Knightian is offered for Heaths, instead of the Gold Banksian. Upon the whole, the increase in the general value of the medals may be judged of from what has been done with respect to those of gold. In 1844 there were offered fourteen gold medals, of the value of 123*l.*, for each Meeting; in 1845 their number is nineteen, and their value 177*l.*

Rhododendrons in pots, single Orchidaceous plants, and plants in Ward's Cases, no longer make separate heads of exhibition.

The declaration as to whether plants have been previously exhibited, is not to be required in future.

A new regulation has been introduced in the following words: "If any exhibitor shall obtain the award of a medal, and it shall be afterwards ascertained that he has gained it by exhibiting plants not *bonâ fide* his own property or that of his master, such award shall be cancelled in favour of the exhibitor next below him, whose medal shall in like manner be transferred to the person immediately following him in the award, and so on." This has been rendered necessary by the system of borrowing plants for exhibition, which some persons are said to have practised elsewhere this year with considerable success—a practice most disgraceful to the parties concerned in it, and such as no man with a grain of honesty would be guilty of. Gardeners have now only to look sharp after such men, whose names are in our possession, and who are well known; and if their tricks pass current in the Garden of the Horticultural Society they will be more cunning than we take them to be.

WHEN we first proposed to Gardeners that they should turn their attention to the cultivation of Roses in pots, we were met by a cry on the part of a good many people, that the thing could not be done; that Roses would not grow well in pots; that they could not be carried from place to place; and other foolish objections of the same kind. Experience has, however, shown that the thing can be done by men having sufficient skill and patience, and the clamour of opposition has died away. How, indeed, could any man again talk of the impossibility of growing Roses well in pots, after the beautiful displays of them made at the London Exhibitions of the late season?

That there are difficulties in the way of this operation is doubtless true: it was that very circumstance, indeed, which led to its introduction. There would have been no credit in producing plants which every bungling gardener could grow; but it was a great triumph to do that well which demanded unusual knowledge of the principles of horticulture. Of course in this as in all other branches of cultivation, a good many mistakes were made in the beginning, and experience was only gained by degrees; for there are things which no general principles can anticipate, and for which we are constrained to trust to practice; not that they are contrary to established laws, but because we do not know how to apply the laws of nature correctly. For this reason he who, having himself overcome preliminary difficulties, volunteers to communicate the result of his experience to others, does the community good service, and deserves encouragement; for he saves his neighbours from the errors into which he himself has fallen. We, therefore, think it a simple act of justice to Mr. Wm. Paul, of Cheshunt, to mention that he has lately published a very useful little treatise* on the Pot-culture of Roses, which all gardeners will find it worth their while to procure. We shall not make extracts from that which everybody should study in the original. Mr. Paul's extensive practice, and well-known skill as a good cultivator, will insure to his precepts the attention they deserve.

There is, however, one thing that we feel called upon to notice. In giving lists of the Roses which are to be preferred for pot-culture, brief descriptions of the colours are uniformly added. This practice, which has been employed by Mr. Rivers and a few other nurserymen in their sale catalogues, cannot be too much commended. But such descriptions, to be quite as useful as they may be, should contain some information as to the habit of the varieties; for mere colour, in plants like the Rose, is by no means all that a buyer wants to be apprised of. We could therefore have wished that Mr. Paul had introduced the manner of growth into his useful little publication.

As to sale flower-catalogues, consisting merely of names and prices, we do trust they will soon be numbered with the things that *were*.

There is now such a host of so-called varieties, that it is impossible for any one, except those who have seen the plants in flower, to make a selection with any degree of certainty as to what the result may be. Kings, Queens, Prince Alberts, and such charming names as Buyckii, Smoutii, Merghelynchii, Canterburyensis, Altontowerensis, and Sickmanni, together with the long muster-roll in which eximia, splendens, superba, magnifica, grandiflora, and *omne quod exit in issima*, cut so conspicuous a figure, convey no idea of the merits of plants or of their colour, whilst a very short description, not exceeding the extent of the line on which the name stands, would enable every one to exercise his own judgment in giving his orders. This observation applies to all florist's flowers, as well as to Verbenas, Fuchsias, Pelargoniums, Calceolarias, Petunias, and the like.

Of this we can entertain no doubt, that those nurserymen who adopt the plan, will carry off their customers from those who do not. They, too, may count upon the largest number of orders who, in preparing their catalogues, show the greatest desire to inform their customers of the true qualities of the plants they deal in.

SOME weeks ago we expressed our willingness to print a form, which, when filled up, would explain the actual condition of any Horticultural Society; and we expressed a hope, that if a considerable number of such forms were filled up correctly, the comparison of them would throw light upon the true cause of the prosperity or adversity of the numerous local associations of this kind.

We have now to announce that these forms, of which the following is a copy, are ready for delivery, and will be sent to any one who may express a desire to have them.

HORTICULTURAL SOCIETY OF ———

When established ———
How many exhibitions annually ———
——when and where held ———
How many and what classes of exhibitors ———
Average amount of income ———
——from what source derived ———
Amount of subscription to constitute a member ———
Amount charged for admission to exhibitions ———
Highest and lowest sum offered as prizes ———
Number of prizes offered at each meeting ———
Total value of prizes offered at last meeting ———
Present state of the Society ———
Supposed cause† of its actual condition ———

* "Observations on the Cultivation of Roses in Pots; including Forcing and Propagation; with a List of Varieties best suited for Pot Culture." By Wm. Paul. 12mo. Sherwood and Co. 32 pages.

† If the Society is not flourishing, the probable cause of its want of success, such as want of funds, starting of rival Societies in the neighbourhood, jealousies among exhibitors, dissatisfaction with the Judges, disputes among the Managers, &c. &c., should be stated.

We earnestly invite the secretaries of local Societies throughout the United Kingdom to co-operate with us in this work, which we trust and believe is capable of producing some solid advantage to the great cause of Horticulture.

MANY persons PURCHASING PLANTS from what is generally advertised as "Dr. Lindley's opinion," are disappointed when the blooms appear in their own collections. It is worth while to inform the public that such opinions as appear in the *Gardeners' Chronicle* under the head "Seedling Flowers," are formed upon single blooms forwarded to the office. It is, therefore, very unjust to charge the disappointment purchasers may meet with to the account of any other than the party forwarding the blooms. Our recommendation is not to purchase except from a report upon the plant itself. A *really good thing* will always pay for the expense of appearing in that state. We have before us now a *border*-flower which in the greenhouse is everything it was stated to be in "Dr. Lindley's opinion:" out of doors it is really worthless.—*B.*

SUCCULENT PLANTS.

THE following is written with a view to draw more of the public attention to the cultivation of succulent plants. No group offers more facility for almost universal distribution, and every dwelling can have a few species in healthy, vigorous growth, and beauty of bloom. The humblest cottage-window may be enriched by their pleasing flowers, or made interesting by their curious forms. In the town of Cove, near Cork, the Fig-Marigold is as common as Stone-crop; hung up against the small shopkeeper's window is the Mesembryanthemum inclaudens, with its pinky-edged green leaf and purple rose-coloured blossom, shining in the light for weeks in the early summer, and gratifying the eye and taste, as well as the pleasing feeling of the owner, that under his or her protection a living creature flourishes and blooms. The M. bicolor is there too, and the silky-blossomed M. blandum, with others whose names are not easily traced for want of accessible illustrations of the family. I mention these circumstances, because the means to have these flowers is so inartificial, that many may give them a place in their attentions who are not aware of its facility; from the broken jug, teapot, or teacup, down to the very eggcup, the Mesembryanthemums are located in Cove, and all they require for some progress is light, and not to be too much watered in wintry or in cloudy weather. I do not recommend this treatment as the best, but it shows the endurance of many of the species, and invites to extended trials of what may be done in making them more general among the community. But to bring the succulents more under cultivation, so as to make them objects of interest to the florist, some aid is required. An accessible monograph of illustrations is much wanted, as the descriptions in systematic works cannot be popularly understood so as to determine the kinds, except they be accompanied by figures.

To know the names of the objects we care for, increases, because it individualises and appropriates our regard; and for this reason we desire to distinguish one thing from another; but more, we may be giving space in our rooms, and our care to plants which rarely bloom, to the exclusion of more grateful companions, who would, if domesticated, constantly express their thanks by throwing their smiles upon us. I have been trying the adaptation of circumstances to them in the open air. As to "acclimatisation," I do not believe in it. The M. aureum, planted in a hole in a wall, grew out and flourished and bloomed well for two years; rain, however, in the winter of 1842, swamped it to death. I obtained a series of species, which I potted in gravel and earth; I had all well struck and placed on a demi-wall facing the east, but the drip of an Ivy hedge bloated them in the autumn, and they became the favourite food of numberless devourers, "both those that crawl and those that fly." I was, however, quite successful with those which I put in an old window of a turret in the open air, the shelter being merely the depth of the "reveal," about nine inches or so; I covered the window stool with coarse gravel, kept together by bricks at the edge, and partly in pots and some in clumps turned out, I have my "blind window" an object of admiration. In winter a little coarse rubbish is a good great-coat for these things, but they must have sufficient drainage, or they are gone.

Drainage at the root being made certain to insure vigorous growth, these plants may be copiously syringed over the head every bright day in summer, and once a week in spring and autumn; in winter they need not be watered at all. I have now a series of Mesembryanthemums on trial as to their winter behaviour in a state of liberty, and I hope these Africans will show themselves worthy of freedom in our climate, although new to them. My preparation is this:—I have made holes fully twelve inches deep, and filled them with large clean river gravel; into this I have turned my rooted succulents, and then, having drawn the peat over the top, left them to our sunshine and showers; what they may do in the winter, time will tell, but their beauty now is most striking—they have made magnificent leaves, and M. blandum, the only one which has blown as yet, is a great beauty; inclaudens is coming out, and promises very well, but the leaves or fronds on various species are so altered in size, in depth of shining verdure, and crystalline encasement on those "who wear diamonds," that a person would scarcely know them; they now

differ far more from their forms when imprisoned in pots than many species do from one another. In these felicitous Post-office times such tenacious-lived plants may be sent everywhere. A card pen-box with a bit of wood in it to prevent the stamp from crushing it, would carry three or four species for a postage of as many pence; and if the kinds were well described, the prices of them would soon be published. I have no doubt that curious and valuable hybrids might be raised from seed; and if the gravel and peat do well, we are only beginning our exotic civilisation. Nolana prostrata, and many fleshy-leaved plants, of other groups not called succulents, enjoy this treatment extremely; but even if we are driven by the rain of winter, to keep our plantæ succulentæ within doors, we cannot do well without an accessible index to them. In fact, the Mesembryanthemum, which has grown down the wall out of its sheltering alcove, has borne last winter well, and has blown a perfect sheet of dazzling purple bloom for nearly all the summer—must have its worth unrecorded for want of knowledge.—*R., County Cork.*

ON THE PRESERVATION OF FRUITS.

AMONGST the different materials for preserving fruits, recommended by different authors, are found the following:—Charcoal, Sand, Moss, Oat-chaff, the Husks of different Grains, Oats, Sawdust, Paper, Bog-mould, Beech and Hazel Flowers, Bran, Canvas, Sealing-wax, Hay, Straw, and Fern.

The Husks of the different varieties of Corn, as Oats, Barley, Wheat, have been by some recommended for keeping fruit in; but I disapprove of them, on account of the obnoxious gases they absorb during the process of kiln-drying; before being ground, however, these, as well as Oat-chaff, answer well for packing, if the fruit has been previously surrounded with fine paper or linen, dried before the fire previous to being used.

Oats.—I have been informed that in Portugal Apples and Pears have been preserved the whole year round by being packed in air-tight vessels and surrounded with Oats, which received no injury by being in contact with the Apples. This material is not, however, generally used for packing, as the grains of the Oats are apt to bruise the Apples.

Sawdust.—This should never be used, except it can be procured from hard-wooded trees, such as Oaks, Beech, &c. The sawdust of resinous trees should on no account be used for this purpose, as it is never entirely free from a resinous smell, which gives the fruit a disagreeable flavour; it might, however, be used for packing fruits in, that are to be sent to a short distance, but each fruit, previously to being immersed in the sawdust, should be well surrounded with linen or paper.

Paper.—This material is employed for preserving fruits, but it becomes expensive where there is a large quantity to be preserved. If charcoal or sand are used, this and all other covering may be dispensed with.

Bog-mould.—I have been informed that this has been tried for preserving Apples during winter, and that it is found to answer the purpose; but having little experience with it, perhaps some correspondent that has used it will favour me with the results.

Beech and Hazel Flowers.—I can recommend the use of these for packing and preserving fruits, especially the more delicate kinds. They answer well for packing Grapes, Peaches, &c., first putting in a layer of the flowers, and then a layer of Grapes, or Peaches, until the box is full; the fruits will be found as fresh at their journey's end, as when first put in, with the exception that the bloom of the Grapes will be destroyed. However, it may be renewed by dusting some fine flour over the berries, holding the bunch by the stalk, or stem, during the operation. Beech and Hazel flowers can easily be procured; they should be collected soon after they have fallen from the trees, and put into an airy room to be thoroughly dried before they are used.

Bran.—When this material can be procured, it will, perhaps, answer equally as well as the former; and being of a finer nature, it will more readily fill up the crevices between the fruit.

Canvas.—This material has been strongly recommended by some, with a view to prevent any dust from settling on the fruit; it also tends to prevent their evaporation, by preventing the air from acting on them.

Sealing-wax.—This is much employed in France, and other parts of the continent, for preserving Pears. It is applied by sealing up the end of the stalk as you would seal a letter, only not putting quite so much on. In this way fruit is preserved for some time.

Hay, Straw, and Fern.—These have been used for a long time, for covering Pears and Apples, in the fruit-room, and likewise for packing; but I consider them coarse for packing, when other materials of a lighter nature can be procured.

Pitting.—Apples may be kept in pits after the manner of Potatoes; we have seen this practice both in France and England with success; but the fruit does not keep long after it is taken out; consequently, only a small quantity should be taken out at one time, and the pit should be instantly closed up, to prevent the admission of air. Apples kept in this manner will be found quite sound and good in the months of May and June, or even July, if they have been pitted in a careful manner, all bruised ones being rejected, which would destroy the others. A little powdered charcoal should be carefully sifted over the Apples as they are laid up, which should be done in regular layers. The charcoal absorbs any moisture that is given off by the Apples, and keeps all cool. After this is done, take some clean Wheat-straw, or Hay, and lay it over the fruit, to the thickness of a foot, fastening it down with ropes made of the same material, then cover them up with earth to the depth of another foot. This covering will prevent any change in the atmosphere from reaching the Apples. The operation should be performed in dry weather.

Preserving fruits on detached shoots has been adopted, but with little success. The experiment was tried with Grapes, which were detached from the main branch, a piece of the shoot, about a foot long, being cut with the bunch. Some were immersed in bottles of water, others were suspended in the fruit-room, and part was left on the shoots in the Vinery. It was found that those in the Vinery kept as long as the others. A good plan is to cut the bunches, and turning them upside-down, suspend them in a room with a steady temperature a little above 32°. Another method is to cut off the bunches, with a foot of the stem on each side of the bunch, sealing up the cut ends with sealing-wax, and suspending the bunches in the above-mentioned temperature. The following is a good way of preserving ripe Grapes:—Procure some tin cases of any convenient size, and put in a layer of dry sand or charcoal and then a bunch of Grapes, until the case is full; seal down the lid and make all air-tight, and bury them to any convenient depth in the ground. This plan will likewise answer for late Cherries, Plums, Gooseberries, Currants, &c. These fruits in some gardens are retarded in their time of ripening, by being covered with mats or nets, which is an excellent plan, and ought to be more generally adopted, as it insures a succession. Grapes, Peaches, Apricots, in the open air, may be kept for some time hanging on the trees after they are ripe, by the same means, but their flavour will not be good. Red and white Currants in the same manner will even keep good till the end of December. Ice-houses have been recommended for preserving fruits; but they are objectionable, on account of the damp moisture which they contain. A dry, cool, and airy room, free from all atmospheric changes, is the only place where fruits can be preserved for any length of time.

It will be found that some of the finer sorts of Pears and Apples are liable to crack before they are quite ripe; therefore they should always be gathered and taken into a hothouse, in order to ripen them as quick as possible. It often happens that one half cracks while the other remains sound. Those that are sound should remain on the tree until the proper time for gathering them arrives, which is known by gently lifting them up, and then letting them down with a slight jerk; if ripe, they easily detach. I have seen the following plan adopted with success:—When ripe fruit was wanted before it had arrived at proper maturity in the open air, those were selected which appeared to be ripest; they were placed in a hot-house, and suspended over the hottest part of the flue, in a basket, till they were fit for use; the remainder was left on the trees for a succession. The ripening of Peaches, Nectarines, Apricots, Plums, Cherries, Strawberries, Gooseberries, Currants, &c., may be accelerated in this manner with the utmost advantage. I am not aware that any method has been adopted for the preservation of the Pineapple, for any length of time. I have seen it cut up and immersed in bottles containing spirits—as brandy, whisky, &c., to which it imparts a pleasant and delicious flavour; Plums, Cherries, and Apricots, are used for the same purpose in France.

The sweating of Apples is not to be recommended, as the flavour of the fruit is much deteriorated by it. The less fruit is handled the better; and the less it is exposed to atmospheric changes, after being gathered, the longer will it remain plump and sound, without becoming dry and mealy.

Green Fruits—For preserving, must be gathered when quite dry. Having provided some wide-mouthed bottles, or tin cases, commence by cutting off the berries, one by one, from the stalks till the bottles are full; cork them up tight, and seal them over with some wax, then place them in some cool, airy room, or, what is better, plunge them into the open ground, surrounding each bottle with some charcoal, or dry sand.

Shell Fruit, as Walnuts, Nuts, Chesnuts, &c., may be preserved for a year or two by being divested of their outer shell, and thoroughly dried. In jars, or tin cases, put in a layer of charcoal or dry sand, then a layer of Nuts. Proceed in this way until they are full, properly securing each lid, to prevent the admission of air; when finished, bury them in the open ground, or in some cool and dry cellar.—*J. McIntosh.*

THE ROSE-GARDEN.—No. XVII.

(*Continued from p. 572.*)

Shape of Trees.—A tree well formed, with a promising head, and in health, ought, the spring succeeding the budding, to have a clean, straight stem, no lumps nor knots, one shoot quite at the summit, and two, or at all events one other shoot as near as possible also to the top; if there are two shoots only, at opposite sides to each other; if three, forming a triangle; if more, as nearly equidistant from each other, in the diameter of the stock as possible (and here be it observed that the more shoots, at the top of the tree, the handsomer and quicker is the head formed,) each with a bud inserted in it, close to the stem: and at the cross cut, where the bark of the bud usurps the place of the original bark of the stock, a sufficiency of sap ought to have exuded, not only to have joined the bark of the bud with the unmoved part of the bark above it, but also to have joined the separated part of the bark of the stock to the same place, and thus linked the two barks of bud and stock to the single bark of the stock above them.

The edges of the vertical slit in the bark do not heal by attaching themselves to each other, but the bark of the bud underneath them forms a connecting link, and the edges above mentioned perish insensibly away, leaving little or no scar behind. The second spring, the tree becomes more perfect, the extraneous parts of the stock, if any remain, are cut off, as well as those of the shoots, and the head so arranged as to throw its buds where they are wanted to make it round, even, and handsome. If, however, some shoot be obstinately bent on growing in any direction, spoiling the appearance, and crossing the others, it should by no means be removed on that account alone; but if a little twig be placed across from it to any other convenient branch, to confine it for the season in the place desired, the ligature may be removed in the succeeding spring, or even in the same autumn, when the sap is down, and the shoots preserved.

T. In order to keep them distinct and clear, the annexed cut shows the shoots at a much greater distance from the stem than they will in reality be, the buds they spring from having, as before-mentioned, been placed as near to it as possible.

Lastly, the third spring the tree should show itself with all its wounds nearly closed, its buds strong, full, and healthy, and it should look perfectly natural, those parts of the shoots upon which the buds were placed being incorporated with the stock. The bark clean; no dead wood; and wherever a shoot has been shortened, the place so grown over as to leave no blemish, which will be the case for some time wherever any wood more than one season old is cut away, and a thin shoot of a single year springs at the end of it. This is the reason why forest-trees look so ill if shortened when old, viz., the taper appearance is destroyed, wood of five or six years' growth is continued by the shoot of a single spring, and thus a piece of wood, of the diameter of half a dozen inches, has a little mean-looking shoot, or in all probability half a dozen, not thicker than horsewhips, at the end of it.

Whatever it is worth while to do, it is worth while to do well; work properly commenced does not require that constant superintendence which a bad beginning is certain to render necessary, and which eventually involves a much greater expenditure of time than any labour bestowed at the outset could have demanded.

Home Correspondence.

Provincial Horticultural Societies.—Your remarks on these, p. 499, are well-timed. All country societies of the kind move, as it were, by fits or jerks; and there will, of course, be no permanent cure for this fitfulness until we are well acquainted with the causes. I have attended many Shows of the kind for the last 10 or 12 years, sometimes as exhibitor, and frequently as judge; and have therefore had a little experience in the matter, the result of which I hope may be of service in the investigation. Fashions, we all know by experience, will change; therefore I am afraid it is useless to expect that the public will long patronise one set of objects, however dazzling their appearance or high their cultivation, without a relief of some kind. This seems to point out a necessity for variation in the objects of societies, year by year; which change, of course, rests in a very considerable degree with the respective Councils. Now, without wishing to cast any imputation on any given society (a thing I will endeavour studiously to avoid as quite foreign to the purpose), I must say that the Councils of provincial societies are frequently very inefficient in character, as to the objects sought to be attained—viz., thoroughly satisfying that portion of the public which possesses a more refined taste, and so remunerating the various grades of exhibitors as to send them home satisfied, and eager to show their faces at the next meeting. Now, whence the inefficiency complained of? A spring meeting is convened to arrange the future campaign; the Council meet, and instead of being composed of one-half practical gardeners, is chiefly made up of tradesmen and mere florists, who care little for the progress of general horticulture: the former esteeming a huge Cauliflower or Cucumber, and the latter a bed of Tulips, to be the *ne plus ultra* of all gardening. Something more definite should be observed in regard of these Councils, especially as to the number of their members. They are generally too few in number; there should be seven at the least, in my opinion, which might be thus constituted:—two respectable tradesmen; two florists or amateurs of good standing; three general gardeners; at these meetings, the general awards should be classified distinctly as to what portion of the funds should belong to the amateur, what to the florist, what to the general gardener, and also the cottager; last, though not by any means least, a proper arrangement of the mode of competition; for it is found in gardening as in horse-racing, that if the company is too good there is small chance of competing with success. The secretary should, by all means, be a paid officer—what is done without stipend, is sometimes half done, and much depends on the secretary's punctuality and courtesy in taking care to make all parties, more especially subscribers, acquainted with every move of the society, so that nothing appear to be done in secret. To this end I

would have a balance-sheet of the state of the society's funds, posted at every meeting at one corner of the show-room, with an invitation appended to it, for those subscribers who felt inclined, to examine the secretary's books as to the details, after the business of the day had passed by. There is no small difficulty at country Shows in obtaining good judges, gardeners who are exhibiting in several classes being by no means eligible; and few gardeners are so well off as to travel a distance of twelve or fifteen miles at their own expense, and give their services gratuitously into the bargain. The consequence is, that very frequently incompetent judges are selected, and if a first-rate gardener happens to be joined to them, he has it all his own way, and the others are reduced to mere automatons. Much difficulty exists in getting the subscriptions—this is shameful, but it is too true. A good plan, in my opinion, would be to collect the subscriptions very early in the spring, and to state in the circulars that no other would be considered available to the purposes of the current year, than what were received by an appointed day, soon after which the arrangements would be completed, and the subscriptions published in the county newspaper. It is customary to charge a small sum at the doors for visitors inspecting the rooms who are not subscribers: this is, in many places, not adhered to so strictly as it ought to be. The door-keeper should be a stranger to the neighbourhood if possible, and have strict orders to exact the sum appointed from all who did not possess tickets. The chief cause of failure, however, is want of sufficient funds—the conductor of these meetings has, in most cases, one of his hands tied. There is a good deal of expense incurred in the mere machinery of such meetings, and after such is deducted from these cramped subscriptions, the rest is obliged to be cut out into such meagre prizes, that few but those who are independent, care to compete for them: ninepenny and eighteenpenny prizes are by no means uncommon at the country Shows, and many a poor wight goes home with a half-crown in prizes, who can ill afford to pay his travelling expenses. There can, therefore, be no permanency or strength in these societies, until the amount of subscriptions is considerably improved. The above facts, though not applicable to the great metropolitan societies, are, I am well assured, to many of the provincial ones.—*Argus.*

Pelargoniums.—I have had some of my plants change on the edges of the leaves like the inclosed, giving the plant the appearance of a variegated sort. The leaves appear quite healthy, with a regular pale border, which is principally confined to the old leaves. The only thing I can suppose it to arise from is, that some time since I had the Pelargoniums watered with sulphate of ammonia, which had been exposed to the air for some considerable time, and had become quite fluid; and it is possible that it might have been partially decomposed, and a free acid (sulphuric) left, which we know has the power of bleaching vegetable colours.—*H. Groom.* [This is a curious case. The leaves have a pale border, about ¼ inch deep, as regularly limited as if it were really a permanent variegation.]

The Robin and Hedge-Sparrow.—It is my misfortune to live in a large town, so that, when at home, I see none of the feathered race except that bold, impudent, sooty, but withal comical fellow the house-sparrow. My small garden is some half mile off in the suburbs, and I do all in my power to induce the birds to frequent it, though, as an incessant warfare is kept up against them by every "idle apprentice" who can lift a gun, they are far from numerous. I formed this garden in the winter of 1836, and immediately a robin took up his quarters with me in the greenhouse, going out during the day, and returning at night to his roost in some of the shrubs therein. I was at first puzzled to find out how he got in, till I noticed that a triangular piece of glass had fallen out of one of the small panes in the roof, which are three inches broad, and saw him enter by alighting on the edge of the pane below, stoop his head, hop through the hole, and expanding his wings fly to his roost. Of course he could not get out by that opening, and therefore on entering the house every morning I gave him the option of making his exit for the day, which he generally did at once. If, however, the weather was stormy, or a keen frost or snow was on the ground, he used to return in a few minutes with all his feathers standing on end, and very intelligibly, though mutely, beg for admittance to his old quarters, where, having plenty to eat and drink, he spent his time in watching my movements, or hunting about amongst the plants. In very cold weather he prefers a stove heat, and should I leave the door leading into it from the greenhouse ajar, I am sure soon to find him after me. When there he appears to enjoy himself much, he gathers his puffed out plumage tight about him, and looks as he does in summer-time. His large, beautiful, intelligent black eye (only equalled by that of the nightingale) is in constant watch of my motions from his usual perch upon the suspended orchidaceæ, or the rods intersecting the roof from which they are hung. In this manner he has passed every winter since 1836, returning to his quarters about November, and leaving them in February or March. He has now become so tame that he feeds from my hand, and when perched thereon sometimes amuses himself by picking out any crumbs, &c., that may have lodged underneath my finger nails when preparing his food. When in the stove, the moment he sees me enter the greenhouse he flies to the door which separates them, fluttering against the glass in his attempts to reach me, and as soon as I open the door, alighting on my hand, seems grievously disappointed if there is nothing eatable in it, although he may have plenty of food within reach. In summer he and his mate build their nest close by, and are very familiar, though they will not come to the hand. Another pair have built twice with me this season in the same mouse's hole in an old hedge which I retain in my garden, and allow any of the family to approach close to them without being alarmed, popping out their heads in reply to the challenge of a whistle to them. So tame are my young robins, that during summer and autumn it positively requires that one watch their movements to avoid injuring them when hoeing and raking, so closely do they come about one: and it is no uncommon thing for my sisters, when working amongst their flowers, to have three or four of these youngsters in constant attendance during a whole morning. The hedge-sparrow is another of my especial favourites, for I consider it the most affectionate of birds, neither yielding to the dove or the love bird in this respect. They always go in pairs, and having once taken each other "for better for worse," never separate, and seem unhappy when out of each other's sight even for a moment. They are most inoffensive, subsisting chiefly on insects and their larvæ, and ought to be kindly treated by every gardener. Two pair of them seem to consider my garden their home, as they remain with me summer and winter, building in the shrubs, and in cold weather keeping about the open sheds, &c., and coming regularly to be fed. I often stand and watch their movements upon the lawn, which they hunt over in search of insects, in that half-hop, half-flight, so characteristic of this bird, always within a yard or two of each other, and keeping up their low twittering note. Should one of them happen to get out of the other's sight, the moment it is missed you hear the call of its partner, and can see how distressed it is at its absence, whilst the well-known reply, and the delight on their meeting, almost invariably elicits the song of the male. "Bless their kind hearts!" say I, with Mr. Waterton, the quotation from whose delightful work in your last has induced me to send you this.—*Pons Ælii.*

Wasps and Bees.—I have tried Professor Henslow's method of destroying wasps, and found it to answer admirably. I put a small quantity of spirits of turpentine into a bottle, and at night, when the wasps were all at home, the bottle was inserted in the mouth of the nest; a spadeful or two of puddled earth was put over this, about a foot in thickness, in order to make the work secure. My man, who had never employed anything but gunpowder and brimstone for this purpose, was doubtful about success. In twenty-four hours, however, all the straggling wasps having disappeared, the nest was opened, and all were quite dead. My man said they would come to life again if he did not smash them with the spade; but before doing so he took out about a dozen of the white waxy-looking sealed-up bags, containing the young embryo wasps; these were wrapt in paper and taken home; in a day or two the paper was opened, when some of the bags had been converted into mature wasps, others appeared as large moveable maggots, and some were the same as when first taken out of the cells. I have a hive of bees not far from the spot where the wasps' nest was found, and I had noticed wasps about the hive. I have watched them go into it; the bees did not appear to resist their entrance, nor did I see any symptoms of fighting. I diminished the entrance of the hives to two small holes, which are only capable of allowing one bee to go through at once, and since that alteration a larger number of bees are generally about these holes. This morning I did not see one wasp enter the hive; they came and flew about, went once or twice near the entrance, and flew away. Will any bee-keeper inform me whether or not the destruction of bees is the consequence of wasps entering the hive, or whether robbery would satisfy the intruders? whether or not the bees would fight them after they had entered the hive? and whether or not the diminished entrance will do any injury to the bees?—*Jasper Stokes, Birmingham.*

Gray Parrot.—I have one of this species which once suffered in the same way as a "Constant Reader's," but is now in perfect health; the cause, I doubt not, was the want of water. My pet is thus managed:—As soon as convenient after breakfast, the door of the cage is opened, and Miss Polly then mounts to the top of her cage, and there expands her wings, gives them a good shaking, and gets rid of a great deal of white dust, which, I doubt not, is dried skin. While she is thus employed her cage is thoroughly cleaned out, the bottom strewed with sifted gravel and about a tablespoonful of Hemp-seed put into one side of her tin, and her cup filled with fresh water; bread or toast is soaked for a minute or two, but not made pappy, and then given to her; at dinner, or luncheon, she has a bit of meat or a bone not closely picked, but all fat or butter must be carefully removed from it; if we have a milk pudding she has her share; at tea the toast is again prepared, but in no case is more given than the bird can consume. A cup of clean spring water always stands in the bottom of the cage; but if a "Constant Reader's" polly is as mischievous as mine, it had better be fastened to the wires; my bird hangs in a large porch furnished with flowers, and more than once I have received the contents of the cup on my head or back. When moulting, a Clove or two should be put in the water, and by way of a *bonne bouche*, she has from time to time a bit of captain's biscuit. Parsley must be carefully withheld—it is most injurious to parrots. With the above treatment no bird can be in better health, more lively, or in better plumage. The "Constant Reader's" parrot should have as much air as possible on fine days, and as much liberty on the top of her cage as convenient, when in the house.—*X.*

——Miss Kenworthy, of No. 3, Russell-street, Liverpool, is so obliging as to say that, if a "Constant Reader" will send her his address, she will be most happy to give him such information as will effectually cure his bird, and restore its plumage.

Bees'-Eggs.—At p. 572, "A Lover of Truth" says—"As the queen knows when she is to lay a drone or male egg, in what way is that knowledge acquired?" Again, he asks—"Does one ovary contain male eggs only; or are they to be found in every ovary?" According to Hunter, the eggs are not contained in ovaries, but in twelve small ducts; but it is hard to say how the male and female eggs are situated. I shall, however, hazard an opinion respecting their being deposited in the cells. The queen bees differ from other insects that lay their eggs only at certain times, and that have the male and female eggs mixed together; if the season permitted, she would lay eggs to produce working bees during the whole year, and those to bring forth drones only at certain periods. Now the latter may be situated in the duct or ducts, so that they can only exist at certain periods, and the insects know of course by instinct, the proper cells for their production. It may be worthy of remark that after the queen bee has layed drones' eggs and a few to produce queens, she lays only workers' eggs; while in autumn, others of her race, such as humble bees, wasps, and hornets, rear none except drones and queens, especially the yellow pests, who often shave off the workers' cells from the upper combs as materials for forming queens' cells below. Drones are reared in cells of the same size; all this is quite in accordance with the manner in which they increase their species. In reply to the query respecting difference between the size of male and common eggs, I may state that I have fancied that the former were a shade larger; but the exact age of the eggs ought to be known, for they of course swell before the larvæ burst them. "A Lover of Truth" mentions the number of drones' eggs his queen bee lays, and also that of workers' eggs, which he says was 1000 daily for three successive months. This not only exceeds Huber's number—200 daily—but also Schirach's highest number, which is 100,000 in a season.—*J. Wighton.*

Flower Gardens.—I beg to confirm "E. C.'s" statement (p. 525) respecting the appearance of these. On visiting Marston Rectory I was delighted with the brilliant display in the flower garden; the beds, both with regard to flowers and foliage, were all that could be desired, and I was informed that they have been equally beautiful for four months past. This, taking into consideration the bleak situation of the garden, and very bad soil of which it is composed, reflects the greatest credit on Mr. Melville, who is gardener there. The other gardens alluded to by "E. C." are, and have been, the very acme of perfection. The beds are planted with the same kinds of plants that are generally to be met with in good gardens.—*A. A.*

Strawberries and Asparagus.—I beg to offer a few remarks upon the statement of Mr. Bree, of Stowmarket, respecting the culture of these plants. Of Strawberries he says, that "he had such a capital crop, because he did not cut off the leaves." The discussion which took place last year about cutting off Strawberry leaves, induced me to adopt the following system by way of experiment:—Of one Strawberry bed I cut the leaves all off one half, and the other half I did nothing to; I cannot, however, speak in praise of the latter half: having other two beds both in the same aspect, I was anxious to learn from which of the two I could obtain the most fruit. From one bed I cut all the leaves and manured it immediately. From the other I cut all the runners, and left the stools entire, and then manured it, which I could easily do, as I plant my Strawberry rows 2 feet apart. The bed that I thus treated was but one year old; the other bed was three years old — that from which I cut all the leaves. I can vouch that I had quite as many Strawberries from the old bed, as I had from the new one: this I did not expect; both the beds were of the same sort, viz. Elton Pine. Have any of your readers made a similar experiment? With regard to Asparagus, Mr. Bree goes on to say, that "J. Squinell killed all his Asparagus by cutting off the tops in June." This I have no doubt was the result; but, as was stated at p. 317, of this year, I imagine that salt should only be applied when the plants are in full growth. I consider that Mr. Bree practised nearly as dangerous a system as his friend "Y. S," in applying salt at the time when the roots were in a state of rest. I should say that salt would be applied with more advantage in spring — say in the month of March; put it on immediately after the beds are dressed. If the weather is dry, water the beds well, previous to putting on the salt, and then 2½ lbs. of salt to the square yard might be used, which I have no doubt would give great satisfaction.—*Villagius.*

Vines.—I have two vineries; No. 1 has the canes trained to the rafters, one only to each. This house is heated with hot water in iron pipes, and has besides about eight cart-loads of tan in it. In No. 2, the Vines are trained horizontally, the whole length of the house (about 20 feet); this house is also heated with the same sized pipes, but no tan is used in it. Now it so happens that this house has matured its produce better, in every respect, than the house with the tan. From what cause has this arisen? Was it the horizontal mode of training which caused it, or was there too much moisture in the tan to allow the Grapes to colour, from excessive evaporation. Heat and air were allowed to both houses in nearly the same degree. Perhaps I ought to mention that the tanless house is situated considerably higher than No. 1, to reach which the Vines are carried a greater distance

before their fruiting buds are allowed to expand. Has this a tendency to elaborate the sap more than in No. 1? Perhaps some of your correspondents may throw light on this subject.—*A Subscriber, Maidstone.* [The last circumstance is probably the cause of the effect observed.]

Morphology.—It is an important consideration in connexion with this subject to know, that the proper food of plants consists of the elements of which their structure is composed; and that if a soil is destitute of those elements no vegetable development will be apparent, so far at least as the particular plant analysed is concerned. Such being the case, it naturally follows that what the stem is to the soil, the flowers and fruit are to the branches, namely, a higher structural result; or in other words, the flowers and fruit may be said to be rooted in the stem and branches, and supported by more perfect juices than the original roots afforded. Am I correct in these conclusions?—*C.** [Yes].

Culture of the Onion.—I beg to mention a method I have been practising for the better growth of Onions. The soil here being the worst I ever met with for the culture of Onions, forced me upon trying an experiment. Late in the autumn of last year, I caused a piece of ground to be dug deep and left in a rough state; I then procured a quantity of hog manure, which was spread over a portion of the prepared ground; at the same time I got some horse and cow manure, which were also spread separately on the remaing portions of ground. Previous to laying on the manure, the ground was well salted with common salt. I suffered the manure spread over the surface to remain through winter until April, when it was forked off and wheeled away. Onions were drawn from the seed-bed, and transplanted on this piece of ground, and the result has been as fine a crop as could be desired. Of the three kinds of manure tried, I find that the hog manure has answered the purpose best, but the Onions on all the portions are good, whilst in other parts of the garden not so prepared, they have failed, and are not worth gathering for keeping, as three parts of them are grubbed, while the piece experimented on is perfectly free from grub.—*J. L. Snow, Swinton Park.*

Long Vitality of Seeds.—Some time since a well was sunk in the Isle of Wight 300 feet in depth, and out of the earth from the very bottom Charlock sprung up. When and how could that seed have got there? The whole of the place in which I reside was, about thirty years ago, garden ground. Last year a sewer was made in the public road, and I had some of the sandy gravel laid in my garden; this spring a number of young Cabbage plants have sprung up out of the gravel, and as I have had no Cabbage-seed, they must have lain dormant and have sprung into vitality upon being exposed to the influence of light and air.—*Semen.*

Strawberries.—How do scientific gardeners account for the habit of Strawberry-plants forced under glass in spring continuing to form blossoms and fruit afterwards during the whole summer, when turned out into the open air? For many years past I have forced Keen's Seedling Strawberry by keeping it under glass from February till the beginning of May, when the fruit is just turning ripe. I then place them on a south border in the pots in front outside my Grape-house; this gives them a high flavour—even higher than those planted in the open ground. This year I had an immense crop in May from my forced pots so treated; and, finding as large a supply of blossoms the end of June, when the first crop was gathered, instead of planting them in the open ground, I gave them a watering of liquid guano, and the second crop in July was as abundant as the first in May. Mr. Markham, gardener to the Hon. R. Clive, of Hewell, came and looked at them, and expressed, with other gardeners, his surprise at the very abundant second crop. The beginning of this month, finding more blossom peeping through the leaves, I gave them another watering of diluted guano in rain-water; and a third crop is setting, and from the vigorous appearance of the plants, I expect they will go on to produce fruit till cut off by autumn frosts. How is this? We know that, with the exception of the Alpines, the other Strawberries bear but once in a summer, in the natural ground. Why should the forcing in the spring give the disposition to flower the rest of summer?—*John Williams, Pitmaston.*

Nepeta Cataria.—I beg to inform "A. H.," p. 573, in answer to his inquiry about this, of the following circumstance:—I had a fine plant of it last year, which disappeared unaccountably at the time. I attributed it to the carelessness of the gardener or the ignorance of young weeders; I searched the border where it grew, and found a stout seedling, which I surrounded with a fence of twigs stuck firmly into the ground. It became a flourishing plant, and I prided myself upon my contrivance to preserve it; but the fence and the plant were totally destroyed not many nights after, and upon examining the place, I found the surface of the ground where it grew completely flattened and smooth, and having a quantity of cat's hairs well pressed into it.—*J. B.*

Potter's Guano.—I have tried Potter's guano on Turnips, Cauliflowers, &c., with success. The proportions were, one-fifth guano, four-fifths night-soil; on the first I sowed it broadcast, and watered it well afterwards; on the other plants I removed the earth about half an inch deep round the stem, and to the extent of about six inches in a circle, and then spread a handful of the mixture on the ground so prepared, and covered it over again with the removed soil. All the plants were well established before using the compost, and now appear remarkably healthy. My garden is a stiff clayey soil. Potter's guano is an expensive manure.—*Falcon.*

Scorching Effects of the Sun.—I should think it is probable that the cause of Vine leaves becoming discoloured under the influence of the sun, after being syringed, was in consequence of the water containing some ingredient that acts injuriously upon the leaf, after the water has been evaporated by the heat. From the various accounts given by correspondents, they do not all complain of their Vines suffering under similar treatment; I should, therefore, recommend some of those who have experienced the ill effects of syringing under a hot sun, to analyse the water.—*Falcon.*

The Polmaise Heating.—I am surprised that any one experienced in gardening, especially early forcing, should defend this system, as understood by the explanations of it we have received in the *Chronicle.* It is no defence of a system to invoke the crest-fallen appearances of some who considered themselves the best Grape-growers in Scotland; or to allege, that "the Vines in this house grow as freely as common Cabbages in a well-manured garden, or Willows by wet ditches." A man may as well say that Abercromby, Nicol, and others of the old school, never did grow Grapes at all. Why, some of the best Grapes ever exhibited before the Horticultural Society were grown in houses heated by common flues. But surely those gardeners would have been glad to substitute hot water pipes for dirty smoke-flues. Every gardener of experience is as well acquainted with the advantages of hot water, as he is with the disadvantages of flues, however well constructed; and any modification of them is but a poor apology for a perpetuation of the evil. In the name of gardeners and gardening let us have more satisfactory reasons for abandoning our experience of the last 20 years, of a system which all men of science and practice defend, and which all liberal men, who can be liberal, adopt.—*R. Glendinning.*

Coniferous Plants.—Allow me to observe, with reference to the remarks of "Waldeve," p. 557, that a small work on the Coniferæ suited to the climate of Britain is now in course of preparation; but as it will include all necessary information regarding the recently-introduced Pines, which have not yet been properly tested, it will take a few months to perfect the somewhat contradictory opinions which are abroad respecting them. With regard to the Deodar, Araucaria, P. excelsa, and others, it would be well if planters were to take the trouble to ascertain whether the young trees they purchase have come immediately from under glass, or have been growing under the open firmament. Plants which have been forced into unnatural luxuriance in glass-houses, and are immediately removed to cold and exposed situations, must of course suffer greatly from the change; while the same species reared in the open air will succeed perfectly well.—*J. Grigor, Norwich.*

Societies.

HORTICULTURAL SOCIETY.

Sept. 3.—COLONEL FEILDING in the chair. M. C. B. Cave and W. Stirling, Esqs., were elected Fellows. Of Orchidaceæ there was a considerable number, but among them there was nothing rare or remarkable. Mr. Don, gr. to F. G. Cox, Esq., sent small but good specimens of Cymbidium giganteum, Zygopetalum maxillare, Brassia Clowesiana, Stanhopea venusta, and another species, apparently Wardii, having a fine spike of bloom, together with the variety of Miltonia candida called flavescens, Zygopetalum cochleare, and a good Cattleya Harrisoniæ. From the same collection was also Calanthe variabilis, a small Sarcanthus teretifolius, Eucomis punctata, and a plant of Warrea tricolor, together with the downy variety of Justicia carnea, and an Achimenes pedunculata in good condition, for which a certificate was awarded.—From Messrs. Rollisson's, of Tooting, were plants of Stanhopea venusta, guttata, and a variety of insignis called atrorubens, producing pretty dark-brown spotted blossoms, together with specimens of Oncidium sanguineum, Cymbidium lancifolium, Miltonia Clowesiana, and a variety of the same, named nebulosa.—Mr. Redding, gr. to Mrs. Marryat, sent a fine Cattleya crispa, having five spikes bearing 21 blooms, but almost out of flower; a plant of Eulophia macrostachya, and a specimen of the old Guzmannia tricolor, a dry stove plant, seldom seen in bloom, for which a certificate was awarded.—A cut spike of Stanhopea graveolens, a fine noble looking flower, but emitting an odour by no means pleasant, was contributed by Mr. Errington, gr. to Sir P. G. Egerton, Bart.—Of Fuchsias two seedlings were produced, one from Messrs. Lane, of Great Berkhampstead; another, called Unique, from Mr. Mallyon, gr. to T. Brandon, Esq. The colour of the flowers was somewhat in the way of Chandlerii, from which the latter was raised.—Messrs. Henderson, of Pine-apple-place, sent a plant of Acropera Loddigesii, finely in bloom; Eriostemon scabrum, the small white flowering Erica perlata or purialis, Begonia Martiana, with flesh-coloured blossoms, and a good specimen of Echites splendens, having one flower in good condition, which served to show what a beautiful thing it is. It was introduced a year or two ago by Messrs. Veitch and Son, of Exeter, and is one of the finest climbing plants we have obtained for years. It not only produces fine trusses of bloom for a length of time, but each flower is said to continue in perfect beauty for seven or eight days, and sometimes even longer.—Mr. Corbin, gr. to T. Hepburn, Esq., received a Banksian Medal for a magnificent plant of Lilium lancifolium album, having eight stems, each bearing from eight to ten expanded blooms, and showing what it is possible for good management to do with one of the finest plants in cultivation for adorning the conservatory at this season.—From Mr. Glendinning, of Chiswick Nursery, was Clerodendron fallax, in good condition.—Mr. W. P. Ayres, gr. to J. Cook, Esq., received a certificate for a collection of cut blooms of Verbenas, comprising some of the best varieties in cultivation.—Of FRUIT some remarkable specimens decorated the tables; foremost among which was a Providence Pine from Mr. Mills, gr. to Baroness de Rothschild, measuring 13 inches high, and 24½ round, and weighing 14¼ lbs. The number of pips in height was 12. This was the largest Pine ever produced before the Society, and excepting one lately cut from the same gardens, which, we are informed, weighed 15½ lbs., it is probably the largest ever raised in England. Independently of its size it was beautiful in form, and is a remarkable specimen of horticultural skill; there was no disproportion between the crown and the fruit. It was stated to have been raised in a pit contrived by Mr. Mills for growing Cucumbers in. The large Silver Medal was awarded for it. Mr. Mills also sent a fine specimen of his Champion Cucumber, measuring 27 inches long. Other Pines present, although totally eclipsed by this one, were by no means unworthy of notice.—Mr. Henderson, gr. to Sir G. Beaumont, received a Banksian Medal for a handsome Globe Pine, weighing 5 lbs. 13 oz. and measuring 8 inches high and 17 inches round. The number of pips was 9.—And Mr. Fish, gr. to H. H. Oddie, Esq., sent 3 Pines, one a seedling weighing 3 lbs. 11 oz., the other two Providences, the heaviest of which weighed 8 lbs. 7 oz., and measured 8 inches high and 19 inches round. The number of pips was 9. It was a fair specimen of good cultivation; a certificate was awarded for it. Mr. Fish also sent a Valencia white-fleshed Melon, weighing 3 lbs. 4 oz.—From Mr. Murray, gr. to the Marquess of Bath, were 3 Globe Pines, the heaviest of which weighed 6 lbs., and measured 7¼ inches high and 18½ inches round. The number of pips was 9.—And, finally, from Mr. Saunders, gr. to C. Hoare, Esq., was a seedling Pine, weighing 4 lbs. 14 oz. It was a well-formed fruit, but was not in such good condition as could have been wished, being ripe on the under part and not at the top.—Mr. Parsons, gr. to A. George, Esq., received a Banksian medal for five fine bunches of Muscat of Alexandria Grapes, and a certificate was awarded to Mr. Jones, gr. to Sir M. Disney, for good specimens of Grosse Mignonne Peaches. Excellent specimens of Peaches and Nectarines also came from the garden of the Rev. J. Cook, of Newton-hall, Northumberland. They consisted of Red Magdalen and Violet Hâtive Peaches, and Elruge Nectarines, and were remarkable for their size and fine colour. They were stated to have been grown on the open wall, at an elevation of 500 feet above the level of the sea, and exposed to the whole of the blasts of the German ocean. Unfortunately, however, they arrived after the list of awards was made up, and in consequence of this no Prize was assigned them.—From Mr. Murray, gr. to the Hon. R. H. Clive, were three varieties of Russian Apples, named Yellow Transparent, Long-striped Whran, and Yellow Whran. The transparency in the first was, however, wanting, as is generally the case in specimens produced in this country.—S. Parmeter, Esq., sent specimens of a seedling Apple grown by S. Platter, a cottager at Aylsham; being of last year's growth, they were a little shrivelled, but were nevertheless in a state of good preservation. They were stated to have been, until within the last few weeks, quite firm and juicy. They looked like some sort of Russet, and had the useful property of being preserved in good condition over a second season. A certificate was awarded for them.—Among miscellaneous objects was a Ward's case, from C. B. Warner, Esq., containing Ferns; and two arrangements of the leaf, fixed on paper in a triangular form, by Lieut. T. Tilley, R.N. The first arrangement consisted of the Elm leaf in its upward and downward progress, or through all its growing and fading changes, from the young leaf in April to that of the skeleton, or last stage of decay, in the April of the following year, embracing a period of 12 months. The ripe leaf formed the apex of the triangle, or the point where progress ends, and decay begins. The other design was the Poplar leaf in a skeleton state. A few other leaves of different kinds were added, which not only served to show their structure, but proved that vegetable anatomy might become a very interesting pursuit.—From the garden of the Society were plants of Erica Irbyana, Fuchsia racemiflora, Clerodendron fallax, Achimenes coccinea, and Begonia Dregii, together with Oncidium microchilum, and the rare Æchmea discolor, with beautiful crimson bracts or scales, out of which the pretty Violet blossoms grow. From the same collection were also cut specimens of Habrothamnus cyaneus, a new Mexican shrub, producing fine terminal clusters of deep porcelain-blue flowers. This species, although inferior in beauty to H. fasciculatus, is nevertheless a great acquisition to gardens. It is expected to prove sufficiently hardy for planting out-of-doors during the summer months; it will, however, require some kind of protection in winter. Along with this were likewise Cut Flowers of a new species of Lupine called L. pubescens, sent from Quito by Mr. Hartweg, having very downy leaves; and eleven plants of Fuchsia floribunda, a garden variety, showing the effects produced on that kind of plant by the use of different sorts of manures. The plants were all taken from the cutting-pan at the same time and potted into 32-sized pots. The compost used was peat and loam in equal proportions. Of the first three plants, which were the best, No. 1 received 1 teaspoonful of Harris's liquid manure in half a pint of water; 2, had half an ounce of apatite spread on the surface of the soil; and 3 had the same mixed in the soil. These 3 were nearly equal in every respect. Of the next 3, viz. 4, 5, and 6, the two first had each 1 oz. of charcoal, the one on the surface, the other mixed in the soil; 6 received half an ounce of superphosphate of lime mixed in a pint of water. These three were also nearly

equal, but were somewhat inferior to the first three. Other three, 7, 8, and 9, one of which received an ounce of cow-dung mixed in the soil, another a quarter of an ounce of phosphate of ammonia mixed in half a pint of water, the third half an ounce of superphosphate of lime mixed in the soil, were still inferior to the second three; and No. 10, to which one teaspoonful of Hallett's concentrated liquid manure was given in half a pint of water, was the least luxuriant of the group. Each of these substances was repeated on the 6th of July, and in order to give them a fair chance the plants were never repotted after they were taken from the cutting-pan. All these plants were larger and better than No. 11, to which nothing was applied, and with which the others were contrasted in order to ascertain the comparative merits of the different substances applied.

Garden Memoranda.

John Gray, Esq., Greenock.—The glass structures here, although in the town, are of a description which one would little expect to find in such a locality. They consist of a conservatory, a Coniferous house, a Camellia house, a large stove fifty feet long, twenty feet broad, and the same in height, a pit for Heaths, &c. fifty feet long, and an Orchidaceous house of the same size. The collection of plants is large, and includes many rare specimens. Mr. Clark, who is gardener there, pointed out in particular, an Acrostichum Alcicorne, 59 inches in diameter, being considerably larger than one lately noticed in a previous Number of the *Chronicle*.—*D.B.*

Bury-hill, near Dorking, Surrey.—A quarter of an hour's walk from Dorking, on the Guildford Road, through a pleasant neighbourhood, brings the tourist to the delightful residence of Mr. Barclay, at Bury-hill. The approach is through the park, with a wooded eminence on the one hand, and a fine open glade on the other; beyond this the eye ranges over a most beautiful prospect, in which Box-hill, with its white chalky surface studded with numberless—here crowded, there scattered—specimens of wild English Box, stands conspicuous. In front of the mansion, a broad lake spreads over a considerable surface, with several weeping Willows hanging gracefully over its indented margins, and near the centre, a small island crowned with a clump of closely planted Pines. The flower garden is beyond the house, not far removed from the border of the lake, and is neatly laid out with beds, gay with Verbenas, Heliotropes, and similar showy summer garden plants. Pleasant walks have been formed to wind up the wooded hill behind the house, and spaces have been cleared at intervals and devoted to Pines. Many of the Mexican and Himalayan Pines of recent introduction have stood the winter without protection, and without sustaining any harm, with the exception of P. Devoniana, and are now growing as freely as many of the more hardy kinds, several having made excellent shoots. The hill is covered with an exceedingly sandy soil; indeed in many parts near the summit it is almost entirely sand, and as the situation is likewise airy without being exposed to severe storms, it affords one of the best situations for growing plants that are scarcely sufficiently hardy to stand our climate generally. Pinus Llaveana, Teocote, oocarpa, leiophylla, pseudo-strobus, insignis, and many of the more rare species appear to succeed well. The grounds contain a considerable number of species, several of which are large and fine specimens. Abies Douglasii is above 30 feet high, and produced cones of perfect seeds last year.—*Q.*

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

HABROTHAMNUS* elegans. Elegant Habrothamnus. (*Greenhouse Shrub.*) Cestraceæ. Pentandria Monogynia.—The beauty of Habrothamnus fasciculatus is so striking that attention is strongly drawn to the discovery of other species in Mexico; and the Belgians have already succeeded in adding that now represented, which, although not comparable with H. fasciculatus, is evidently a graceful and gay-looking plant. We received fresh specimens from Mr. Van Houtte, Nurseryman, Ghent, in January last, and with them a coloured figure by Mr. Van Damme. We understand that the corolla is of a bright carmine. We have not seen this plant in cultivation in this country; but it is evidently a soft-wooded species, to be treated in the same manner as Pelargoniums. It differs from H. fasciculatus in its small bracts, and less conspicuous flowers, which moreover are smooth, not downy; from H. tomentosus in the shortness of the lobes of the corolla, the broadness of the leaves, the smoothness of the calyx, and the terminal, not lateral flowers; from H. corymbosus in not being destitute of hairs.—*Botanical Register.*

EPIDENDRUM RADIATUM. Ray-flowered Epidendrum. (*Stove Epiphyte.*) Orchidaceæ. Gynandria Monandria. Allied to both E. cochleatum and lancifolium, this pretty species is distinctly known by the round form and crisp margin of its lip, which moreover is almost notched out in the middle, and very delicately streaked with purple. Its petals too are both shorter and broader than in either of those two species. Its habit is precisely theirs; and the three, considering their constant flowering and very neat appearance, deserve a place in all collections. Besides, this species smells deliciously of Cinnamon. A plant of this, received from Mexico from Mr. Hartweg, flowered in the garden of the Horticultural Society. We also possess specimens gathered in that country on rocks, at the Hacienda de la Laguna, by Dr. Schiede. It should be potted in turfy heath-mould, mixed with small pieces of potsherds. During the growing season an ample supply of water should be given, and the atmosphere kept as moist as possible. In summer when the sun is strong, the house should be slightly shaded, in order to keep the temperature as near 80° by day as possible, without admitting much air. For a few weeks in winter little or no water should be given, providing the house can be filled with steam once a day.—*Botanical Register.*

CORETHROSTYLIS BRACTEATA. Rosy-armed Corethrostylis. (*Greenhouse Shrub.*) Lasiopetaleæ. Pentandria Monogyma.—This is one of the most striking of the Swan River shrubs, but owing to some difficulty in cultivating it, the specimens that have been produced in Europe are very inferior to the wild ones. In the latter the bracts are large, and of the most vivid rose-colour, thus rendering the bush indescribably gay; for the long loose clusters, adorned by these bracts, are produced in multitudes all over the plant. We entertain no doubt that when the habits of the plant shall have been more correctly studied it will become a general favourite. In the meanwhile it is as well to know that the foliage is very sweet-scented. A plant of it flowered last spring belonging to Mr. Groom of the Clapham Nursery. It succeeds best when potted in rough peat, well mixed with one-fourth silver sand. During the summer season a liberal supply of water should be given, and as much air as possible. In winter it should be treated in the same manner as Cape Heaths—never applying fire heat except to keep off frost. It may be propagated by cuttings in the usual way.—*Botanical Register.*

ANDROMEDA PHYLLIREÆFOLIA. Phyllirea leaved Andromeda. (*Greenhouse Shrub.*) Ericaceæ. Decandria Monogynia.—A very neat shrub, introduced lately by Messrs. Loddiges, with whom it flowered for the first time in January last. It was originally discovered in West Florida, at a place called Apalachicola, by the late Mr. Drummond, from whom we have a specimen. We place the plant, with Sir W. Hooker, in Andromeda, for these reasons. In the first place there seems no sufficient ground for separating from Andromeda the genera proposed by the Dons, which, to our apprehension, are neither limited by solid characters, nor so contrived as to form useful divisions. Secondly, the plant before us will not suit any of them exactly; so that M. Decandolle, who admitted the proposed divisions, although he thrust it into Pieris, a name in which he admits there is no common sense, does so with doubt, and questions whether it may not form a new genus of itself. For ourselves we cannot separate it from Andromeda polifolia. One of the most striking characters in this very distinct species is the peculiar darkness of its leaves, which thus are able to set off the snow-white flowers to great advantage. They look like pearls on a negro's neck. It is a pity that the plant should not be hardy, but of that we fear there is no probability. It is, however, probably about as hardy as a Pernettya, and capable of enduring the mildest winters in the open border. It requires peat-soil, and the same kind of treatment as Andromeda floribunda, like which it may be increased by layering, which should be done when the plant has finished its growth early in the autumn. It only requires the young shoots to be pegged down, and lightly covered with light sandy peat, and afterwards kept moist. The layers require two years before they are fit for removing from the mother plant.—*Botanical Register.*

* So named from ἀβρὸς, gay, and θαμνος, a shoot or branch, in allusion to the beauty of the species.

Miscellaneous.

Sophora Japonica.—The first tree which was introduced into France is still alive, in the Garden of Plants at Paris, in the ancient School of Trees of Tournefort. It is a single plant, produced from a seed sown in 1747 by Bernard de Jussieu, who received some seeds at that time from Japan. Five seeds of it were put under the care of the head gardener, the father of André Thouin; three of them grew, two of which were given away. This plant was called Arbor incognita sinarum until 1779, when it flowered for the first time. This Sophora is now about 72 feet high. The trunk, measured at 3 feet from the ground, is 2 feet 7 inches in circumference; the height below the branches is nearly 11 feet. —*Revue Horticole.*

Guano.—The island from whence the guano is taken, is about three miles from the shore, on the south-west coast of Africa. It is a barren rock, about a mile in circumference; has no soil, nor the least sign of vegetation. The guano lies to the depth of about 20 feet, and without any variation in quality. The continent is very sandy, and in high winds (hurricanes, for instance), will cover a ship's deck nearly 100 miles from the land. The birds on the island are a kind of penguin, and cannot fly to any distance, if at all, their wings being a kind of fin. It is believed that the captain of the vessel who brought the guano was the first human being who set foot on the island, which is very difficult to approach, there being no harbour, and a heavy surf. On walking on it, he could scarcely set his foot without treading on the birds, and they took no notice whatever of him, except pecking at his feet, he being barefoot; and on a gun being fired, they merely fluttered a good deal and made much noise. There is no fresh water, it is believed, for some hundreds of miles along the coast, and no rain. The importer, Mr. Rae, informs me, in a letter with which he has just favoured me, that his son is the discoverer of the guano islet or islets, for it would appear that there are several of them so remarkably situated. That he was led to go in search of them in the beginning of last year, from remembering having, when a boy at school, looked into the sea-journal of an American whaler, in which mention was made of such spots. And that his first attempt was unsuccessful, and nearly proved fatal to himself and all concerned—he and his boat's crew, in exploring the islets, having almost perished from want of water, before they could rejoin their little "surveying vessel;" and then (she, too, being in want of water), having had to sail 1500 miles before they could obtain a fresh supply.—*Dr. Davy, in the Edinburgh New Philosophical Journal.*

The Kestrel, or Windhover.—Of course the whole of the hawk tribe fall under the ban of the keeper. The species mentioned above is that which chiefly prevails in this locality, and whenever the gun can reach him, he is a certain victim. In addition, the nest is eagerly sought for, the young taken, and too frequently with a piece of wood chained to the foot, may be seen in misery hopping, as well as they can, to scare smaller birds from the produce of the garden. The utility this bird confers by the number of mice he destroys, is, of course, never taken into consideration; he is "varmint," as the keeper phrases it, and that is enough. His utility to the agriculturist, from his mice-destroying propensities, has been well described by Mr. Waterton. He is a feeder, also, on the cockchaffer, but all is of no avail, death awaits him whenever he comes within range. Those who have witnessed his beautiful action, when hovering over a field in search of his prey, cannot too deeply regret a course which, if persisted in, will ere long deprive them of this pleasure, at least in the neigbourhood of large game preserves. "Would but our country gentlemen," says the same entertaining writer, "put a stop to the indiscriminate slaughter of birds by their ruthless game-keepers, we should not have to visit Holland in order to see the true habits of the stork, nor roam through Germany to enjoy the soaring of the kite,—a bird once very common in this part of Yorkshire, but now a total stranger to it." A few evenings past the writer met a cottager, with an unfledged hawk and six goldfinches in a basket alive, which he was evidently bringing up for sale. In the other hand were six miserable sparrows fresh from the nest dead. "Ay, won't I kill all I can get near!" was the rustic's answer to a remonstrance on his cruelty.—*J. M.*

The Magpie.—This singularly beautiful bird is, unhappily, in the keeper's doomed list. But for its habits of extreme caution and sagacity, very few would survive the keeper's enmity. With perhaps a little truth in its reputation for depredation amongst a few partridges' eggs, and in all probability resorted to in absence of other food, this aberration is more than compensated for from the incredible number of grubs and slugs, lodged under manure in the pastures, which it destroys. In France and Sweden it is never molested; with the Norwegians they are especial favourites, and with a delightful feeling, at Christmas, that they should be partakers of the festivities of that season, a sheaf of corn is placed at the end of their houses for their use. How pleasant would it be if our rich farmers would thus distribute some of their grain for these beautiful birds, in imitation of this simple-minded peasantry.—*J. M.*

The Thrush.—First in our list is, we grieve to say, this early harbinger of spring; and, insensible to the benefits derived from the number of snails he destroys, wo betide him if he ventures to help himself to a solitary Cherry. During the prevalence of the unusual dry season (June 1844), the thrush was driven for food to the Holly-bush for its berries; and we grieve to record that 60 of this cheerful songster fell a sacrifice to the gun on a Sunday! In the next summer when wasps and other insects have full possession of the garden, this proceeding—the mixture of ignorance and cruelty—will bring its own punishment.—*J. M.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

MANY useful plants in that section which flowers in winter and early spring in the stoves, may be brought sooner into flower by checking their growth about this time; this is done by diminishing the usual quantity of water, and by keeping the house drier; others of the same sort may be encouraged to grow as late as they will, in order to succeed these. Every pot plant should be looked over one by one at any time when the weather is bad, during this or the next month. It is not enough, however, that the outside of the pots and the surface of the soil are cleaned over—the days for such gardening is gone by; the balls must also be turned out of the pots, worms looked after, the drainage relieved from the sediments which the summer watering has washed down among the crocks, and if the pot is at all covered with green slime, do not use it, but take a dry clean pot of the same size, then add a little fresh soil to the surface, of the same nature as that already in the pot. When a worm escapes from you in the operation of picking them, or when you suspect one to be in the ball, but cannot find it, mark the pot by putting a stick in it, and by turning out the balls occasionally, you will be sure to come at them some time.

Conservatory.—From this time to the end of October, there will be a good deal of potting for furnishing gaieties for this house. Tropæolum tricolorum and others should now be potted to come in in April. Lilium longiflorum and eximium—the latter only a slight variety of the other—to flower early in June, should now be potted; and also the beautiful varieties of Lilium lancifolium, to flower next July, should now be in pots; but October is time enough to pot all these, if they are not wanted before their usual time. By way of experiment, roots of all these and others should be kept back as long as possible, in order to have late flowers of them. The spring-flowering Cyclamens are very desirable plants; they should now be potted, and the summer ones gradually allowed to get dry, in order to be stored away for the winter; plants of this genus should always be marked with their names, as they are apt to be confused; and as some of them are at rest, while the others are in full growth, it may happen that they might receive wrong treatment. See Mr. Gordon's excellent papers on this family, vol. iii. 460 660. The earliest crop of Hyacinths, Narcissus, Tulips, &c., should now be making roots freely in the new pots, and very soon the whole host of Iridaceæ must be looked over and arranged for potting. There are few in this order that will do for forcing, but by potting some of them early in September, and others late in the autumn, their flowering season may be prolonged, and so with Oxalises. Oxalis versicolor and cernua are two that will stand any degree of forcing, and if potted now and kept near the glass in a stove or forcing-pit, they would be in bloom by the middle of March. The Oxalis cernua has flowers of as fine a yellow as those of the Alamanda cathartica. Violets must soon be potted and framed for forcing—look to what has been said about them in former volumes.

Pits, Frames, &c.—I have often heard it said that one cannot err in the treatment of plants if he follows the nurserymen's system with the different families, but this is an error. For instance, in the nurseries they are now busy housing many of their finest plants, but it is not too much to say that no plant which has been out of doors for the summer in gardens, should be housed till after the early frosts of October are over. Of course they must be temporarily guarded against frost and beating rains; this is, therefore, the time when waterproof transparent coverings are most useful. There is a new description of pits altogether, wanted for this time of the year—say from the middle of this month until Christmas, according to the season. Brick or turf pits are wholly inapplicable for this season, comparatively speaking. We want skeleton frames for the purpose, that will let in the wind from every point of the compass, and that will exclude rains and dews at pleasure. They should be also so contrived that the sides and ends may be shut up quickly, and be close enough to exclude 8° or 10° of frost. There is nothing now in general use that will suit nine-tenths of our greenhouse and half-hardy plants so well as a skeleton frame or pit, at the beginning of winter.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

Few plants make finer beds, or are more to be depended upon in all seasons, whether wet or dry, hot or cold, than the old species, and some of the varieties of shrubby Calceolarias. C. viscosissima, with its flowers of deep orange, though by no means so plentiful as it ought to be, is undoubtedly the most beautiful of the class. It is rather difficult to strike by cuttings, unless when caught in a proper state, and that is when the young wood is a little more than half ripe, at which time they strike freely, if plunged in a gentle bottom heat. A hybrid variety, raised from the above by a friend of mine, is not less interesting, being equal in colour, and destitute of that clammy ness of foliage from which C. viscosissima derives its name

C. integrifolia, with large yellow flowers, and C. i. angustifolia, with rather paler flowers, are both free-growing and very useful kinds; and C. rugosa, with smooth-surfaced leaves, is not less interesting. These are the best of the old yellow and orange kinds; but there are some hybrid varieties raised, which make tolerable beds, though they are not so much to be depended upon as the preceding sorts. These are Cleopatra, Sultana, Harlequin, Indian Chief, Stewartii, and one or two others. All these strike freely at the present time. The old Ageratum grandiflorum and mexicanum are both excellent plants for beds, and may be increased either by seeds or cuttings, though the latter are preferable. Of Lobelias, L. Erinus and gracilis are both very pretty, but are nevertheless so inferior to L. azurea as to be scarcely worth cultivating; cuttings of these are rather difficult to procure at this season, but a few plants taken up and potted will produce abundance in the spring.

Reserve Garden.—Stocks sown in the beginning of August will now be of a fine size for potting off. Fill the pots with good open compost, not too rich, and put two plants into a large 60, or three into a small 48-sized pot. They should afterwards be placed in a frame, and shaded until they are established.

Pits and Frames.—Continue to propagate plants as fast as possible; and if those that are already rooted can be hardened off, so as to have a fortnight or three weeks' exposure before they are housed for the winter, it will be all the better for them. —*W. P. A.*

III.—FLORISTS' FLOWERS.

Polyanthuses.—If seedlings are not planted out, let it be done without delay on a shady border, so that they may be well established before winter. The offsets, both of these flowers and Auriculas, will require regular watering and attendance during the dry weather. *Tulips.*—A rapid advance is taking place in public opinion with respect to these magnificent flowers, and the properties constituting a perfect flower are much better understood. Lose no time in getting in fresh and good varieties; if flowering-bulbs are not to be had, procure offsets—they will grow bigger, and a bloom from a maiden root will often prove cleanest. We have heard a high character of a feathered seedling Byblomen, raised at Halifax, called "The Queen of the North;" it is said to be first-rate. Of this we are glad, as it is a scarce class. We also want fine-feathered Roses, and should be glad to travel 50 or 100 miles to see one better than "Lady Middleton." *Carnations* —Let the rooted layers be put singly in pint pots; where the stock is large, it is usual to have two in each; water very sparingly, without touching the foliage or Grass, and place them in a close frame for a few days, till they get fresh root. *Pansies.*—Prick out seedlings as they get large enough to handle. *Dahlias.*—Good occasional waterings with liquid manure will prove highly beneficial. Thin the buds, and tie up regularly; keep a sharp look-out for earwigs. Cuttings may be struck in heat.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—Let plants swelling their fruit be properly supplied with liquid manure, and syringed on closing the pits after sunshine. Presuming that the necessary arrangement of the plants for the winter is by this time complete, it is necessary to pay strict attention to the keeping a regular bottom-heat of about 85°, to give proper ventilation on all favourable occasions, and gentle syringings on shutting up the houses in clear weather. Be careful to shade during the heat of the day all plants not well rooted and in a growing state. This dry weather affords an excellent opportunity for laying up soils for future use, and if not done, this very important part of a Pine-grower's business should no longer be put off. For further suggestions on this head, see page 575.

Vineries.—Shade during hot weather all Grapes that are ripe, to prevent their losing their plumpness. This is the first time the idea has occurred to me of shading ripe Grapes, and some may say "How unnecessary!" or perhaps "How ridiculous!" Nevertheless, I consider it is equally important to have fresh plump Grapes through the winter till March, as to have new ones in March or April; and when the fruit has had enough of the Vine, and is sufficiently ripened, I feel convinced that it will keep much better, if shaded from the withering effects of a clear sun. Remove the loose rough bark from the pruned Vines, and after washing them well with soft water, anoint the whole of the Vine with a mixture of soft soap and sulphur, with warm water, in the proportion of ½ lb. of soap and ¼ lb. of sulphur to 2 quarts of water. Rub it into every crevice with a sponge, going over the Vines twice or thrice.

Peach-house.—Continue to wash the foliage of the trees in the late house, and give all the air possible, by letting the top lights well down, and opening the front ventilators and doors. Proceed with the operations recommended before for the early house; and if the top lights have not been removed before, they may now be taken off to keep the house as cool as possible.

Fig-house.—See former Calendars.

Melons.—Endeavour to turn the present fine weather to the best account, by giving plenty of air, shutting up early, and keeping the foliage regularly thinned. On cold nights make a little fire, or keep up the heat by linings.—*G.F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Peaches and *Nectarines* should now be looked over every day, and the fruit gathered before it is dead ripe. If placed on shelves in the fruit-room, with soft tissue or silk paper underneath them, the flavour will be better than if allowed to hang too long on the trees. After gathering what fruit was ripe, the trees might be sprinkled with clean water in an afternoon after these fine days; but unless in extreme cases it would not now be advisable to water any more at the roots, as the sooner the growing system can be stopped, and the maturing process completed, so much the better. If the heavy autumn rains, which we may expect before long, could be thrown off the borders by tiles puddled with clay, or by boarding, &c., we should suffer less from severe winters. If the borders have been allowed to get dry in July and August, and are deluged with rain in the latter end of September and October, unless the borders are particularly well drained, a second growth will take place, the vessels of the wood will be charged with a superabundance of watery fluid, and if a severe winter ensues, black and brown-spotted, cankered, gummy, and dead wood in the spring will be the consequence. Some Apricot-trees are having their leaves slightly dotted with mildew, but instead of watering at the roots, the leaves might be syringed with sulphur and water.

French Beans.—Measures should be taken for protecting the last sown out of doors in case of necessity: one night's frost warded off may ensure a supply for a month later. Where hoops and mats are not applicable, a shaggy straw rope fixed upon stakes, so as to be moved obliquely or horizontally as occasion requires, will answer the purpose. *Onions* should now be got up and dried in the sun, until the stems are thoroughly withered. There is no better method of preserving them than stringing them, and hanging them against a wall, or over a pole, where they will be safe from frost. A decayed one may easily be picked out; and the root ends may be burned with a hot iron in a wet day, to prevent them growing early next season. *Mushroom-spawn.* — Those who grow Mushrooms only at certain seasons cannot do better than procure it from their nurserymen, who generally obtain it from those who make it extensively for sale. Where Mushrooms are constantly wanted, the gardener can use the spawn more liberally, when he makes a quantity himself. I am not at all particular about the materials; horse-droppings and cowdung, in about equal proportions, with a little road-drift, well mixed together, answer very well. It may be made into bricks with a mould, and put in a shed to dry, or merely spread out on any hard place under cover about two inches thick, and divided into the size of bricks by cutting with a sharp edging iron. Make two holes in each brick for spawning, and getting them dry enough for that operation is all that will now be required. *Celery.*—The first crop is beautiful this season, owing to there being no rain to rot the centre of large heads. Give succession-beds a good watering before earthing them up. *Routine.*—As in former Calendars. —*R. F.*

ERRATUM.—For "Fingarth," in last week's Calendar, under this head, line 21 from top, read "Tingarth."

VI.—ARBORICULTURE.

Old Woods.—Where planting is to be done in the ensuing season, the ground should now be trenched and holed for the purpose.

Coppice.—Attend to growing shoots before boisterous winds and wet weather commence; secure them from being broken. Fill up vacant spaces, so as to have all the ground cropped. Trench, hole, and drain the land, if necessary, before the planting season arrives.

Young Plantations.—Preparation for planting, and making good all failures in last season's planting, should be forwarded with all expedition. In all light dry ground, early autumn planting should be preferred; but in all cold, stiff, wet land, spring is the best time for the operation.

Hedge-rows.—Dead plants of last season's planting should be taken up, and the holes left open and ready for filling up with fresh plants as soon as the season arrives.

Nursery Work.—Hoeing, weeding, and training young shoots of the present year's growth, is the principal work to be attended to here at this season.—*W. B.*

VII.—COTTAGERS' GARDENS.

Although there is everywhere an abundant crop of Grapes this season, yet in consequence of the bad weather we had in spring, they will be late in ripening, and will not on that account be so well flavoured. The shoots should be kept closely fastened in, so as to receive the full benefit of the wall, not only for the sake of bringing the fruit faster to maturity, but also for thoroughly ripening the wood intended for bearing next year, before winter. It will also be advisable to go over the Vines again, pinching off the laterals, and removing all useless growth. Gather and store Apples and Pears as they ripen; on dry days too much care cannot be taken to prevent bruises, and be sure also that the kinds are ready for gathering. A good way of ascertaining this is to divide one; when, if the seeds are brown, they may be gathered. A few Lettuces and Endive planted out now in a favourable situation will be strong good plants by November. A plantation of Cabbages may also now be made; plant them one foot apart as for Coleworts, and in spring every intermediate row may be drawn out for use as Coleworts, and the remainder left to form hearts for Cabbage. Do not omit to attend to growing crops; keep them free from weeds, and in dry weather draw a little earth to them as they advance. All decaying Annuals should be removed from the flower-border, and let everything about the cottage be as neat as possible.—*J. McH.*

State of the Weather near London for the week ending Sept 5, 1844, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

BALSAMS.—*O.*—The following are desirable sorts, viz., Double Lilac, Double White, Rose White, Scarlet, Scarlet Flake, Red Flake, Purple Flake, Mottled Purple, Mottled Red, Mottled Scarlet, and Purple.§

BEES.—*E. F.*—Of the Bees sent all were furnished with stings, except one. The cause of their death apparently is want of food. Although you state that there is no appearance of any robbery going on, we imagine that if you watch attentively you will find that such is the case. We were shown a hive lately under similar circumstances, the honey of which was nearly all carried off by intruders, and many of the inmates were in consequence in a weak and dying state. ‡

BOOKS.—*A Dupe.*—Mr. Hoare's work on the Vine is under consideration.——*W. R. S.*—There is no small book published exclusively on the subject you mention, but much of the information you want is to be found in "Harrison's Floricultural Cabinet." ¶

HEATING.—*V.*—If you use back ventilators you cannot employ them in a north or north-east wind. We much prefer ventilators in the roof or at the sides. Your south aspect is no disadvantage, and we would not go to the expense of moving the house. With moveable sashes in the roof, and sliding sashes at the sides, you will have all the air you *can* want. If you adopt the Polmaise system we shall hope to hear the result. Of this you may be sure, that if you can conveniently make the inside fittings of sandstone, or some such soft material, it will be far better than wood.——*An Irish Gardener.*—Put one flow and one return-tank in your pit, and one flow and one return 4-inch pipe round your house. Have the pipes cast with evaporating pans on them, which you can use or not at pleasure. Leaves may be placed on the gutters; but do not use sawdust, which is a very bad material. You may have the boiler partly inside the house if you like; in that case have an evaporating pan on the top of it. If you use calico it should not have a less pitch than glass; mind however and do the work well, or the calico will wear out. You should read what has been said on this subject in many former Numbers of this Paper.

INSECTS.—*R. Kinghorn.*—The Pear-trees are attacked by the larvæ of Tinea Clerckella: you will find their economy, and the best modes of extirpation, in the 1st vol. of this Journal, p. 261. *R.*——*W. Joss.*—The Caterpillars feeding on the Fir-trees are the larvæ of a Saw-fly, possibly the Lophyrus Pini, figured in Curtis's Brit. Ent., pl. 54. Please to send Mr. Curtis your address, as he wishes for more of the larvæ or pupæ, to rear them and ascertain the exact species. *R.*——*A. W.*—The Grubs you complain of are the offspring of the Noctua exclamationis, whose history will shortly appear in this Journal. You will find hand-picking the best remedy. *R.*

LAWNS.—*J. A. B.*—To improve your lawn the first thing is to grub up all the weeds and very coarse Grasses, the next to throw down seeds of the Crested Dog's-tail, Meadow Poa, and Sheep's Fescue Grasses, with a good supply of white Clover, in all the bare places. Then, next spring, you should give it a good top-dressing of soot, with which you may mix a small quantity of guano, and about ¼ cwt. of salt per acre. We never give prices except in our market returns.

MANURES.—*A. Walton* will obtain the information he asks for at p. 571 of this year.‡——*Bobadil.*—If sawdust is thoroughly soaked with urine it may do for coarse purposes, provided it is not fir sawdust: but it is a bad material. You had better burn it and use the ashes.

MELONS.—*A. B.*—Drought, in conjunction with the Red Spider, have caused the destruction of your Beech-wood Melons.

MUSHROOM SPAWN.—*W. P.*—We dare say your spawn is good, but that can only be ascertained by trying it. There is some advantage in having it in cakes of a known size instead of bricks; and we think with you that it is a convenience to the buyer.

NAMES OF FRUITS.—*A. B.*—Peaches: 1, Noblesse; 2, Royal Charlotte; 3, Grosse Mignonne; 4, Late Admirable. The Nectarine is the Violette Hâtive. ¶——*M. D.*—Your Plum is the Blue Perdrigon. ‖——*W. Heale.*—Your "Hybrid Plum," between the Green Gage and the Orleans, is at least equal in quality to the Washington Plum, which in other respects it very much resembles. It well deserves cultivation. ‖——*G. B.*—No. 163, Coe's Golden Drop; 237, appears to be the Blue Perdrigon; and 219, probably the Fotherigham. ‖——*A. B.*—Fulham, No. 1, Williams's Bon Chrétien; 2, Reine des Poires; 3, Passe Colmar. ‖

NAMES OF PLANTS.—*A Reader.*—Bignonia grandiflora. The little bulbs on Achimenes pedunculata will grow and make young plants.——*Semirusticus.*—Such galls on Rosa canina are not very uncommon.——*J. B.*—Quamoclit is the Mexican name of the plant.——*A Reader.*—Viscaria oculata, Nemesia floribunda, and Schizanthus retusus; your new scarlet Silene we do not know.——*A. B., Fulham.*—1. Begonia Evansiana. 2. Gloxinia maculata. 3. Niphœa oblonga.§——*A. Campbell.*—Crushed to pieces; appears to be Bifrenaria vitellina.——*T. S.*—Bryum punctatum, by no means scarce in some parts of the country.§——*T. Davidson.*—Ipomœa, now called Quamoclit sanguinea.——*G. D. K.* A pretty variety of Pentstemon Campanulatum.——*A. T.*—Apparently Ipomœa Quamoclit, which never attains a large size. I. rubro-cærulea would suit your purpose better.§——*F. T. Foljambe.*—Figured in Bolton's "Fungi," t. 116, under the old name of Lycoperdon cervinum.

OXALIS.—*O.*—These thrive well in almost any light sandy soil, such as peat or leaf-mould. After flowering, they naturally lose their foliage, when they should be kept dry for a few weeks. As soon as they show symptoms of growing, they should be repotted, and placed in a greenhouse; but let water be sparingly given until they begin to show flower. They may either be multiplied from seed, or by dividing the bulbs which they generally form above their roots.§.

PANSIES.—*W. R. S.*—These will be quite strong enough to stand the winter if planted out when the weather becomes moist, towards the end of September or the beginning of October; but they must not be planted either in very rich soil or in a damp situation.¶

PEACHES.—*Aliquis.*—Noblesse and Royal George are the two you should take. We conceive it is quite practicable to force Peaches in boxes.

PEAS.—*C. E. F.*—The True Early Frame and Early Charlton, are recommended for the earliest crops. In succession, the Auvergne will fulfil most of the desirable properties you enumerate. ‖

WASPS.—*J. N.*—Your mode of destroying these insects is the old and inconvenient plan. If you will try turpentine you will never again have recourse to so clumsy an expedient as gunpowder.

WHITNEY'S COMPOSITION.—We have received from Mr. Whitney some Black Hamburgh Grapes grown under his calico sashes, and we can state that they are perfectly well coloured, and good berries. Mr. W. states that the average weight of the berries was 140 grains, and that the foliage is "particularly beautiful."

MISCELLANEOUS.—*C. B.*—You will find many plans of Icehouses in our columns. We do not give estimates; that is the business of a builder.——*E. S.*—Nos. 10, 22, and 43, may be had at the Office. 45, and 52 are out of print.——*Juvenile Botanist.*—We know of no precise distinctions on which orders, genera, species, and varieties, are founded; nor is there in any publication a brief and clear definition of their differences. The common definition is this:—A species is a collection of individuals which were originally created distinct from all others; a genus is an assemblage of species more like each other than anything else; an order is a similar collection of genera; varieties are accidental forms of species.——*Delta.*—Wistaria consequana is the plant more generally called Glycine sinensis, with which you are doubtless well acquainted. We know nothing of W. floribunda. W. Frutescens is like the first, but very inferior in every respect, and not worth growing except as a variety.——*R. G.*—We saw the paragraph, and wrote to Mr. Grimstone about it, to inquire if it was true. As we have received no reply, we presume the story to be a misrepresentation.——*A. B. O.*—It is true that deformed Cucumbers are frequently preferred for seed. The reasons are, that they are less fit for table, and contain more seed. Their accidental deformity does not impair the quality of the seed.——*L. N. G.* will find a select list of Conservatory plants and climbers given at pp. 340 and 392 of the present year.‡——*A Quiet Observer.*—The description of the Flower and the report of the Coppice Show was by different persons. You had better apply to Mr. Lodge.——*South Lambeth.*—Both Picotees and Carnations are derived from one common stock, the Dianthus Caryophyllus. Which was obtained first we do not know.——*A. T.* will find a list of Roses given at p. 773 of last year.§——*O.*—A good sort of Vegetable Marrow is Courge à la Moëlle of the French.§

SEEDLING FLOWERS.

FUCHSIAS.—*W. L.*—Both your seedlings are bright and rich-coloured flowers, but wanting the violet colour in the corolla; there is no novelty about them, nor can they be distinguished from many others we daily see.*——*Y. L.*—Nos. 5 and 9 are large flowers, but the tube and sepals in both are coarse, and they are no improvement upon sorts already out. No. 8 is superior to the other two; tube and sepals of a finer quality; the latter curl up, exposing the entire corolla, which is crimson, with a tinge of purple: this is the largest and most showy flower of this character we have seen.*——*H. C.*—Your seedling is a very pretty variety, delicate in colour, moderate in size, and good in form; tube and sepals of a very delicate pink colour, the latter tipped with green; corolla well exposed, of a peculiar rosy colour, having a slight tinge of violet; it will form a desirable variety in a collection, if the habit be good.*——*L. N. G.*—Your seedling is very large and showy, but you have sent an imperfect bloom, so that it is impossible to judge of the corolla; we fear this part of the flower is deficient.*

PANSIES.—*M. T.*—It is difficult in the present day to raise seedling Pansies that will rank as first-rate flowers. Among your seedlings there are, of course, different degrees of merit; they generally possess good qualities, very seldom fail in the eye, which is an important part; the side petals meet above the eye, with the colour and form good also; but generally they want the size and substance of the flowers we are in the habit of seeing at Exhibitions. The inferior sorts sent are Nos. 1, 3, 6, 7, 8, 9, 10, 11, 12, 14, 15, 16, 19, and 21; those possessing good properties, but rather under the standard size, are 2, 4, 5, 13, 17, 22, 23, 24, 27, 28; and 10, 18, 20, 25, are fine in size and substance.*

SEED-WHEAT. — Any one desirous of obtaining Seed-Wheat for use this autumn, may ascertain, by application to me, the particulars of the crops of two excellent varieties—Shirreff's Hopetoun, and Morton's Red-Straw White, which have been grown on WHITFIELD FARM, THORNBURY, GLOUCESTERSHIRE, during the last 3 years. This year's crop is on sale at 8s. a bushel. —JOHN MORTON, Whitfield.

The Agricultural Gazette.

SATURDAY, SEPT. 7, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

FARMERS' CLUBS.

Sept. 10 Abergavenny.
Sept. 20 { Debenham. Stoke Ferry. Wrentham.
Sept. 21 { Gloucester. Cardiff.

BEFORE proceeding further with our papers on Agricultural Mechanics, we must place before our readers the following remarks by a correspondent on the subject of our last week's Article, THE DRAUGHT OF FARM IMPLEMENTS :—

"If I understand your plan aright, you intend to describe the construction of each of the machines you notice—1st, in reference to its efficiency; and 2dly, as affecting the power required to work it. The first of these subjects has but few general bearings. To be sure, in entering upon the consideration of implements of cultivation, you might have prefaced your observations by an inquiry into that condition of soil to be produced by their combined action which is most suited as a seed-bed, or as a vehicle for conveying nourishment to the roots of full-grown plants. This, however, you have preferred postponing; but the subject of draught is one affecting farm implements generally, and it is one of great interest and importance. Your descriptions and illustrations of the means we have of measuring it are satisfactory and well-placed; but, with the exception of a few sentences on the want of constancy in the density of soils as producing an extreme variability in the draught of all implements of cultivation, your remarks on the subject have not that general bearing which they might possess. In order, therefore, that your introduction to the subject of Agricultural Mechanics may not be characterised by any glaring incompleteness, will you allow me to make a few further remarks on the draught of farm implements?

"I do not allude to the means of draught—the sources of power employed—the economy, in certain cases, of using steam-power—the comparative expense of horse-labour, and that of oxen—a subject, by the way, highly worthy of discussion in your columns; nor do I allude to the variety of the methods adopted in arranging the cattle before the implements they are to draw—as in *tandem* teams, *unicorn** teams, and teams of two or three horses abreast. The merits of these various modes of arrangement must be determined almost solely by a consideration of the facilities they severally afford for enabling the horses advantageously to apply their strength; and a slight consideration—though I do not intend entering upon it now—will, I think, point out the superiority to all others of the mode of harnessing cattle abreast. There are farmers, however, who defend their practice in this particular, upon the assumed safety it affords against injury of the ground by trampling. Reasoning of this kind must be fallacious, because, if two teams be of equal number, for every furrow that is opened, the same number of horses must walk across the field, whatever be the mode in which they may be harnessed to the plough. The only possible distinction in this respect between two 2-horse teams, the one abreast and the other tandem, is, that while the trampling of the latter is all in the furrow, and tends to the production of a hard pan or bed a furrow's depth from the surface, that of the other—as I think, less liable to be injurious—is partly in the furrow and partly on the unturned land.

"In the remarks, however, which I have asked permission to make, I allude more particularly to the mode of harnessing cattle—be they horses or oxen, one or more—to the implement at work.

"In the above figure it will be seen that the draught-chain of the plough, instead of proceeding in a straight line from its attachment at the hames to the plough beam, makes an angle at the back-band between those points.

"The back band is in fact so short that it carries the chain level from the point of its attachment to the collar; and thus, as I may incidentally mention, it constitutes a simple mode by which the ploughman can alter the line of draught. If the plough tend to work into or out of the ground, it may, by causing the horses to pull it in a more upward or in a more horizontal direction, be caused to 'swim fair' at the desired depth; and the back band, by being shifted backwards or forwards, evidently affords the means of altering in either way the direction of the line in which the effort of the animal is to be exerted.

"But the chief merit of this simple arrangement is, that it takes a portion of the draught from the shoulders, on which all of it formerly fell, and brings the muscles of the back into play. There are several advantages derived from the use of this back-band; the bringing of the back of the animal into work increases its capability as effectually as if a new source of power were called into action, and not only so, but the arrangement by which both shoulder and back are made to pull, tends to compress and force together the acting muscles of those several parts, and thus to produce that firmness and rigidity of its parts, which must give the horse additional confidence in its own powers. The arrangement of draught harness upon draught animals is thus a matter of considerable importance; and as it is equally so, whatever be the implements at work, I thought these remarks upon it would be properly in place at the commencement of your Articles on the Machines of Agriculture.

"It is a very general and probably accurate idea, that power, to be advantageously applied, should be near the work to be done; though how to explain satisfactorily the advantage which appears to arise from this practice, I do not know. The only two apparently influential causes in producing this effect, viz., the additional weight of draught chain to be carried, and the indirect application of the animal's power owing to the slight additional bending of the line of draught consequent upon lengthening it, appear insufficient to account for it. Be this, however, as it may, the advantage of the [illegible] harnessing that I have been describing, [illegible] to justify the slight increase which it makes [illegible] woodcut) in the distance of the horse from the implement it is drawing.

"It is no small advantage of the system of harnessing draught-cattle abreast, that it affords an opportunity for the adoption of this simple mean of so materially assisting the effort of each of the animals in the team, taking it from the few muscles which are brought into play by resistance to a pressure on the shoulder only, and distributing it more evenly amongst these and others."

To this we have only to add, in proof of the importance of a right way of harnessing cattle, that, though in working most Scotch threshing-machines an arrangement is made by which the effort of no horse can exceed a pull of 10 or 12 stones in weight, while in ordinary plough-work a pull of 15 and 20 stones is often exerted, yet the work at the threshing-machine is universally considered the more severe upon the animals: the reason, so far as we can see, being that, in the former case the resistance to be overcome being all above them, no such advantage as has been here stated to arise from the use of the back-band can be experienced.

A THIRD edition has been lately published of the excellent pamphlet by Mr. H. Davis, ON THE WASTE OF CORN IN THICK SOWING; and we take the opportunity of noticing it, in order at the same time to publish the results of an experiment on the proper width of drilling Wheat, to which we have before alluded (p. 413). A 10-acre field was divided into various lots of nearly one width, and sown with Wheat in November last, the drills being at intervals of 6, 9, 12, 15, and 18 inches respectively. The soil is minerally uniform as regards the width of the field, but it varies in its character longitudinally. It is a sandy loam upon the old red sandstone formation, and, about two-thirds of the way down the field, a bench of rock—the pudding-stone or conglomerate—juts out to near the surface; below this, the rock resting on the clayey member of this series, a series of springs occur, and formerly the land had been so "served out," to use a homely expression, by the watercourses and ditches, &c., connected with these springs, that the operation of draining and levelling, having now been completed, the soil is as variable and patchy as it is possible to conceive. This portion of the field, therefore, as well as that where the soil is shallow, has been excluded from the following calculations. In the month of July two lines, parallel to one another, and 5 chains apart, were laid out across the field, including between them the greater portion of the upper part of it, the soil of which, so far as the farmer can judge, is of a perfectly uniform character. The plots, being about one chain wide, thus consisted of about half an acre each. To this, however, an exception must be made; the land on the south side of the field, having been pared and burnt the previous year, and otherwise differing from the rest of it in the management it had experienced, was excluded from consideration in determining the results of the experiment, and therefore the plot on that side, though of the same length as the others, was only 7 yards wide. There were thus, on walking across the field from south to north, seven experimental plots. On No. 1 the Wheat was drilled in rows 9 inches apart, the seeding being at the rate of 6 pecks per acre; on No. 2 the rows were 18 inches apart, and the seeding three pecks an acre; on No. 3 the rows were 6 inches apart, and the seeding 9 pecks an acre; on No. 4 the rows were 12 inches apart, and the seeding 4½ pecks an acre; on No. 5 the rows were 15 inches apart, and the seeding 3⅗ pecks per acre; on Nos. 6 and 7 the rows were 9 inches apart, and the seeding 6 pecks per acre. The land last year grew Swedes, of which it yielded a fair and uniform crop.

We are thus careful in detailing the particulars of this experiment, in order to secure ourselves from what experimenters on any point in Agriculture are peculiarly subject to—a liability to mislead others; and still further to insure an accurate appreciation of this experiment, it must be stated that the weather has, during this season, been one of almost unparalleled drought—one, indeed, in which thick sowing was advisable, if ever it has been so. We must say generally of this experiment, that its extent, the character of the soil, and the general attention which has been paid to secure its accuracy, has all along given us confidence in its results, whatever they might be—a confidence which, if nothing existed to impair it before, cannot of course be surrendered now that the results are known. With the exception of one point which became evident before harvest, viz., the general superiority of the crop on the north side of the field over that sown at the same width on the south side of it, we know of nothing to hinder us from believing that on [illegible] siliceous sandy soils in good condition, with such a [illegible] as the present has been, the following results of this experiment would [illegible] generally experienced.

No. of lots.	Width of rows	Grain per acre.		Straw per acre.	
	...ches.	bshls.	lbs.	tons	cwts.
1	9	[illegible]	[illegible]	2	[illegible]
2	[illegible]	[illegible]	54	2	[illegible]
3	6	38	0	3	3
4	12	36	52	2	2½
5	15	[illegible]	[illegible]	[illegible]	[illegible]
6	9	43	50	[illegible]	[illegible]
7	9	46	3	2	15½

* These were calculated from the yield, carefully weighed and measured, and from the size of the different plots accurately measured. Excepting No. 1, the plots differed but little in size, and averaged half an acre each.

No mention is made of tailing Corn, for the simple reason that there was none. The grain was all large berried and plump, weighing rather more than 64lbs. per bushel. There was a few *pugs*, as they are provincially termed, *i. e.* berries unseparated from their husks, amounting, perhaps, to one bushel in sixty; these were not separated before weighing, but on afterwards separating them by sieve, there appeared to be more where the grain was sown thickly than in the other plots, probably owing to the produce being riper there, and the husk thus more readily breaking off along with the grain in the threshing.

What inferences are to be drawn from this experiment? The appearance of superiority in the crops on the north side of the field has been fully borne out by the result; and in point of fact there is a much greater difference between two of the plots (Nos. 1 and 7) in which Wheat was sown in equal thickness, than there is between two plots (Nos. 2 and 3) in which the Wheat was sown in thicknesses differing most from one another. However, no great error can arise from comparing adjacent plots; and let any advocate of thick sowing compare the produce of the 18-inches-drilled Wheat with that of the 9-inch Wheat on the one side, and that of the 6-inch Wheat on the other, and say if, considering the drought of the season, he is not surprised at the slightness of the difference between them—a difference so slight that it is almost compensated by the saving in the seed.

May we presume that the superior fertility of the north side of the field is the result of a *uniformly* increasing superiority of soil as we walk across it from south to north? If so, then substracting the 9 bushels and 50 lbs. from No. 7—the amount in which it exceeds the produce of plot No. 1 sown equally thickly—8 bushels and 10lbs. from No. 6, 6 bushels and 32lbs from No. 5, and so on uniformly

* A provincial term, descriptive of a 3-horse team, 2 being abreast, and 1 in front of them.

decreasing to 0 as the amount to be subtracted from No. 1, we obtain the following results:—

Number of Lots.	Width of rows.	Grain per acre.
	inches.	bushels. lbs.
1	9	36 50
2	18	34 14
3	6	34 47
4	12	31 56
5	15	33 39
6	9	35 40
7	9	36 50

If this be a justifiable step in estimating the results of this experiment—and from the manner in which it assimilates the produce of the plots which were sown equally thickly we may presume that it is—then, though the weather has been such as most remarkably to favour thick-sown crops of all kinds, yet it has not been sufficiently dry and scorching to hinder the plants of plot No. 2 from as nearly as possible equalling in produce those of plot No. 3, though not, by two-thirds, so thickly planted in the ground.

The subject of the quantity of seed per acre from which the maximum benefit is derivable, is one of great interest to the farmer; the seed-Wheat alone of many farms equals a quarter of their rent in value, it is a subject which we hope to see taken up by many of our practical readers. We have this week received an interesting account of experiments performed last year near Bath, which we shall publish in our next Number, and we hope that the experience of others will be placed at our disposal, in order that from the comparison of numerous results a trustworthy conclusion may be arrived at.

We conclude by quoting from Mr. Davis's pamphlet the following defence of the practice of thin-sowing Wheat. His practice on the large scale is to sow but 3 pecks per acre.

"The yield of an average ear of thick-sown Wheat is about 30 grains (I say thick-sown, for thin-sown yields very much more), and therefore, as the ordinary return off every acre is at most about 30 bushels, it follows that this quantity, no matter how much has been sown, can at most have come from the growth of the ears from one bushel of seed (and that, too, is allowing only *one* ear to grow from each grain, and 30 grains from an ear). This being the fact, of what use can more seed be, or rather let me ask, must it not prove injurious [illegible] becomes of the remaining six or eight pecks of seed which are commonly sown; and how is the excess of plants, thereby produced, to be gotten rid of without injury to the remainder? In allowing one ear only to grow from a grain, and each ear to contain only 30 grains, I am very far from taking what should be the produce; for a single grain, having room, will throw up 10 or 12 ears, and these ears will each contain from 60 to 80 grains, so that in fact the yield, were room given to each seed to tiller out, instead of 30 for one, which is all a bushel of seed allows, would be many hundred-fold; and hence any provision for the loss of seed from vermin or birds is unnecessary, for supposing half, or much more of my small allowance, to be taken away or destroyed, the deficiency of plant will be immediately met by the tillering and the larger size of the ear, which takes place wherever room admits of the increase. Among the many proofs I have had of the advantage from thin sowing, the following is a striking and, among my people, well-known fact. In the autumn of 1840, I had to sow with Wheat a field of eight acres, and to do this seven bushels of seed were given out, but owing to an error of the drill-man in setting the drill, when he had sown half of the ground, he found he had not put on half of the seed; then that I might not discover, by the overplus, his mistake, he so altered the drill as to sow the rest on the remainder of the field, and in this way one half had little more than two pecks to the acre, whilst the rest had nearly four pecks. I did not know what had been done, and was therefore surprised and frightened in the winter by finding part of the field very thin, and, had not the rest looked very much better, should have ploughed it up; but in spring and summer, a decided superiority in the growth of the thinner portion became perceptible, and at harvest this part proved the best, and I should never have known of the error in the sowing but for this result having induced the drill man to point it out to me."

It is only by experiment and observation, whether of a designed or accidental, but especially of the former character, that truth in the matter can be ascertained.

ON FLAX-SEED AS FOOD.

(*Continued from page 594.*)

EVERY farmer is aware of the value of oil-cake as food for cattle, which is merely the refuse matter of Flax-seed after the expression of the oil. Indeed, such a nutritious article of food has this been found, and so much superior for the production of fat to any article of farm produce, that animals fed on it have usually been disqualified from competition at the national and local farming societies' Shows. But much valued as it has hitherto been, there is good reason to believe that it would have been still much more valuable were it free from adulteration. Flax-seed, like every other article of farm produce, is very various in quality; so that strict uniformity in the quality of the oil-cake produced from it, is not to be expected. The variation will, however, be greater in the quantity and quality of the oil than in that of the cake; so that, were no means employed for adulteration, the quality of the latter would be found more uniform than it usually is; nevertheless, in nine-tenths of the oil-cake exhibited in the British markets, the refuse of other seeds, frequently those of weeds, will be found to constitute a large if not the greater portion of it. Oil-cake, however, still continues to maintain its ground among cattle-feeders, notwithstanding the extent to which it is adulterated by the admixture of foreign substances—a fact which speaks volumes in its favour as an article of food. It is, of course, impossible to state to what extent its value is depreciated by such admixtures; but the loss, in a national point of view, from this source alone, must be very considerable, when so much as from fifty to one hundred tons of oil-cake are annually consumed, in some cases, by individual farmers.*

It does not appear that we are in possession of any correct proximate analysis of the seed of the Flax-plant, which is evidently of more importance in the estimation of its feeding properties than an ultimate analysis, of which latter several have been published. In the somewhat imperfect proximate analysis quoted by Professor Johnston in his Lectures, the principal ingredients are stated to be as under—in 100 parts:—

Oil	11.3
Husk, &c.	44.4
Sugar	10.8
Gum	7.1
Soluble albumen (casein)?	15.1
Woody fibre, starch, wax, and resin, &c.	11.3

This analysis, continues the learned Professor, shows that the seed of Flax contains considerable proportions of gum and sugar, and a large quantity of a substance here called soluble albumen, of which nitrogen is a constituent part, but which differs in its properties from the gluten and albumen of the seeds of Corn-bearing plants, and has much resemblance to the curd of milk. Besides their fattening properties, therefore, which Flax and other oil-producing seeds owe in a great measure to the oil they contain—this peculiar albuminous matter ought to render them very nourishing also; capable of promoting the growth of the growing, and of sustaining the strength of the matured animal.†

It is certain that the loss sustained by the expression of the oil in Flax-seed, as food for the domestic animals, is much greater than the money value of the oil itself; and that, therefore, besides guarding against imposition, in the form of adulteration, it would be more economical, on the part of the feeder, to use the Flax-seed itself, in preference to the oil-cake. Nor is the management to be adopted in the latter case difficult to be carried into effect. The seed is merely reduced to meal and boiled, when a jelly is formed, abounding in mucilage and other nutritious matters, which may be used in combination with almost every other kind of food. For every pound of meal, two gallons of water may be employed, to which may be added, after the mixture has boiled a few minutes, a proportion of bruised Oats, Barley, refuse Wheat, or other similar matters, with a quantity of cut Hay or Straw, sufficient to impart a degree of consistence. After simmering over a slow fire for a few minutes, this will absorb the mucilage, and the mixture will be ready for the animals when cold enough for use. A little experience will show in what proportions the various ingredients which may be used can be most economically employed. Potatoes, or other roots, cut Hay or Straw, Clover—in fact almost every article of farm produce—may be used in conjunction with this mucilage, as food for every one of the domestic animals.

But it is not necessary to dwell at great length on this part of the subject, as no difficulty will be experienced in the preparation of the food. I shall, therefore, proceed to describe the management at Horkesley Hall, alluded to in my last paper on the subject, which I am enabled to do through the obliging attention of the Rev. Mr. Blair Warren, whose course of management in reality seems to be well worthy of imitation. The system which he carries so well into operation is, however, that of Mr. Warnes, of Norfolk, whose exertions in this department of farm management have been noticed in my last paper on this subject.

The preparation of the compound may take place in a common boiler, but where a considerable number of animals are to be fed, the process will be much more economically and conveniently performed by steam; and the expense of the erection of an apparatus for this purpose will soon be repaid by the saving of labour and fuel thereby effected. By means of pipes steam is conveyed from the boiler in which it is generated to one or more vessels placed convenient to it; and the water in these vessels may be boiled altogether through the instrumentality of the steam thus introduced; or a portion of it may be drawn off from the boiler itself, by means of a stop-cock—in which latter case the preparation of the food will be materially hastened. While the water in these vessels is kept boiling in this manner by the steam conveyed to them, the required quantity of Flax and meal is to be gradually added, the mixture during the time being stirred about. Flax-seed, in its whole state, is well known to require lengthened boiling before it can sufficiently impart its mucilaginous properties to the mixture; but when ground into meal it does so rapidly; in fact it is only in this state that its nutritious properties can be properly developed. After the Flax-seed has been added, and the whole boiled a few minutes, the farinaceous matters to be afterwards added should be in readiness, observing that the grain or pulse employed should be bruised, and the Hay or Straw cut into chaff. The quantity and proportions of each of these matters will, as has been already observed, depend on the peculiar circumstances of the farm, and the intention of the feeder. The refuse grain, which could not in other cases be perhaps profitably appropriated, is here economically applied. But the presence of other farinaceous matters, though desirable, is not absolutely essential in using Flax-seed jelly. It may be advantageously employed in conjunction merely with cut Hay or Straw, or any description of green feeding, as Clover and Grass, Vetches, Lucerne, &c., after being cut by the machine, to prevent waste.

The system of feeding on compound of Flax-seed, &c., may be carried on in conjunction with pasturage or any other plan of house-feeding. During the summer months, when the cattle and sheep are on their pastures, they may be supplied with a portion of the Flax-seed mixture once or twice a day; and one of the beneficial effects of such a course of feeding will be, to make the animals relish and eagerly consume the most inferior description of herbage, on which they would otherwise starve. The supply of Grass may also by these means be greatly economised, especially in the case of sheep feeding, as they may be confined by hurdles to a given extent of the Grass until they have eaten it down, and this will not only economise the Grass, by causing it to be all eaten as gone over, but will also contribute materially to enrich the land, by the folding of the sheep. In this manner, in fact, a plot of ground is gone over regularly by piecemeal, with as much uniformity as if undergoing the operation of the scythe. In certain situations sheep or cattle cannot be fattened during the summer months advantageously, owing to the innutritious quality of the herbage; but it will be apparent that in combination with the mixture described, the most inferior natural herbage may be successfully employed for fattening. But the ultimate effects of this course of management in such situations, as regards the improvement of the soil itself, are even more important than the immediate one of being able to put on flesh. It is evident that if persevered in for a time, whether the Flax-seed employed be of home or foreign growth, the fertility of the soil will eventually be permanently increased, by the production and application of the increased quantity of valuable manure which is thereby occasioned. Compared with such a system of manuring, the application of guano or any of the numerous fertilisers to which attention is now directed, is comparatively unimportant. It is an important fact to bear in mind that no manure can ever successfully enter into competition with that of the farm-yard, when of home production. Being a bulky article, however, its value is seriously diminished when it is to be conveyed any considerable distance; and hence the advantage possessed by the portable manures in this respect.—*J. Sproule.*

ON THE APPLICATION OF SCIENCE TO PRACTICE IN AGRICULTURE.

LAST year I made an effort to stimulate the farmers of Suffolk to adopt a system of experimenting on a cheap and easy scale, for the purpose of securing a multiplicity of facts by which men of science might be able to test their theories, and elicit the principles upon which a correct practice of Agriculture depends. More than a twelvemonth's additional experience has added to my convictions that very few farmers possess any just notion of what is meant by the application of real science to practice. I perceive, indeed, that the subject is commanding increased attention, and that numerous attempts have been made and are making with various success in the right direction; but still I think the application of science to practice ought to be advancing at a much more rapid rate than it is. I have already directed attention to some remarks of Sir John Herschel, in his popular "Discourse on Natural Philosophy," and I shall here extract another passage which places the difficulties in the way of applying science to practice, in a just point of view. I quote it as preliminary to a few remarks I wish to make upon some observations of practical men (which I have lately noticed), with reference to certain attempts which they consider to be failures, in the application of scientific principles to the improvement of Agriculture. "Art is the application of knowledge to a practical end. If the knowledge be merely accumulated experience, the art is empirical; but if it be experience reasoned upon and brought under general principles, it assumes a higher character, and becomes a scientific art." "Applications come late; the arts continue slowly progressive, but their realm remains separated from that of science by a wide gulf, which can only be passed by a powerful spring. The whole tendency of empirical art is to bury itself in technicalities, and to place its pride in particular short cuts and mysteries, known only to adepts; to surprise and astonish by results, but to conceal processes. The character of science is the direct contrary; it delights to lay itself open to inquiry, and is not satisfied with its conclusions, till it can make the road to them broad and beaten; and in its applications it preserves the same character, its whole aim being to strip away all technical mystery, to illuminate every dark recess, and to gain free access to all processes, with a view to improve them on rational principles. It would seem that a union of two qualities almost opposite to each other—

a going forth of the thoughts in two directions, and a sudden transfer of ideas from a remote station in one, to an equally distant one in the other—is required to start the first idea of applying science."

I lately stated in the *Gardeners' Chronicle* my admiration of the bold attempt which Mr. Mechi has made to carry out the views of modern speculators in the improvement of Agriculture. I saw a notice this last week in one of our local papers that a practical gentleman has pronounced his attempt to be a complete failure, and he also states it is so considered to be by the whole of the neighbourhood. Possibly these strictures may be somewhat premature; but still, if Mr. Mechi should prove an Agricultural Curtius, and by his vigorous hazard succeed in assisting to close the gulf which at present yawns between science and practice, his fearless devotion must command the respect of all who are not so apathetic to admire the zeal he has manifested for the interests of Agriculture. Very possibly some parts of his scheme have been injudiciously laid, and may be improved upon; and perhaps some of his calculations may have been grounded on insufficient premises. It is very possible, also, that whilst Mr. Mechi possesses a laudable faith in the abstract truths promulgated by scientific men, yet he may have fallen into a common error of practical men, in supposing that science is already sufficiently advanced to dictate to practice whatever may be executed on a grand scale. Now practical men must still be assured that the leap to which Sir John Herschel alludes has not yet been taken. Science is at present only training the athletic for the leap he must take if Agriculture is to become a scientific art; but she is not exactly requiring him to part with all his flesh and muscle, and so contrive to lose the stakes for want of strength sufficient to spur an unwilling horse. The method which science for the present proclaims to be most advisable for securing the advance of Agriculture, is that which I have so pertinaciously pointed out in the several writings of some of her best mouth-pieces, viz., "experimental co-operation upon an extended scale." My schedules A are now coming in, and I already see with increasing conviction the importance of this plan. A gentleman devoted to Agricultural Chemistry was here at the beginning of this week, and he remarked to me that he had himself found how impossible it was to trust to the results of any one, two, or a dozen such experiments as those which must be tried. He admitted it is necessary they should be attempted by hundreds and by thousands. A correspondent in the *Agricultural Gazette* a week or two ago, sneers a little at "March of Intellect Men," and complains that some of their schemes have so far misled him as to have marched the profits off his farm. I suspect we must class your correspondent among those "Halt of Intellect Men" who so frequently verify the old proverb of "the more haste the worse speed." They fancy that some well-established principle in science will lead immediately to great practical results; and then they proceed to apply it according to their own conceits, in a way which insures to them abundance of disappointment. When they thus fail in their calculations, they fall in dudgeon with science, and sit down abruptly in "the seat of the scorner," and declare they will have nothing more to do with "new-fangled schemes." *Ex. gr.* The value of liquid manure is now pretty generally acknowledged by gardeners at least, if not by farmers. It was asserted, many years ago, that its value was duly appreciated in the more advanced agriculture of some foreign nations; and some of our English farmers, with their usual enterprise, bought manure carts and dug tanks, and then failed in applying this manure beneficially. The tanks were filled up, and the carts allowed to rot. But it was mismanagement in the application which led to these failures. Science was right—foreign farmers were right—English inexperience was at fault. Within the last week I have heard of a farmer who built a large tank, about two years ago, and carefully filled it with liquid manure. He found it produce no beneficial result. My informant ascertained that he had delayed the application too long. He had suffered it to putrefy; and had not attempted to prevent the escape of the carbonate of ammonia; and had only applied it after it had become comparatively worthless. If farmers wish to see science successfully applied to practice, they must either obtain for themselves a sufficient knowledge of chemistry, botany, entomology, geology, &c., to enable them to perform the requisite experiments, or they must trust to the guidance of those who are acquainted with these sciences, as to the sort of experiments it is necessary they should undertake. A time will come when the leap shall have been taken, but, in the mean time, we can only say "God speed the Plough," as heretofore.—*J. S. Henslow, Hitcham.*

ON THE APPLICATION OF MANURES.

Admitting the accuracy of the principles I have advanced in these papers, the proper mode of applying manures is easily ascertained. I allude to manures—popularly so called. As the root has hitherto been considered the only inlet of nourishment to plants, the leaves have been treated of only as digestive organs, the ground has been considered the only storehouse, and we have closed our eyes to the evident indications of nature in the volatility of decomposing animal and vegetable matters. In a vain attempt to force these matters on the roots of plants, we have buried them at depths which we thought would prevent the escape of their effluvia. Now as their volatile parts are taken in by the leaves, in lieu of burying we should lay them on or so near the surface as to be accessible to our surface operations, which let loose the effluvia, while the plants are growing; and as a plant from its earliest growth, from the first shooting of its plumule, takes in these effluvia, and as on a strong and vigorous early growth the future strength of the plant will much depend, a portion at least of these matters, in an advanced stage of decomposition, should be placed at or as near the seed as possible; guano may be usefully and, from its portability, handily employed. Whether we think proper to top-dress a growing crop or not, frequent surface hoeings are requisite to keep up a continuous discharge of these effluvia from the soil. There can be no doubt that repeated, continuous hoeing, by giving to the plant its food, must promote its more rapid development; but in order to continue these operations to a late period of its growth—for at a late period they are most valuable—we must make our rows at considerable distances, in grain crops at much greater indeed than we have been accustomed to do: from eighteen inches to two feet I think would give us distance enough; and from experiments stated hereafter, this will give a greater return of grain and straw than any other distances. At such a distance I feel assured a greater number of stems would be found in a given space of ground than would be in a broad-cast or narrower drilled crop, and these would carry a better head, have a more standing crop, be reaped with greater facility, and, from the absence of weeds, be carried much sooner. But the advantages of a wide row system are not confined to the growing crop—they extend to future and far distant ones. Apart from the cleanliness produced, the constant fallowing process so opens the soil, as to induce the solution by the atmosphere of those inorganic bases which are required by plants, and the want of which makes the alternation of crops necessary; the soil may thus, by this thorough cultivation, be made to bear the same crop successively, or at shorter intervals; or, which amounts to the same thing, to yield a heavier return in the course. The dews and light rains, instead of evaporating, enter the soil to assist the chemical changes, provoked by the moving of its parts; light pervading all the spaces between the plants, in these wide rows, enables the leaves to appropriate and decompose the carbonic acid of the air. In the country from which I write, the general adoption of the wide-row system would be necessarily attended with peculiar public good. Here there is a want of capital, which alone frequently places a difficulty in the way of the small farmer, in seeding his ground, and often delays him till the proper season is past; and from this a want of employment follows. Here in the wide-row system a remedy, to a considerable extent, is at hand. The value of the excess of seed, which is everywhere shed over the ground, would pay for an amount of manual labour that would leave none but the will-be-idle unemployed throughout the growing season of the year. From three-fourths to two-thirds of the seed would be saved, and this alone is a national object.—*J. M. Goodiff, Granard.* —— P.S.—About twenty-four years ago a small plot of ground was sown with Barley—it was divided into five equal parts; on the first, the seed was thrown broadcast by the hand; on the second, it was sown in rows 7½ inches asunder; in the third, 15 inches asunder; in the fourth, 22½ inches asunder; and in the fifth, 30 inches asunder. The produce both in grain and straw (separately), was carefully weighed as soon as possible after being cut. No. 1 gave the least return in both Corn and Straw; Nos. 3 and 5 gave an equal return, but more than 1 and 2; and No. 4 gave the greatest return of both. The distance between the rows in this case from which the greatest return was derivable was between 15 and 30 inches. The following year a strip of Lammas Wheat was sown, chiefly with a view of ascertaining how late Wheat might be sown in wide rows; on the 25th March in rows 22½ inches asunder, in a field where the same description of Wheat was sown the November previous in drills 9 inches asunder, the strip of wide rowed Wheat was reaped before the rest of the field was carried, say within ten days after the rest was reaped (it is the custom in Ireland to leave the Wheat in field-stacks some short time, generally till the whole is cut and fit to be carried). When the wide-rowed strip was in stook, I drew at random five straws from it; I did the same from the stacks of five or six Wheat-fields in the neighbourhood, and with private marks to the samples I showed them to several farmers; they all were of opinion that the wide-rowed sample was the best. I have this year nearly half a statute acre of Chevalier Barley sown in rows 18 inches asunder, with the exception of one patch 15 yards by 6 yards, sown at 9 inches; this has not been hoed but hand-weeded; the rest has been hoed three or four times; the patch was at once distinguished some time before harvest by the lightness of its green. The wide drills were sown at the rate of six stones to the statute acre in the middle of May (could I have sown it in April I would not have given more than three or four stones to the acre); in the patch a double quantity of seed was sown—that is at the rate of 12 stones to the statute acre; yet I do not think there are more stems in it, and I would challenge any broadcast field to produce more of good Corn. Notwithstanding the late rains it is a standing crop. When the crop is cut I will forward a statement of its produce. [Thank you.]

SKETCHES OF EAST LOTHIAN HUSBANDRY.

Harvesting.—East Lothian being somewhat celebrated as a Corn-growing county, a brief description of its mode of harvesting, or manner of cutting and securing grain-crops, may prove acceptable at this season, before noticing the cultivation of individual crops.

There is some diversity of opinion amongst agriculturists respecting the degree of ripeness necessary befor cutting down Corn, but the practice of the best farmers in this county appears to sanction the performance of this operation before the grain and straw become dead or thoroughly ripe; grain-crops, particularly Wheat, are therefore generally cut before attaining perfect maturity. The common criterion of sufficient ripeness, as indicated by the straw, is when it begins to shrink and become white about an inch below the ear. The circulation of sap to the grain is then cut off, and all further benefit arising to the crop from remaining longer uncut is consequently terminated.

Although the scythe is now, and has been for many years, much employed by some farmers, reaping, or shearing, as we here term it, with the sickle, is by far the most general mode of cutting down the Corn-crop. There are two kinds of sickles made use of—the serrated and the smooth-edged or scythe-hook; the latter is generally preferred, as being more expeditious and less difficult to work with than the former; but as the farmers now find it extremely troublesome to prevent the reapers, when the scythe or smooth-edged sickle is used, from cutting down the crop in a peculiar manner, termed slashing, which is at the best but a very imperfect and objectionable process, strictly prohibited by good farmers, the serrated instrument is again coming into general use. Low reaping is particularly insisted on, and, generally speaking, everywhere practised. Some farmers are in the habit of giving a small additional allowance, as an encouragement or reward to such reapers as have, during the course of the harvest, executed the lowest and cleanest work. The ridges being usually 18 feet in breadth, three reapers are placed upon each of them; one man, denominated a bandster, binds and stooks the sheaves to six reapers.

In ordinary cases, the stooks, or shocks as they are in some places termed, are made in every alternate ridge; but when the crop is light, two neighbouring bandsters often stook together. In the case of Wheat, six pairs of sheaves make a stook; but when the crop is Oats or Barley, the stook may consist of only two, three, or four pairs of sheaves, according to the state of the weather and the inclination of the farmer. In many places two hooding sheaves are placed on the top of each stook to protect the grain from the effects of inclement weather; but they are here entirely omitted, of whatever kind the crop or season may be. As binding and stooking are operations of the greatest importance, to which too much attention cannot be devoted, none but the most careful and expert are employed in that department. The stooks are invariably set in a direction from north to south, that the sheaves may be equally dried on both sides.

Small-sized sheaves are always preferred, but especially when the crop has been cut rather prematurely, or in a damp state. In general cases, the binding and stooking are carried on simultaneously, but it frequently becomes necessary in this county to cut part of the crop in a wet condition; and in this case, instead of the usual method of binding, the sheaves are loosely tied near the corn-ends. Each sheaf stands singly on its own basis, the bottom being drawn out in a circular manner to maintain it erect. This operation is termed *gaiting*. It is applicable only in the case of Oats and Barley, and being attended with a considerable deal of after-trouble, is never resorted to except when the Corn is cut while in a damp state. When ready for stacking, the gaits are all firmly bound in the usual manner, and either conveyed immediately to the stackyard, or stooked in the field until it becomes convenient to remove them.

Reaping with the sickle is decidedly the most general mode of cutting down grain crops in this county; but the scythe, as already observed, has been long though partially employed for the same purpose, and is, on the whole, gaining ground, as with it the straw is cut much closer to the ground, and the whole operation performed more cheaply and expeditiously than can be done with the sickle. The principal objections here urged against mowing grain-crops are—that the Corn is not laid down with the same regularity, nor the ears made to lie in one direction, so uniformly as when the sickle is used; that the grain is more liable to vegetate and sprout while in the stook, in moist weather; that the stack of mown sheaves has a rougher appearance; and exposes more grain to the weather and the depredations of birds; and that mown sheaves are more difficult to be threshed, either by the flail or threshing-machine. It is contended, on the other hand, by the advocates of scythe-cutting, that the irregularity and imperfection imputed to mowing arise chiefly from the want of skill, dexterity, and care on the part of the mower and his attendants; that a man can bind and stook one-fourth more sheaves in a given time, when mown, than he can when reaped; that mown sheaves dry quicker, and are ready for stacking several days sooner than reaped ones; and, above all, that the scythe possesses a great superiority over the sickle in point of economy and despatch. In Aberdeenshire, and some others of the northern counties of Scotland, the whole of the grain-crop is mown without exception, and the labourers there have acquired, from continued practice, much dexterity in the use of the scythe. A considerable quantity of Oats was last year mown by Aberdeen men, in this county, and the farmers appear anxious to introduce and extend the practice. The usual custom is for the farmer to contract with one man for performing the mowing, lifting, binding, stooking, and raking per acre. This man, who engages to have all these operations executed to his employer's satisfaction, hires a sufficient number of persons—men and women—from his own country to cut all the Corn he can obtain. A contractor, or undertaker of this kind,

has generally several sets of mowers and their attendants working at the same time, on contiguous farms. Numerous contracts have been made for the present harvest, not only in this, but in several other counties in the south of Scotland.

The scythe employed by the Aberdeenshire mowers, and which is expected soon to become general throughout this county, differs considerably from the common one in the shape and length of the handles. It has two short handles, one projecting from the other, which, by placing the operator in a less constrained position, render it more easily worked than the common one. This scythe has no cradle or other appendage; each mower is attended by a woman, to make bands and place the Corn in sheaves upon them, and a man immediately follows to bind and stook the sheaves. A stout boy provided with a large corn-rake having curved iron teeth, can rake to three scythes.

Reaping by the sickle is also sometimes, but not frequently, performed by contract. The county is abundantly supplied with reapers from Ireland and the Highlands; they are hired by the week, and paid according to a certain rate of wages agreed upon by the farmers at weekly meetings held at Linton and other places. The average rate of wages for reapers during the last few years has been about 9*s.* a week, not including their diet, which is commonly reckoned at 8*d.* per diem. In the generality of farms, four men are considered to be capable of cutting and stooking an acre of Corn on an average daily throughout the harvest; these, at 1*s.* 6*d.* each per day for wages, and allowing 8*d.* for diet, make the expense of reaping with the sickle 8*s.* 8*d.* per acre. The cost of cutting with the scythe is considerably less: a good mower will cut down 1½ acre of Wheat, or 2 acres of Oats or Barley, of an average quality and not much laid, in 10 hours. Taking the Oat-crop for an example, the cost of mowing, binding, stooking, &c., 2 acres, will be as follows:—

	2*s.* 0*d.*
1 man (mower)	
1 man or woman (gatherer)	1 6
1 do. (binder)	1 6
1 man can rake to three scythes	0 6
Wages	5 6
Diet	2 6
Cost of cutting 2 acres	8 0
Do. of 1 acre	4 0

—*T. Sullivan.*

(To be continued.)

Home Correspondence.

Drainage.—In looking over the strictures of "A Farmer and Valuer," on my remarks on the Report of the Debenham Farmer's Club, the first thing that strikes me as extraordinary, is that an individual, who it would appear is unwilling to give even the authority of his own name to his statements, should expect that his *ipse dixit* would affect the observations which I made, backed as they were by what I conceive sound reasons and the experience of the best practical drainers in this or, I will venture to say, any other county. As I conceive it to be the duty of every individual to contribute his mite to the overthrow of error, and as I think the cultivation and use of "plashings," as practised at Debenham, a most grievous agricultural error, I shall make no other apology for criticising the remarks of your Stowmarket correspondent. He complains of tile drains becoming choked with clay, but it must be evident to every one acquainted with the subject, that that is the fault of the execution of the drains, not of the tiles, as no well executed tile drain can have "clay worked into" it; indeed, from the very nature of clay, there is no kind of soil in which drains are likely to last so long, and there are many tile drains in this county, but especially in East Lothian, in all varieties of soil, from plastic clay to sandy loam, which have been in use for twenty years, which are found to work as well as they did when newly put in. I would recommend to "A Farmer and Valuer," the next time he is induced to try tile-draining, whether by "chance or otherwise," to put the tiles out of the reach of any working whatever. One of the reasons given by your Stowmarket correspondent in favour of his much-loved "plashings" really deserves the epithet—ludicrous; it is, "that it," that is draining with straw and plashings, "has been in use in their county for nearly a century, and found very beneficial." I have no doubt his ancestors in the days of yore found it very beneficial to live in a cave or a hut, but that is no argument against the use of a modern house. Does your correspondent carry out his principle by grinding his Wheat in a quern, in preference to what I presume he will term "march of intellect" nonsense—a flour-mill? Is his plough a crooked tree? Does he prefer the ancient wild breeds of cattle and sheep to the short-horn and new Leicester? All these had the merits of ancient usage, and of being beneficial in their days; that day has gone by. I have no patience with men who rail at what they are pleased to term the "march of intellect;" they ought to know that it is to this that their country owes the status which she holds; that it is by this that we are enabled to maintain a population our fathers never even dreamed of; that it is to this, under Providence, that they are indebted for a large proportion of their comforts and enjoyments. Your correspondent says "that he does not pretend to know how the water gets into the drains, except that it will run down hill." What an extraordinary operation the draining of a perfectly level field must be to him. I consider the quotation from Mr. Smith's work on the advantages of draining parallel to the declivity, quite unanswerable, and every one acquainted with the literature of agriculture knows that he, as well as the other writers whose opinions I quoted, are practical men; the words about "written theories" were altogether misplaced. I am not at all surprised that a field drained in any way with "plashings" should not be dry; and with regard to the portion drained obliquely, I think your correspondent's statements very ingenious; but if I had found the water running down the furrows till it fell into the drains, I would have been inclined to call it all equally wet, instead of dry. It would appear that he has some indistinct notion of another way by which water gets into drains besides running down hill, notwithstanding his assertion to the contrary, for he says "that unless the drains are made not further than six or seven yards apart, the water will not *draw* into them." I happen not to have the Number of the Royal Agricultural Society's Journal by me, referred to by your correspondent. Does he mean to assert that Mr. Pusey advocates the cultivation and use of "plashings?" In conclusion, I have just to say what I asserted before that tile-draining was nearly as cheap as that with straw, and I now assert, in consequence of information regarding some of the new tile machines, that in a country where clay can be got, tile-draining is cheaper; and I would give "A Farmer and Valuer" an advice I often see in the *Gardeners' Chronicle*, that no one should write about things they do not know about, far less about what they do not even pretend to know about.—*J. Girdwood, Featherhall, Midlothian.*

Allotments.—Since addressing you on the allotment system, I have read with pleasure a letter published in a provincial journal, from Sir R. Bunbury, calling upon the landowners in West Suffolk to form a society for the alleviation of the distress of the working classes. I am rejoiced to find that one of the modes proposed to effect this object is the allotment system, under the direction of a committee of management, whose duty it will be to provide land for the labourer at a fair farming rent, and not at the exorbitant price generally demanded for small patches of ground. Should the praiseworthy example of West Suffolk be followed by other localities, it will be the means of extricating the poor man from the rapacity of his neighbour, having land to let out, but too idle to work it himself. I have often looked with pity on the labourer, who, after having hardly earned his daily bread by the sweat of his brow, has repaired to his allotment to expend his remaining strength in the vain hope of raising a few Potatoes for winter consumption; when I knew that his utmost exertions would barely enable him to pay the rent, leaving nothing either for himself, or to purchase manure for the following spring, or buy a pig to assist the muck-heap. The allotment system, to answer a benevolent end, must be based on equity, giving the small tenant every facility for turning his lot to the best account, instructing him how to procure the cheapest manures, and how to use them to the best advantage. As you have, in your notices to correspondents, expressed a determination to bring the allotment system fully before the public, I think I cannot leave it in better hands, and will, therefore, not trouble you again on this subject, unless anything unusual calls for remark.—*Falcon.* [We shall always be glad to assist our correspondent, and others interested in the allotment system, in keeping alive a discussion on this subject by the detail of facts and arguments not hitherto published. It is a subject which should be kept constantly before the public.]

Failure of Crops.—We are all in despair in this neighbourhood; the most flourishing of the early sown Turnip crops are daily disappearing. We hope in the next *Agricultural Gazette* for advice on this serious calamity, ■■ it is a most unusual cause of destruction which I am about to describe; and we trust you will suggest remedies, either to arrest the ravages of the insects, or prevent the evil from spreading so rapidly, should it appear next season. About a week since the weather was cloudy, cold, and windy, and suddenly the ground was partially covered with innumerable minute frogs and toads, and the Turnips appeared to have received a check in their growth. At this period my crop was very flourishing; in a day or two the finest plants withered in patches, and now the evil seems almost hourly to increase. The complaint, I grieve to say, is very general, and as no remedy seems to be known, what would you advise being now sown to replace this valuable crop? I send you specimens of the different insects, in the several stages of existence; pray name them, and describe their habits—how they may be destroyed, and in which state they commit the greatest devastation. We observe the Swede suffers less than the Turnip; and where Charlock abounds it is first attacked. —*A Cotswold Farmer.* [We do not know how to help you. Cabbages (the early York), Rye, and Vetches are, as you probably know already, among the earliest of our spring crops. How would it answer your purpose to purchase young Savoy plants of the market-gardeners, and prick them out in your Turnip-beds? They would be ready about Christmas. Your insects have been sent to *Ruricola.* The subject of this communication is a most important one, and any practical farmer who has any suggestion to make, would benefit his "neighbours" by communicating it through us.]

Farm Implements.—After your remarks on the Improvement of Agricultural Mechanics, I wish you could inspect the simple implements which enable 22 persons to gain their living in comfort on 13 acres in my neighbourhood, and two of these families, who had been in the Union-houses of Hallingly and East Bourn, to become rate-payers instead of rate-receivers. They have not a plough amongst them; the 3-pronged fork, 14 inches deep, which the late Dr. Yelloly recommended to the Statistical Society at Liverpool, is better to stir the ground than any plough; and the seed is put in admirably straight lines by a hoe—the Vernon hoe—the seed being deposited by children; and where there are hands enough to do this work, can the most perfect machine moved by a horse be so advantageous, either for the individual occupier or the community, as manual labour? For, by the law of the land, all human beings in England who cannot support themselves must be supported out of rates levied on the land, before one farthing can reach the owner as rent. Witness Cholesbury, as quoted in your Paper some time since. Why not, then, lessen these rates by letting willing hands do all the work that is within their power? for horses need not be kept—men must. Large farms have been the fashion of late years. Will large farms, with fine agricultural machines, drawn by fine horses, yield most rent, or send most produce to market? On the contrary, my little tenants, without a plough, harrow, or any animal of draught, have for a series of years paid me more rent than my greatest tenants. In 1840 I took in hand 1000 acres from a tenant, who also had a better farm in occupation in another parish, to learn why my rent was so low and the poor-rates so high; and I think an investigation into the result would be worth your pains. Not long ago, J. Harrod, of Pevensey, who was in the Hallingly Union in 1840, told the Earl of Devon, who came from London on purpose to see him and other allotment tenants, that he was supporting his family and wife and four children in comfort on three acres, and hoped soon to have nothing but salt to buy for them; and since then, he has reaped his Corn, and says he is satisfied any man can get his living on three acres. My having employed more manual labour on this 1000 acres than my tenant did, and let about 26 acres for spade husbandry, has lowered the rates from 5*s.* 3*d.* to 2*s.* 6*d.* in the pound; and, by the same means, the rates have been similarly lowered in other parishes. By the general adoption of my system, the incendiary fires which raged in Sussex in 1830 would cease, and the Income-tax be rendered unnecessary, and 5,000,000*l.* out of 7,000,000*l.* of the rates in England and Wales would be saved by the produce of a greater quantity of human food raised by the prong than by the plough.—*M. A. G.*

Egyptian Wheat (*Triticum compositum*).—I send you the inclosed sample of a small patch of Egyptian Wheat, obtained by dividing and transplanting from 9 grains, so very diminutive and poor, that for a time I thought it useless to put them into the ground. I have beaten out the grain from five ears, and I find in the smallest 70 grains, and in the largest of them 176 grains. I am not a judge of the quality of the grain, but I think it has been somewhat injured by being cut a day or two too early. The straw is about 5 feet in length; the piece I send is cut from the second joint from the root.—*Henry Moule.* [The ear sent is a very fine specimen of the variety.]

Analysis of Onion.—In answer to Mr. Jackson's query as to the mineral ingredients of the Onion, allow me to state that Fourcroy and Vauquelin found in it sulphur, citrate of lime, and phosphate of lime. There is also reason to believe that it contains much muriate of potash.—*G. W. Johnson.*

Preparation of Seed.—I have, this year, a field of Oats, the centre part of which was drill-sown with seed that had been steeped for 24 hours in the contents of a cess-pool (in which the water from the cow-byer, stable, &c. collects), and subsequently sprinkled in the usual way with lime: on one side of this centre portion the corn was sown by the hand, and on the other drilled, the seed being, in both cases unprepared; the result has been that the plants from the prepared seed have not one single blighted, or black head of corn; but on both sides of it, where the seed was unprepared, they abound. The seed was thrashed from the same stack, the land in the same state of culture, and sown the same day.—*F. D. Johnson, Aykleyheads, near Durham.*

Egyptian Barley.—A young friend of mine had six grains of Egyptian Barley given her last spring, which she planted in her little garden about three inches apart. They have tillered greatly, and now the produce amounts to 70 good ears of six-rowed Barley, of about 63 grains each. Call it 60 only, and here are 4200 grains from 6 grains, or 700 for one.—*S.H.*

Potato-crop.—I have read in your Paper the communication of one correspondent who attributes the failure of this crop to the tubers being unripe as one cause, and this I know from experience to be erroneous. About 33 years ago, I lived in a district where a considerable breadth of land was annually planted with early Potatoes for the Manchester market; and about the end of June, when the small Potatoes were not disposable at market, the Potato-growers picked the largest of the small ones out, and threw them on the ground a few days to harden, and to green a little by exposure to sun and air. Finding them after this to answer the purpose of seed well, I adopted the practice, and have ever since saved the seed Potatoes from the earliest and second sorts in this manner, and have not had one failure in the whole time. This year I planted from seed saved this way at various times from the beginning of April till the middle of June, and in all the various plantings, although the shoots of some of the latest had been broken off twice, previous to planting, I have not one in a hundred that has not come.—*J. Jackson.*

Chemical Analysis.—Can you not urge for general adoption what I have suggested here, "that Agricultural Societies should employ a chemist, who, at a certain fixed rate, should analyse soils and manures for

all members of the Society—the member paying one-half of the expense, and the Society the other?"—*A. L. M., Lincoln.* [This is just what we have taken every available opportunity of advocating.]

Produce of Wheat.—At the end of August, 1843, I planted in my garden 32 grains of Wheat, at 6 inches distance, an inch and a half deep; the seed was of the first-rate quality. This seed produced this year 32 plants, having from 10 to 28 stems and ears each; the average number of ears was 16; the average weight of each plant 1¾ ounce. An acre of land would contain, at 6 inches distance, 174,240 plants; the produce 304,940 oz., or nearly 19,600 lbs., 320 bushels, or 40 quarters per acre. The expense of dibbing would be more than saved by the diminished quantity of seed required. I do not mean to state that such a result would be obtained upon a large scale; but I think it is worthy of trial, when we know that the average produce is only 2½ quarters per acre, and that it is possible (?) to grow 40: it will be allowed that there is ample scope for improvement. Try a breadth in your fields an inch and a half deep; put 1 grain, and 1 only, in each hole—plant it at 6 or 8 inches distant—be sure to plant good seed—get as much produce as you can, but go for 40 quarters per acre.—*Stock Exchange, August 22.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

The Council stood adjourned to Wednesday last, the 4th of September, but no meeting was held on that day, in consequence of the absence of members from town. The adjournment accordingly now stands over the autumn recess, until the 6th of November, when the meetings will be resumed.

Gorse.—Lord Kenyon having announced to the Duke of Richmond, as President of the Society, his intention to give a Prize of Twenty Sovereigns, at the ensuing country meeting at Shrewsbury in 1845, for the best Essay on the subject of Gorse as food for cattle, &c., the following schedule of the terms and conditions of that Prize have been received from Philip Pusey, Esq., M.P., Chairman of the Journal Committee:—"Twenty Sovereigns, or a piece of plate of that value, offered by the Rt. Hon. Lord Kenyon, will be given at the Annual Country Meeting of the Royal Agricultural Society, to be held at Shrewsbury in 1845, for the best account of the use of Gorse for the food of cattle, horses, or sheep, founded on actual experience. Competitors will be required to state the following points:—

1. The quality of land on which the Gorse is grown.
2. The age of the plant when cut.
3. The mode and expense of cutting.
4. The mode and expense of preparing for food.
5. The mode of feeding with the Gorse, and the quantity of other food given therewith.

All Essays competing for this Prize to be sent to the Secretary of the Society, No. 12, Hanover-square, London, on or before the 1st of May, 1845."

The Society have received from Mr. Barton a communication on experiments relating to the application of Sulphate of Ammonia to the Growth of Wheat; from Mr. Towers, a further statement of his results from Dibbled Wheat: from M. Hugues, of Paris, a memorial addressed to the President, calling the attention of the Society to his new Drill, and soliciting a practical trial of its merits; from the Hon. Robert H. Clive, M.P., Vice-Chairman of the General Shrewsbury Committee, and Mr. Peele, town-clerk of that borough, communications on the subject of the facilities intended to be afforded in the conveyance of passengers and stock to the Shrewsbury Meeting, and the preparation of the 20 acres of light and 20 acres of heavy land, in the immediate vicinity of the town, for the trial of implements; from the Rev. Dr. Buckland, a copy of the Address delivered by him at the Southampton Meeting to the Mayor and Members of the Artesian Well Committee; from Mr. Hillyard, of Thorpelands, near Northampton, a copy of the new and enlarged edition of his work on Practical Farming and Grazing, dedicated, by special permission, to H.R.H. Prince Albert; from Mr. Morton and Mr. Atkinson, communications on a proposed reduction of the meteorological observations made extensively throughout the country, under the direction of Mr. Morton, with a view to ascertain the practical value of the rules for predicting changes of weather, contained in the Essays competing for the Society's Prize of the Gold Medal; from Mr. Wyon, H.M.'s Chief Medallist, announcing the completion of the medals struck at the Royal Mint for the Exhibitors at the Southampton meeting, to whom they had been awarded; from Mr. Shaw, copies of the "Farmers' Magazine;" from Mr. Youatt, copies of the "Veterinarian;" from the Royal Asiatic Society, the last Part of their printed proceedings containing notes on Indian Agriculture; from the Royal Agricultural Society of Jamaica, a copy of the Essays on the Cultivation of the Sugar-cane, written in competition for the Earl of Elgin's Prize of 100*l.*; from Mr. Munn, a copy of his work descriptive of the Bar-and-frame Hive invented by him; from Mr. Osborn, a copy of the Prizes of the South-East Hants Association for the encouragement of industrious and meritorious Agricultural Labourers; from Mr. Allen, copies of the "American Agriculturist;" from Mr. Lilley, a copy of his Agricultural Tour in Ireland; from Mr. Peter Hulme, of Philadelphia, a most interesting collection of American Agricultural publications, presented to the Society by Mr. Edmund Ruffin, of Virginia; and from Mr. Pulman, of Axminster, the 2d Number of the "Western Agriculturist," containing the continuation of the Rev. W. D. Conybeare's contribution on Agricultural Chemistry.

FARMERS' CLUBS.

Gloucester.—The following paper on The Best and Cheapest Means of Carrying Stock through Winter during Scarcity of Hay and Roots, was read by Mr. Gyde, of Painswick, at the late meeting of this Club.

My object is to draw attention to those substances produced on the farm, which are capable of being substituted for hay and roots as food for cattle, and to point out the quantities which practice, as well as science, would indicate as equivalent to good meadow hay, in feeding properties. In a paper which I formerly read before you, I showed you how the doctrines of Animal Physiology might be applied to the feeding of cattle. It will be necessary to briefly review the leading points then alluded to. The body of an animal may be divided into three distinct classes of matter, namely, the muscular portion, including all those structures containing nitrogen; the fatty portion, which is devoid of nitrogen; and the earthy and saline portion, consisting of saline matter and bone. Until within the last few years physiologists supposed that the food underwent, in the stomach of the animal, some change during the process of digestion; that the stomach, in fact, had the power of making out of the Grass and roots taken as food, those substances of which its body was composed; this power they termed the *vis vitæ*. But the investigations of modern chemists show that no chemical alteration takes place in the constituents of substances during digestion, but that the elements of the animal body are prepared and elaborated in the vegetable. In the vegetable, we find a principle identical in composition with the muscle of the animal, and known as gluten, vegetable albumen, and casein. We have carbon for combustion in the lungs, to keep up animal heat, supplied in the starch, gum, and sugar of the plant; and we have also oil for the purpose of forming fat, with earthy and saline matter for the bone and blood; these substances are all that the animal requires, of which to build up its structure. This being admitted, it only becomes necessary to ascertain the amount of those constituents of the body daily thrown out of the system by the various channels of waste, to enable us to point out, with some truth, the quantities of each substance necessary to replace the daily loss in the animal economy; or, in other words, to say how much gluten and starch of the vegetable will be required to supply the waste of muscular and other constituents of the animal. Practice says that an ox requires 2 per cent. of his live weight in hay per day; if he works, he requires 2½ per cent.: a milch-cow, 3 per cent.; a fatting ox, 5 per cent. at first, 4½ per cent. when half fat, and only 4 per cent. when fat; or 4½ on an average. Sheep grown up, take 3½ per cent. of their weight in hay per day to keep in store condition; and growing animals should never be stinted. Science has ascertained, by the most carefully-conducted experiments, that a full-grown man voids, in his urine alone, about ½ oz. of nitrogen every 24 hours, and that a small quantity passes off in the solid excretions and by the skin. The carbon consumed by the lungs to keep up animal heat, averages about 11 ounces in the 24 hours; and the saline and earthy matter voided is in direct proportion to the amount taken in the food. It appears that the food consumed by an ox, horse, or sheep, is in direct proportion to their weights when compared with man. Hence we find that an ox would require, to replace the daily loss of muscular fibre, from 20 to 24 ounces of dry gluten or vegetable albumen, which would be supplied in

120 lbs. of Turnips	17 lbs. of Clover-hay
115 lbs. of Wheat-straw	12 lbs. of Pea-straw
75 lbs. of Carrots	12 lbs. of Barley
67 lbs. of Potatoes	10 lbs. of Oats.
20 lbs. of Meadow-hay	5 lbs. of Beans

The consumption of carbon by a cow amounts to 70 ounces; and that of a horse to 89 ounces on an average in 24 hours, which is supplied by the starch, gum, and sugar of the food consumed. Fatty matter is required to supply the fat of the animal, and this also exists more or less abundantly in all vegetable food. Earthy phosphates and saline substances are found in the inorganic portion of all vegetables, and these supply the daily waste of bone, &c., of the body. Hence we see that the animal requires a variety of substances, all of which exist in greater or less abundance in its daily food. In one article of diet we find one substance in abundance, and in another other substances. Thus, farinaceous seeds are made up of starch and vegetable albumen or gluten, with much fatty matter and phosphates. In the oily seeds, as Lint-seed, Hemp-seed, &c., the predominating ingredient is oil, and matter called casein, which is capable of supplying muscle. In the Potato, starch is the ingredient in greatest quantity, combined with vegetable albumen. In the Turnip, sugar and gum supply the place of starch; and in the Grasses and Clovers, woody fibre with albumen, a little starch, and much saline and earthy matter. From a knowledge of these facts, with the assistance of the accompanying Tables, which show the quantities of water, woody fibre, starch or gum, gluten, albumen or casein, fatty matter, and saline matter, contained in 100 lbs. of most of the products of the farm (see Table, No. 1), and the amount of these constituents contained in the produce per acre (see Table, No. 2), the judicious feeder will be enabled so to mix those crops which he has at his command, as to render everything available as food. He may keep his stock in condition by supplying with gluten, starch, and saline matter, the natural waste of the body, or he may fatten, by increasing the amount of food, particularly those articles containing much fat; always remembering that a mixture of food is better than adhering to one article of diet, since it rarely occurs that one contains all those substances required by the animal, and without which healthy and vigorous life cannot be sustained for any considerable time.

TABLE I.—Showing the Composition of 100 parts of the more commonly cultivated crops.

—	Water.	Woody Fibre.	Starch, Gum, or Sugar.	Gluten or Albumen.	Fatty Matter.	Saline Matter.
Wheat	16	15	55	10 to 15	2 to 4	2.0
Barley	15	15	60	12?	2.5	2.0
Oats	16	20	50	14.5	5.6	3.5
Rye	12	10	60	14.5	3.0	1.0
Indian Corn	14	15	50	12.0	5 to 9	1.5
Beans	16	10	40	28	2	3.0
Peas	13	8	50	24	2 8	2.8
Potatoes	75	5	12	2.25	0.3	1
Turnips	85	3	10	1. 2	8	1
Carrots	85	3	10	2	.4	1
Meadow Hay	14	30	40	7.1	2 to 5	5 to 10
Clover Hay	14	25	40	9.3	3.0	9
Pea Straw	10 to 15	25	45	12.3	1.5	5
Oat Straw	12	45	35	1.3	.8	6
Wheat Straw	12 to 15	50	30	1.3	.8	5
Barley Straw	do.	50	30	1.3	.8	5
Rye Straw	do.	45	38	1.3	.5	3
Indian Corn Straw	12	25	52	3.0	1.7	4

TABLE II.—Average Produce of Nutritive Matter of different kinds from an acre of the usually cultivated crops.

—	Gross Produce.		Husk or Woody Fibre	Starch, Gum, Sugar.	Gluten.	Fat.	Saline Matter.
	bsh.	lbs.	lbs.	lbs.	lbs.	lbs.	lbs.
Wheat	25	1500	225	825	150 to 220	30 to 60	30
—	30	1800	270	990	180 to 260	36 to 72	36
Barley	35	1800	270	1080	216	45	36

— —	—	4800	2200	1800	64	24	144

TABLE III.—Showing the relative value of different articles of Food, as ascertained by practice; good meadow Hay being taken at 100.

Hay	100	Carrots	250 to 300
Clover Hay	80 to 100	Turnips	500
Green Clover	450 to 500	Cabbage	200 to 300
Wheat Straw	400 to 500	Peas and Beans	30 to 50
Barley Straw	200 to 400	Wheat	50 to 60
Oat Straw	200 to 400	Barley	50 to 60
Pea Straw	100 to 150	Oats	40 to 70
Potatoes	200	Indian Corn	50
Old Potatoes	400	Oil Cake	20 to 40

The above Table represents the average results from a number of experiments made in France and Holland.

TABLE IV.—Showing the amount of different articles of food of equal value as indicated by theory; good meadow Hay, being taken at 100.

Hay	100	Turnips	600
Clover Hay	80	Carrots	350
Vetch Hay	40	Cabbage	300 to 400
Wheat Straw	520	Peas and Beans	20 to 30
Barley Straw	520	Wheat	50
Oat Straw	550	Barley	60
Pea Straw	60	Oats	50
Potatoes	280	Indian Corn	60
Old Potatoes	400	Oil-cake	20

This Table represents the supposed value as food of the different articles, calculated from the amount of muscle-forming principle, they are capable of yielding to the animal.

Reviews.

The Alpaca, its Naturalisation in the British Isles considered as a National Benefit, and as an Object of immediate Utility to the Farmer and Manufacturer. By William Walton. Blackwood & Sons, Edinburgh.

For most of our cultivated plants, and indeed for many of our domestic animals also, we are indebted to other countries. With regard to the former, the history of their introduction is in many cases well established in detail; but it is so long since the latest of them, the Potato, the Turnip, or the Mangold Wurzel, or Carrot, for instance, was first cultivated in our country, that farmers have fairly settled down into the belief that they must make the best of the subjects they have on hand, for that Nature has nothing further in her stores suited, in our climate, for the wants of man or beast. And with regard to the latter, the introduction of the very latest dates so much farther back, that we must estimate the prejudice as stronger still which scouts at the idea of any further addition being made to our stock of domestic animals from the lists of other countries. Of course, in speaking of this universal prejudice, we allude simply to the generality of those who at present occupy and cultivate our soil, and who form their opinion probably without very well knowing the grounds upon which it rests.

There is every probability, notwithstanding the general notion to the contrary, that a useful addition will shortly

be made to our stock of domestic animals. The Alpaca, from the experience of it which has been compiled from various quarters in this country by Mr. Walton, really seems likely hereafter to play an important part in the stock-farming of the hilly districts of the kingdom. This animal is indigenous in the mountainous regions of Peru, where two domesticated species of it occur. The one receiving the name of Llama is used as a beast of burden; the other—the Alpaca—to which we at present allude, is a wool-bearing animal, and of it large flocks were formerly possessed by the Incas, sovereigns in former days of that country, and by other wealthy inhabitants of it. The climate of the districts in which this animal flourishes is described by Mr. Walton as follows:—

"The woolly natives possess a hardiness of constitution, and a peculiarity of structure, admirably well adapted to the nature of their birthplace. There, during half the year, snow and hail fall incessantly, whilst in the higher regions, as before noticed, nearly every night the thermometer falls below the freezing point, and the peaks, consequently, are constantly covered with an accumulation of ice. The wet season succeeds," &c.

On the applicability of the Alpaca to our soil and circumstances we quote the following remarks:—

"The hardy nature and contented disposition of the Alpaca, cause it to adapt itself to almost any soil or situation, provided the heat is not oppressive, and the air pure. The best proof of its hardiness is its power to endure cold, damp, hunger, and thirst, vicissitudes to which it is constantly exposed on its native mountains; while its gentle and docile qualities are evinced in its general habits of affection towards its keeper. No animal in the creation is less affected by the changes of climate and food, nor is there any one to be found more easily domiciliated than this. It fares well while feeding below the snowy mantle which envelopes the summits, and for several months in the year clothes the sides of the Andes. It ascends the rugged and rarely trodden mountain path with perfect safety, sometimes climbing the slippery crag in search of food, and at others instinctively seeking it on the heath, or in rocky dells shattered by the wintry storm; at the same time that, when descending, it habituates itself to the wet and dreary ranges on the lowlands, so long as it is not exposed to the intense rays of the sun.

"Many of our northern hills would try the constitution of any sheep, and yet there the weather is never so inclement or so variable as on the Cordilleras of Peru. With so many advantages, why then shall not the Alpaca have an opportunity of competing with the black-faced sheep, the only breed that can exist in those wild and inhospitable lands? Of the two, the stranger would fare best on scanty and scattered food, at the same time affording to the owner a far better remuneration."

The Alpaca wool is at present used largely in British manufactures. Mr. Walton estimates the quantity hitherto consumed since its introduction in 1832 at 12,000,000 lbs. The price of it varies from 1*s.* 8*d.* to 2*s.* 6*d.* per lb., and the average weight of the fleece may be put at 10 lbs. Were the animal fairly naturalised on some of our bleakest hill districts, such land would soon increase in value from the increased worth of its annual produce in Alpaca wool. And it appears from the experience of several gentlemen who have small flocks, that, when its habits shall be thoroughly understood, little difficulty will be experienced in doing so. The following is a statement by Mr. Stirling, of Craigbarnet Place, Lennoxtown, Glasgow—a gentleman better qualified to speak on the subject than any one we could name:—

"I can have no doubt that, when the subject is better understood, the animal itself better known, and a more expeditious method contrived to bring them to Britain, we shall have thousands of them. When known, their docility, their temperate habits, their hardiness, and, I may add, their easy keep, will erelong bring them into general notice. I can answer, without the fear of being contradicted, that they will thrive and breed in Scotland, equal, if not superior to our native blackfaced sheep."

To those who would laugh at the idea of bringing over here, and domesticating on our hills, a Peruvian camel or sheep—for the Alpaca has properties in common with both—we would point to Australia as a country which not many years ago possessed no quadruped but the kangaroo, and yet, notwithstanding its many peculiarities of climate, is now thickly peopled with our sheep and oxen. But the question must not be left to generalities of this kind—the experience of a few short years on the larger scale, which expected importations will enable, will determine it satisfactorily; and if, as in all probability will be the case, the Alpaca should become one of our domestic animals, the best thanks of the country will be due to Mr. Walton for the persevering energy with which he has pressed the subject on public attention. His book is an exceedingly interesting and neatly got up little volume, and will, we doubt not, prove a useful publication.

Miscellaneous.

Extraordinary Produce.—A correspondent says,—In the course of last week, as I was taking in some Peas for seed, curiosity induced me to count the number produced from several Peas separately; and among others, I give you the following as a sample:—I found one Pea had produced 94 pods, containing altogether 344 Peas; another 99 pods, containing 368 Peas; a third had produced 102 pods, containing 418 Peas; and a fifth had produced 105 pods, containing altogether 432 Peas. The lengths of the haulm, measured from the ground upwards, are as follow—first, 2 ft. 2 in.; second, 2 ft. 10 in.; third, 2 ft. 6 in.; and fourth, 3 ft.—*Gloucester Journal.*

Notices to Correspondents.

Books.—*Tyro.*—There are many good ones. De La Beche's "Manual;" Lyell's "Elements;" Philip's "Guide," and his "Treatise" in Lardner's Cyclopædia; Trimmer's "Practical Geology and Mineralogy." We have been informed that Prof. Johnston recommends the last to his class.

Bone-dust.—*Querist.*—Apply 3 qrs. of ordinary bone-dust, broadcast, per acre, on your pasture land, now. We do not know how to destroy wireworm. Work your land thoroughly; lay it well open to the frost; and in your spring cultivation, use Crosskill's clod-crusher, or some equally efficient presser. Perhaps that may help you. See Mr. Curtis's Paper on the wireworm, in the English Agricultural Society's Journal.

Dibbling Wheat.—*Constant Reader.*—If you intend to adopt this system on the large scale, use Newberry's dibbling machine. The seed you will save by its use on 100 acres will pay for it the first year. But if your object is a merely experimental one, a simple dibble used in some places will answer your purpose; it consists of an inverted T with pendant dibbles about 2 inches long at intervals of 8 inches. This makes, perhaps, six holes at each blow, in each of which two grains should be placed—one to grow and one for the birds, if they choose to have it. If you will forward your address, we will publish the facts you state. To decompose common salt, slake caustic lime with a saturated brine, and leave it spread out for a week. The carbonate of lime which is at first formed, decomposes the muriate of soda. Carbonate of soda and muriate of lime—an extremely deliquescent salt—being the resultant compounds.

Distemper.—*T. D.*—Pleuro-Pneumonia only attacks horned cattle. Your dogs have probably got the distemper.—*W. C. S.*

Drainage.—*T. T.*—Many thanks: your views are, we believe, quite correct, and we shall give them prominence as soon as possible.

Draining.—*D. E. F.*—Many thanks for your offer, which we gladly accept.

Flax Dodder.—*B. B. H.*—You must cut it out of your Clovers, gather it in a heap carefully, and burn it. We shall, probably, publish next week for our agricultural readers, the substance of communications on this subject, in the *Gardeners' Chronicle* last year.

Indices of Well-drained Land.—*Querist.*—Land may be well drained though it dries patchy in spring; this may be owing to a variability in the composition of the soil, or to the former existence of occasional peat deposits in the field from stagnant water; it may be well drained, though after heavy rains you find at the lower ends of the furrows the sands and silt washed down and deposited, evidencing a flow of water over the surface; this will often occur after showers on land which is thoroughly dry, either naturally or artificially; it may be drained sufficiently, though water should stand twelve hours after rain in the footmarks of horses; in ordinary clay soils, the least puddling or breaking of the surface will cause the retention of water on the surface, even at the very edge of a ditch; and land may be sufficiently drained though even twelve months after the completion of the operation, Rushes and Sedges be found in the Grass: their destruction by drainage is a work of years, not of months. But we doubt that it cannot be considered sufficiently drained if a hole 2 ft. deep near drains 30 inches deep retain the water for many days after rain. You must, if this be the case, adopt some measure in dry weather for loosening the subsoil—by subsoil ploughing, for instance. On land such as you describe, 6 yards is a sufficient interval between drains 30 inches deep, to effect its drainage, *i. e.* provided you adopt all possible means of loosening the subsoil after the drains have been some time in action.

Kelp and Guano.—*Subscriber.*—The addition of finely powdered kelp to guano would be advantageous, provided no caustic alkali existed in it. Mix equal quantities. The best mode of using graves for Potatoes or Turnips, though we never before heard of such an application, is, probably, to let it ferment together in a heap covered by fresh mould, and apply, probably 4 or 5 cwt. per acre in the drills.

Mangold Wurzel.—*Subscriber.*—We think that the food for cattle afforded by the under leaves of this plant can rarely be worth sufficient to balance the injury done to the plants by taking them off.

Pipe Drain-tiles.—*J. B.*—The publication of the information you require would subject us to advertisement duty. We cannot recommend tradesmen. Mr. Etheridge said at Durham the other day, that you could make them on your own land for 15*s.* a thousand. You had better apply to him about it.

Preparation for Grass.—*Admirer.*—Do not be afraid of spoiling your Grass by tearing it to pieces. A strong harrow will not be sufficiently efficient—you had better use a scarifier and work it to and fro thoroughly, then sow your seeds, and roll with a heavy roller. Do it in wet weather if possible. Much the best plan is to break up your land if it be foul; but this you say you cannot do. Lawson recommends for dry gravelly situations which resist a sward from all ordinary means, Agrostis vulgaris 6 lbs., Festuca rubra 3 lbs., and Poa pratensis 6 lbs. per acre.

Report of Discussion on Potato Failure.—*W. E.*—Thank you: you will see that you have been anticipated.

Tanks, &c.—*A Subscriber.*—Make them circular, basin-shaped at bottom, and cover them over with a flat dome. A depth of 8 ft. and width of 12 will be a convenient size for a stable of 6 or 8 horses. The liquid should have sulphuric acid or sulphate of iron added to it occasionally; and may be removed by a pump and spread directly on the land, or indirectly by making dung heaps. We know of clay lands on which farmers use Cone Wheat only, and on comparatively light soils Red-straw Lammas is used. From experience on both clay and sand we can recommend the varieties advertised in our columns by Mr. Morton.

*** As usual, many communications have been received too late.

Markets.

SMITHFIELD, Monday, Sept. 2.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3*s*	8	to 4*s*	0	Best Downs & Half-breds	3*s*	10 to 4*s* 0
Best Short Horns	3	6		3 10	Best Long-wools	3	6 3 10
Second quality Beasts	3	0		3 2	Ewes and second quality	3	0 3 4
Calves	3	4		4 0	Lambs	3	8 4 4
Pigs	3	4		4 0			

Beasts, 3811; Sheep and Lambs, 36,040; Calves, 113; Pigs, 360.

We have a large increase in the supply of Beasts to-day, occasioned, in some measure, by several of the freshest Beasts being draughted from the droves intended for Barnet Fair and put into this market; we have not, however, too many of the best qualities on offer; still, the prices are lower; nothing can be said to make more than 4*s* per 8 lbs—indeed, only the choicest realise that sum; a very great many remain unsold; 3*s* 10*d* per 8 lbs is also an extreme price for Short horns. Our supply of Sheep and Lambs is nearly as large, and the trade worse, especially for big Sheep, owing to the hot weather, and the Ewes and middling quality are very unsaleable; only the best quality of moderate size maintain their price; these are still worth about 4*s* per 8 lbs. Veal is lower, and a very heavy trade. Pork-trade is also rather worse, owing to the hot weather.

Friday, Sept. 6.

There is scarcely anything doing in the Beast market to-day, although the supply of fresh ones is not very large; what are sold make fully 2*d* per 8 lbs. less than Monday—Scots, &c., at no more than 3*s* 10*d*, and Short-horns, 3*s* 8*d* per 8 lbs. The very hot weather during the week has spoiled a great deal of meat, and prevented the Butchers killing what they have on hand, consequently there is scarcely any demand to-day for either Beef or Mutton. The best Downs cannot be quoted at more than 3*s* 10*d*, and Longwools 3*s* 8*d* per 8 lbs. Veal trade is rather improved—a nice Calf is worth about 4*s* 2*d*. Pork is very heavy.

Beasts, 652; Sheep and Lambs, 3110; Calves, 203; Pigs, 340.

41, West Smithfield.

HOPS, Friday, Sept. 6.

Our Market remains firm, and the duty from 130,000*l.* to 135,000*l.* A few more pockets of the new crop have arrived, but being so very unripe, we can as yet form no opinion as to what the quality of the growth may be when it arrives at maturity.

Pattenden & Smith, Hop-Factors.

COVENT GARDEN, Sept. 7.—Most articles have been abundantly supplied during the week. The demand for some things has, however, by no means equalled the supply. Pine Apples are good and plentiful, as are also Grapes. The supply of Greengage and Orleans Plums is a little diminished, but other kinds are sufficient for the demand. Peaches and Nectarines of good quality are abundant; Apricots are becoming scarce. A few good samples of Morello Cherries are in the market, but there is little demand for them. Apples of many varieties are plentiful. Among Pears are fine specimens of William's Bon Chretien. The supply of Filberts is increasing. Of Melons, there is sufficient for the demand, and Cucumbers are good and plentiful. Tomatoes are somewhat reduced in price. Among Vegetables, Cauliflowers have not altered in price since our last Report; Broccoli is becoming more abundant, and Cabbages of excellent quality are sufficient for the demand. Carrots and Turnips are good and plentiful. Owing to the favourable weather that we have had, Celery is unusually good in quality; it is quite clean, and free from rot. Endive, Lettuces, and other kinds of Salading are good and plentiful. Cut Flowers chiefly consist of Gladiolus psittacinus, Gardenia radicans, Combretum purpureum, Fuchsias, Pelargoniums, Lobelias, Heaths, Camellias, Verbenas, Roses, Carnations, and Picotees.

FRUITS.

Pine Apple, per lb., 3*s* to 5*s*		Morello Cherries, per hf.-sv., 1*s* 6*d* to 2*s* 6*d*	
Grapes, Hothouse, p. lb., 1*s* to 3*s* 6*d*		Currants, per hf.-sieve, 2*s* 6*d* to 3*s* 6*d*

Chilis, per 100, 9*d* to 1*s* 6*d*		Chervil, per punnet, 2*d* to 3*d*	

MARK-LANE, Monday, Sept. 2.

The accounts from all parts of the Kingdom this morning represent the weather during the past week as having been remarkably fine for the harvest, which is progressing rapidly. This morning the supply of English Wheat was moderate, the quality and condition generally bad, and sales could only be effected at a decline of 2*s.* to 4*s.* per qr. The demand for Foreign was very limited, and we reduce our quotations 1*s.* per qr.—We had a few samples of new Barley at Market, the quality was various, and the value must be noted 36*s.* to 38*s.* per qr.; one very superior parcel from Kent obtained 40*s.* The sale of Foreign was not large, but its late value is supported.—Beans, as also Grey and Maple Peas, are 1*s.* dearer; White are little inquired after.—Oats are in good request, and in some instances a trifling advance is obtained.—We reduce our quotations of the best Mustard 1*s.* per bushel; inferior and damp samples are very unsaleable at a greater decline.

Friday, Sept. 6.

The arrivals of all Corn since Monday have been moderate, and the value of English Wheat continues to have a downward tendency. The attendance at Market being very small, scarcely any business in Foreign has been transacted, and prices must be considered nominally unaltered.—Barley is a limited sale at late prices.—Beans and Peas remain as on Monday.—The Oat-trade is heavy, and barely supports our late rates.

WOOL.—British, Friday, Sept. 6.

Our English Wool Market continues in the same state as last reported. Our advices from Bristol report the Fair as having been heavy; the transactions in Long Wools were limited, but prices fully equal to our late quotations, and holders evinced no disposition to give way.

James Perrin, Wool Broker.

TO GARDENERS, NURSERYMEN, AND OTHERS.

TO BE LET, with immediate possession, within 20 miles of London, a small NURSERY, and PUBLIC-HOUSE doing a good business. The Nursery is well stocked with choicest American Shrubs, Fruit, and other Trees; is situated within a few minutes' walk of a railway station. Every particular can be procured by application to Mr. KERNAN, 4, Great Russell-street, Covent Garden; and Mr. NEAL, Nurseryman, Wandsworth Common. No person without capital need apply.

NURSERY TO BE LET.

TO BE LET, with immediate possession, an Excellent COTTAGE and NURSERY GROUNDS, containing about 3 acres well stocked with a Miscellaneous Collection of Standard and other Rose-trees, Evergreens, &c. The above Stock to be purchased at a fair valuation; it is situated in the vicinity of Croydon, 9 miles from the bridges, and the soil is extremely well adapted to the growth of all kinds of Nursery Stock. Application to be made to Mr. BROWN, Bedford Nursery, Hampstead-road; and to Mr. WELLER, Builder, New-road, Croydon, near the Railway-station.

VERY ELIGIBLE FARM.

TO BE LET on LEASE, from Michaelmas next, Forest Lodge (otherwise Lloscoed), six miles from Brecon, and 15 from Merthyr; containing 700 Acres of Land of the best quality, and in excellent condition. It has a Threshing machine and a Corn and Bone-mill, all worked by water; extensive Barns and Cattle-sheds, a very large Piggery, a Steaming-house, Liquid Manure Tank, and all requisites for the scientific cultivation of the Farm. An excellent Sheep-walk of 700 acres can be attached, if desired. The whole is well situated as to roads.—Apply to Mr. DRAYCOTT, Glanusk, Lenny Bridge, Brecon; or to Mr. LARGE, Bassel Down House, Swindon.

FARMS.

TO BE LET, together or separate, at Michaelmas, next, two advantageous FARMS of 800 acres (more or less) of Grass and Arable Land, with a Sheep Walk of 150 acres. For urther particulars, inquire of Mr. DRUCE, Ensham, Oxfordshire.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangemement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

BURBIDGE AND HEALY'S NEW BOILER and FURNACE for HORTICULTURAL PURPOSES.
Registered under 6 & 7 Vict., Cap. 65.
NO. 130, FLEET STREET, LONDON.

BURBIDGE and HEALY respectfully inform the Horticultural Public that they have constantly on hand an extensive assortment of their new Boiler and Furnace Doors. In very numerous cases where they have been fixed, they have the highest testimonials of their complete success: for the further assurance of those who may require this apparatus, BURBIDGE and HEALY refer them to the Horticultural Society's Gardens, Chiswick; also to Mr. GLENDINNING, Garden Architect, &c. &c., Chiswick Nursery, in the same neighbourhood, where the apparatus may be seen in successful operation, in connection with their new Tanks. The following are the present prices:—

Plain Boiler.		Patent Door and Frames.	Fire-bars & Dead Plate.	Flue Door.	Damper.	Will heat of Pipe.	Forcing Pit, Length by feet.
in.	£ s.	s.	s. d.	s. d.	s. d.		
10	1 5	20	7 6	6 6	2 6	30 feet.	12 to 20
Ribbed Boiler.							
10	2 2	20	10 6	7 6	2 6	50 to 70 ft. 4 in.	Under 25 to 40
12	2 15	30	12 6	7 6	3 6	80 to 125 feet.	40 to 65
14	3 10	35	17 5	8 6	4 6	150 to 250 feet.	65 to 100
18	5 5	42	25 0	8 6	5 6	300 to 400 feet.	Warm a grapery 35ft. long, and a pit 50ft.
24	8 15	50	35 0	8 6	7 6	600 to 800 feet.	

If 3 inch pipe be used, one-third more. If 2-inch pipe, as much more.

The above quantities are rough estimates, which may be varied by enlarging or contracting the fire, or by regulating the fire door. It is possible to heat a much larger quantity of pipe with the boiler, but it would be done at great loss of fuel. The above proportions can be generally relied on as a near approximation to what is correct.

CONICAL BOILERS.—The Boilers invented by JOHN ROGERS, Esq., are made of several sizes, and may be obtained of JOHN SHEWEN, Ironmonger, Sevenoaks, Kent.

They may be seen in operation at Messrs. Chandler's, Vauxhall; Loddiges', Hackney; Henderson's, Pine-apple-place, Edgware road; Rollisson's, Tooting; Pontey's, Plymouth; The Horticultural Society's Gardens, Chiswick; and in the Gardens of the Royal Botanical Society, Regent's Park.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c. by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & C. have also to state that at the request of numerous friends they are now making their Boilers of Iron as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & Co. beg to inform the Trade that at their Manufactory in New Park st., every article required for the construction of Horticultural buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field, and Garden Fences, Wire Work, &c. &c.

GYPSUM, &c.—Pure Gypsum (Sulphate of Lime) for Compost Heaps, Urine Tanks, Stables, &c.; also Sulphuric Acid, Guano (foreign and Potter's), Rape Cake and Rape Dust, and all other Manures, may be had of the Undersigned.

Synopsis of Prices, and mode of use, on application.

MARK FOTHERGILL, 40, Upper Thames-street.

MANURES.—The Readers of the *Gardeners' Chronicle* must have noticed the complaints constantly made there of the Adulterations of Manures, and which are now carried on to a fearful extent.

The Advertiser, a Broker of the City of London, and in daily communication with several scientific Chemists, calls the attention of the Nobility, Agriculturists, and Farmers to his method of supplying Manures, by which a genuine article is secured. Each article is Analysed, and the Analysis forwarded to the purchaser, who can by this means obtain redress should the article differ from the Analysis.

Terms, Cash and one per cent. commission for buying and forwarding.

A register will be kept of the Analysis of every cargo of Guano imported into London that is brought in the market.

Price-current, London, Sept. 7, 1844:—

COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, Sept. 7, 1844.

TO FLORISTS AND ADMIRERS OF FLOWERS.

BRAIN'S CONCENTRATED LIQUID GUANO, for the Garden, Shrubbery, Hothouse, and Conservatory.

This preparation is peculiarly adapted for the development of Flowers, furnishing them with the materials (in a soluble form) out of which they weave their delicate tissues and elaborate their beauteous colouring. It has no unpleasant smell, is easily applied, and thus recommends itself, either for the Garden or Drawing-room.—Price 1s. 2d. per quart Bottle, and may be had of WM. JACKSON, late Geo. Butler, 93, Cheapside, corner of King-street, and most respectable Druggists and Seedsmen, with full directions for use inclosed.—Works, Thomas-st., Stamford-st., blackfriars-rd.

IMPORTANT TO AGRICULTURISTS, &c.

ANALYSES of SOILS, MANURES, and all AGRICULTURAL PRODUCTS, are conducted by Messrs. MITCHELL and FIELD (late Mr. Mitchell), Analytical Chemists, with the view of ascertaining whether the Soil, in which it is proposed to grow any particular crop, contains all that is necessary to produce a luxuriant vegetation; also to estimate the relative value and purity of Manures, and the comparative worth of Farm Produce in general. Gentlemen instructed in Agricultural Chemistry. The course will comprehend the Elements of Analysis.—No. 5 A, Hawley-road, Kentish Town.

HATCHER'S BENNENDEN TILE-MACHINE, Manufactured and Sold only by COITAM and HALLEN, Engineers, Agricultural Implement Makers, &c., 2, Winsley-street, Oxford-street, London.

This is the most efficient Machine that has been invented for the purpose of making Drain Tiles. Any shaped Tile can be made by merely changing the die, which can be done in a few minutes. It requires but few hands, viz., one man and three boys. With this amount of labour, the product of a day of 10 hours is as follows, viz.:—

1 inch diameter of Tile,	11,000	1¾ inches diameter of Tile,	5,800
1¼ ,, ,, ,,	8,000	2½ ,, ,, ,,	3,200

The Machine is movable down the drying-sheds, so that it requires no extra boys to carry the Tiles, nor are shelves required in drying. It has been in full operation for upwards of four months at Hempstead Park, near Cranbrook, Kent. No charge made for Patent dues or licence. The purchase of the Machine includes free use of it.

70, STRAND, LONDON.

RAMS FOR RAISING WATER WITHOUT LABOUR, where a fall can be obtained. FOUNTAIN BASINS IN IRON, &c.

F. ROE having purchased all the Patterns of Basins, Jets, &c. formerly belonging to W. Rowley, Fountain Maker to the Royal Family, is enabled to offer the above article in iron, which will stand the Frost and last for ages. A Ram and Fountain Jets fixed on the premises for inspection. Every kind of Garden and other Pumps, Well Engines, Baths, &c. Houses, &c. Heated by Hot Water.

WATER RAM.

TO COLONISTS, EMIGRANTS, &c. — Mrs. MARY WEDLAKE, widow of the late THOMAS WEDLAKE, at 118, FENCHURCH STREET, CITY, informs Emigrants and others that she continues to manufacture those Agricultural Implements for which her late husband was so extensively patronised by the Settlers of South Australia, Van Diemen's Land, Swan River, New Zealand, and other British Colonies. The following articles, made in a very superior manner, are kept on sale at the London Warehouse, viz.:—

Patent Hay-making Machines	Flour-Mills—Bean-Mills
Dressing Machines	Patent Essex Ploughs, 30 sorts
Patent Chaff-cutting Machines	Subsoil Ploughs [Colonies
Oil-Cake Crushers	Threshing Machines for the
Double action Turnip-cutters	Drills of all kinds—Scarifiers
Railway Wheels	Vacuum Pumps

Please to be particular in the address, MARY WEDLAKE, 118, Fenchurch Street, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient Protective Material to Plants, and is now in use at the Royal Horticultural Society's Gardens, Chiswick. It can be had of any length, 32 inches wide, at 1d per foot, super. A discount to the trade. THOS. J. CRUDGEN, 8, Ingram-court, Fenchurch-st., London.

TO LANDOWNERS, AGRICULTURISTS, BUILDERS, ARCHITECTS, &c.

McKIBBIN'S Improved ROOFING FELT is peculiarly applicable as a substitute for Slate, Zinc, Tiles, and other articles used for Roofing, from its ECONOMY, LIGHTNESS, and DURABILITY.

The disadvantages attending other materials used in roofing, preventing, in agricultural districts, many useful houses and sheds being erected or rendered waterproof, it is submitted that the improved Roofing Felt will in a great measure—and in some instances altogether—obviate them, and prove most serviceable from its lightness, durability, and impermeability to water and damp, in covering Houses, Cattle-sheds, Workshops, Ropewalks, &c., and for the sides, as well as roofs, of light structures for plants, being likewise a non conductor of heat; besides its economy in repairs, the timber where it is used may be so light as to save its whole expense; it requires no other coping, and may be applied by any person of common ingenuity; being flexible and portable also, it is free from breakage, the expense of carriage is inconsiderable in comparison with slates, tiles, &c., and it is not liable to contraction like zinc.

Sold in sheets 32 inches by 20, at 5d. each (being less than 9s. 6d. per square of 100 feet), with printed directions for applying them.

Orders will meet with prompt attention if addressed to H. C. BOWDEN, 18, East India Chambers, Leadenhall street, London, or to the following agents:—Liverpool, Messrs. Grucber & Co., 11, Manesty-lane; Plymouth, Thomas Stevens, Esq.; Birmingham, William R. Loyd, Esq.; Sunderland and Newcastle-on-Tyne, Messrs. John Ritson and Sons; Hull, William Ward, Esq.; Bristol, Messrs. Moor and Hewatts; Ramsgate and Deal, Messrs. Edward Hoeges & Co.; Whitehaven, William Todd, Esq.; Glasgow, Malcolm Carmichael, Esq., St. Enoch-square; Cork, Messrs. Richard Wallis & Co.; Belfast, Messrs. Grueber & Co., Dunbar's Dock; who have also on sale McKIBBIN'S improved SHEATHING, BOILER, RAILWAY, and other FELT.

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June* 6, 1844.—The cabin of the Great Western has been regularly supplied with LEA & PERRINS's Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers for its capital flavour, and as the best accompaniment of its kind for a voyage. (Signed) JAMES HOSKEN."

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup: giving a zest far superior to the long-established favourites; more wholesome and of less cost."—*Naval and Military Gazette*, April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS, Worcester; Messrs. BARCLAY and SON, Farringdon-street; and the principal Oil and Italian Warehousemen in London; and Retail by the usual venders of Sauces.

SILVER PLATED DISH COVERS.—A. B. SAVORY and SONS, Manufacturing Silversmiths, 14, Cornhill, opposite the Bank of England, submit for choice in their Plate-rooms many patterns of SILVER PLATED DISH COVERS, of Sheffield Manufacture, from 15 to 20 guineas the set, viz.:—

Double Dome Pattern. Size.	£ s. d.	*The Melon Pattern.* Size.	£ s. d.
1 Pltd Dish-cover, 20 in.	5 13 6	1 Pltd. Dish-cover, 20 in.	5 17 0
1 ,, Dish-cover, 18 in.	4 7 6	1 ,, Dish-cover, 16 in.	4 14 6
2 ,, Dish-covers, 14 in.	5 12 0	2 ,, Dish-covers, 14 in.	6 6 0
Per set	£15 13 0	Per set	£16 17 6

The above have silver handles and mountings, and silver shields for engraving the crest or coat of arms. A price current, illustrated by drawings, and containing every information relative to the purchase of silver or Sheffield plate, may be had on application, or will be sent into the country, free of postage, in answer to a paid letter.

EXTIRPATION of all kinds of VERMIN.—Office, 69, King William-street, city, London.—Mr. J. A. MEYER, practical chymist, patronised by Her Majesty the Queen, H.R.H. the Duchess of Kent, the Royal Agricultural Society of England, and the Corporation of the City of London, and by special appointments to the principal Courts of Europe, begs to inform the nobility, gentry, merchants, agriculturists, shipowners, and the public generally, that he continues to CLEANSE, by contract, from one to five years, every description of PROPERTY, of rats, mice, moles, weasels, moths, fleas, bugs, &c., and as a guarantee of the efficacy of his preparation, respectfully refers to the certificates of his great success at Buckingham Palace and Gardens, Windsor Castle, St. James's Palace, Frogmore Lodge, Carlton Club House, Mansion House, Newgate Prison, Tavistock Hotel, Brewers, Chester, and Gallery Quays and warehouses in Lower Thames-street, the property of Joseph Barnet, Esq., and many others of public and private establishments, which may be seen at the office. The preparations, which are free of poison or deleterious drugs, may be had as above, in pots and bottles at 5s., 10s., 20s., 50s., and 100s. each, with full directions, which must be used in proportion to the extent of premises infested, to successfully eradicate the vermin, and which can be applied without injury to property. Dwelling-houses cleansed from 1l. to 5l. per annum; mansions and estates from 10l. and upwards; ships, docks, warehouses, granaries, breweries, farms, wharfs, &c., in proportion. Caution.—None are genuine unless bearing the signature and seal "Joseph Anton Meyer."

On the first of November will be published,

JOHNSON AND SHAW'S FARMERS' ALMANAC for 1845. Suggestions for its improvement and corrections are earnestly requested. All Advertisements for its advertising sheets must be sent by the first of October, to the Publisher, J. RIDGWAY, 169, Piccadilly.

HORTICULTURAL SOCIETY OF LONDON.

This Day is Published, price 3*s.* 6*d.* to Fellows of the Society, and 5*s.* to others.

A CATALOGUE OF THE FRUITS Cultivated in the Garden of the HORTICULTURAL SOCIETY OF LONDON. Third Edition. Sold by LONGMAN & Co., Paternoster-row; J. HATCHARD, Piccadilly; RIDGWAY, Piccadilly; RIVINGTONS, Waterloo-place; and by the principal Booksellers in all parts of the Empire.

A few copies of the Second Edition of this Catalogue may be had at the reduced price of 1*s.* 6*d.* each.

LITERARY LEAVES; or, Prose and Verse. By DAVID LESTER RICHARDSON. 2 vols. 8vo, Second Edition, price 12*s.*

"We strongly recommend this second and enlarged edition. We can easily imagine how such writings as these, appearing from time to time in the Indian journals, must have gratified the English residents, since even here, in the midst of lions and new books, we run over the leaves with unmixed pleasure."—*Atlas.*

"His poetry derives, from his unfeigned attachment to home, a very touching beauty. Most persons who have been long absent from the place of their birth know how delicious is the feeling with which it is approached. Mr. Richardson describes this feeling with exquisite truth and tenderness .... Whatever forms of nature challenge his preference, he views them all with a poetical eye, and paints them in his verses with vividness and fidelity. We should be glad to see the poetry of these volumes detached from the prose, and sent into the world alone. It has sufficient character in it to depend on its own vitality; and we venture to predict that it will live."—*Sunday Times.*

"The essays afford some exquisite reading. We can with perfect confidence refer every man of literary taste to these volumes, which we consider an elegant and valuable contribution to the literature of our country."—*Indian News.*

"The poems are largely impregnated with Nature's best and holiest feelings. They are utterances of the writer's own heart, and they reach the hearts of his readers. They leave an impression which will not be easily or speedily effaced. The diction is in keeping with the sentiments; it is at once accurate and graceful. The same observation applies to the author's prose writings."—*Observer.*

SMITH, ELDER, AND Co., Cornhill, London.

Just published, the Thirteenth Edition, price 2*s.* 6*d.*; free by post, 3*s.* 6*d.*,

THE SILENT FRIEND ON NERVOUS DEBILITY, CONSTITUTIONAL WEAKNESS, &c. By R. and L. PERRY and Co., Surgeons, London. (two doors from Argyll-st.), London. The Cordial Balm of Syriacum is a stimulant and renovator in all Spasmodic complaints. Nervous Debility, Indigestion, Asthma, and Consumption, are gradually and imperceptibly removed by its use, and the whole system restored to a healthy state of organisation. Sold in bottles, price 11*s.* and 33*s.* PERRY'S Purifying Specific Pills have long been used as the most certain remedy for Scorbutic Complaints of every description, Eruptions of the Skin, Pimples on the Face, and other disagreeable affections, the result of an impure state of the blood. These Pills are perfectly free from mercury and other deleterious drugs, and may be taken with safety without interference with, or loss of time from business, and can be relied upon in every instance. Sold in boxes, at 2*s.* 9*d.*, 4*s.* 6*d.*, and 11*s.*, by all Medicine Venders.

Messrs. PERRY and Co. may be consulted daily at their residence, 19, Berners-street, Oxford-street, from 11 till 2, and from 5 till 8. On Sunday, from 10 till 12.

ADVERTISEMENTS IN THE MONTHLY JOURNAL OF MEDICAL SCIENCE, Edited by Dr. CORMACK. Few Periodicals present such advantages to the Advertisers of Medical and Scientific Publications, Works in General Literature, Medical Practices, Chemical Products, Pharmaceutical Preparations, the Prospectuses of Life Insurance Societies, &c. The circulation is large, and has from its commencement gone on steadily increasing in Great Britain, Ireland, India, America, and the Continent of Europe. It is taken in by many General News-rooms, by almost all of the Reading Clubs and Medical Societies in Town, and by a very large proportion of Country Practitioners, in England, Scotland, and Ireland, to whom, from its cheapness and comprehensive character, it is specially adapted. Advertisements inserted in this Journal must be seen by many thousands of the most select class of readers.

*** For the SCALE OF CHARGES, and all other particulars, reference may be made to Mr. Churchill, Princes-street, Soho, London; Messrs. Maclachlan, Stewart, and Co., South-bridge, Mr. Jack, Niddry-street, Messrs. Harthill and Son, Waterloo-place, and Mr. Seton, Head of the Mound, Edinburgh; Messrs. Fannin and Co., Dublin; most News Agents in Great Britain; and Messrs. Fortin, Masson, et Cie. Paris.

TWELVE CHAPTERS on NERVOUS or MIND COMPLAINTS, and on the new and most important Discoveries by which groundless fears, suspicions, inquietude, confusion, blushing despondency, indecision, irresolution, headache, vertigo, loss of memory, delusion, inaptitude for society, study, business, &c., blood to the head, restlessness, wretchedness, thoughts of self-injury, &c., and all other nervous symptoms can be cured, as certainly as water quenches thrist. By the Rev. Dr. WILLIS MOSELEY.

"This is the best book on nervousness."—*Professor Savage.*

SIMPKIN and Co., Sationers'-court, and all Booksellers.

KNIGHT'S WEEKLY VOLUME FOR ALL READERS.—PRICE ONE SHILLING.

The publication of this Series commenced on Saturday the 29th of June, and will be continued every succeeding Saturday. The following Works will appear in the course of September.

Sept. 7th. BIRD ARCHITECTURE. By James Rennie.

14th. THE ENGLISHWOMAN IN EGYPT. By Mrs. Poole. Vol. II. completing the work.

21st. THE CHINESE. By J. F. Davis, Esq., Governor of Hong-Kong. Vol. III. completing the work.

28th. FAIRFAX'S TRANSLATION OF TASSO'S JERUSALEM DELIVERED. With Lives of Tasso and Fairfax. Vol. II. completing the work.

London: CHARLES KNIGHT & Co., 22, Ludgate-street.

THE HORTICULTURAL MAGAZINE.—On the 1st of October will be published, price One Shilling, the INTRODUCTORY NUMBER of this new periodical.—Orders received by all booksellers. It is earnestly requested that members of Horticultural Societies, and all persons who take an interest in a garden, will forward to the Editor the results of their experiments and practice.—Office, 154, Strand, London, where advertisements and communications for the Editor may be forwarded.

To the Nobility and Gentlemen of the United Kingdom of Great Britain and Ireland, and to their Gardeners, Land Stewards, Foresters, and Farm Bailiffs.

THE UNITED GARDENERS' and STEWARDS' JOURNAL; or, The NOBLEMAN'S and GENTLEMAN'S CULTIVATOR of the GARDEN, the FARM, and the FOREST. A Weekly Journal of the Contributions of a combination of the Cultivators of the Earth and her Products, conjointly with the ordinary News of the Day, will be published on SATURDAY, the 4th of JANUARY, 1845, providing a sufficient number of Subscribers come forward to enable the Society to do so; the proceeds of which are intended to form a Fund for the Relief of Aged and Indigent Gardeners, Land Stewards, Foresters, and Farm Bailiffs, and for their Widows and Orphans.

The Gentlemen's Gardeners have long complained that, while every other profession has its "club" for the relief of their unfortunate brethren, they have nothing of the kind, which in all probability has hitherto arisen from their isolated situations.

The Gentlemen's Gardeners, however, now perceive that the only way of accomplishing this object is by a union for mutual instruction on a charitable foundation. The Landstewards and Bailiffs, seeing the probable utility of such an undertaking, have proposed to join the Gardeners, which proposition has been accepted by them, as their contributions on Stock and Stock-farming will make the Journal more acceptable to the general cultivator.

The London Committee, now formed of some of the leading gardeners and stewards in that neighbourhood, is about forming Sub-Committees of the principal gardeners and stewards in every county and division of counties in the kingdom, to assist it in the management of the Charity.

We have been advised to write an appeal to the feelings of the Nobility and Gentry in behalf of our Charitable Institution; but as such addresses are every-day performances, which have been hackneyed on the stage for ages, we think it by far the most original course to adopt such measures as are sure to meet their approbation, and secure their patronage and esteem.

To Advertisers, the Journal will offer the lowest possible charges for everything connected with Horticulture, Agriculture, Floriculture, and Arboriculture, and all new inventions either of Manure or Implements.

The plan hitherto adopted in this business has been, that every Member has paid a Quarter in advance (6*s.* 6*d.*), but now arrangements are so far advanced with our printer, that persons who scruple to do so, until they have received the first Number of the Journal, will oblige by forwarding their addresses.

All letters and parcels for the Journal to be addressed to the care of our Printers, VIZETELLY BROTHERS & Co., Peterborough Court, Fleet-street.

Price 7*s.*, Illustrated with Wood-cuts of Birds, Cages, &c.

NATURAL HISTORY OF CAGE BIRDS; their Management, Habits, Food, Diseases, Treatment, Breeding, and the Methods of Catching them. By J. M. BECHSTEIN, M.D.

"It will be welcome to every gentleman's library or drawing-room table. It is superbly got up, with an immense number of vignettes, and, in fact rivals the beauty of the Annuals."—*Weekly Dispatch.*

"A very delightful book of its kind. .... It seems to us an indispensable book for the bird-fancier."—*Spectator.*

London: W. S. ORR and Co.; and W. R. CHAMBERS, Edinburgh.

TO SPORTSMEN, TOURISTS, &c.

BERDOE'S SUPERIOR WATERPROOF FROCKS, SHOOTING-JACKETS, GARMENTS for the SEA-SIDE, &c.—An extensive variety of the above, in NEW and greatly improved materials always ready, guaranteed to exclude any rain whatever, and confidently recommended to those who regard a respectable appearance, or wish to avoid the disappointment and vexation consequent upon purchasing articles made by slopsellers, and sold by parties not Tailors.

FIRST-RATE CLOTHING of every description, upon the lowest terms possible, consistent with TRUE economy, and ultimate satisfaction.—W. BERDOE, Tailor, Waterproofer, &c., 69, Cornhill (north side).

EXTIRPATION of the MEALY-BUG, THRIPS, &c.—These pests to Gardens can be readily and effectually extirpated without injury to the most delicate plants, by HEREMAN'S VEGETABLE DILUTIUM, sold in bottles at 5*s.*, 10*s.*, and 20*s.* each, free of carriage to all parts of Great Britain.—Address, with a remittance, either to SAMUEL HEREMAN, Romsey, Hants, or Messrs. MARNOCK and MANLY, Nurserymen, &c., Hackney, who are the sole London Agents.

SIX POUNDS OF TEA, whether Black or Green, for 17*s.*; and small bright Gunpowder, in 12 lb. boxes, at 4*s.* 6*d.* per lb. East India Tea Company's Offices, 9, Great St. Helen's Churchyard, Bishopsgate-street.

TERRA COTTA FIGURES, VASES, FOUNTAINS, &c. Manufactured by DOULTON and WATTS, LAMBETH POTTERY, High-street, Lambeth, London.

D. and W., from their experience as Potters, have made considerable improvements in the manufacture of Terra Cotta, the superiority of which over Artificial Stone or Cement is well known. It is subjected to a high degree of fire, which renders it imperishable, and gives it a sharpness and surface which no changes of temperature can impair.

D. and W. are enabled to offer the Terra Cotta at a considerable reduction in price; and Drawings and Designs will be forwarded Gratis, on application.—Architectural work executed.

HOTHOUSES, CONSERVATORIES, &c., made and fixed Complete in all parts of the Kingdom. One, two, and three-light Cucumber and Melon-Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from 1*l.* 8*s.* Garden-Lights made and glazed from 1*s.* per foot, at JAS. WATTS' Sash Manufactory, Claremont-place, Old Kent-road. *** Reference given.

ROWLAND'S ODONTO, OR PEARL DENTIFRICE, patronised by "Her MAJESTY," H.R.H. Prince ALBERT, the Royal Family, and the several Courts of Europe. A FRAGRANT WHITE POWDER, prepared from Oriental Herbs of inestimable virtue, for strengthening, preserving, and cleansing the teeth. It eradicates the factitious formation of tartar, and by the removal of that extraneous substance lends a salutary growth and freshness to the gums. It removes from the surface of the teeth the spots of incipient decay, polishes and preserves the enamel, substituting for discolour and the aspect of purity, the most pure and pearl-like whiteness; while, from its salubrious and disinfecting qualities, it gives sweetness and perfume to the breath, bestowing at once cleanliness, and the appearance and reality of health. Price 2*s.* 9*d.* per box, duty included.

CAUTION.—To protect the public from fraud, the Hon. Commissioners of Her Majesty's Stamps have authorised the Proprietors' Signature to be engraved on the Government Stamp thus,—A. ROWLAND and SON, 20, Hatton Garden, which is affixed to each Box. Ask for ROWLAND'S ODONTO. Sold by them, and by Perfumers and Chemists.

*** All others are SPURIOUS IMITATIONS.

Auditors.—J. H. Forbes, Esq.; Geo. Hankey, Esq.; Thomas Lawrence, Esq.
Physicians.—Dr. James Johnston, 8, Suffolk-place, Pall Mall East; Sir C. F. Forbes, M.D., K.C.H., 23, Argyll-street.
Surgeon.—Samuel Solly, Esq., F.R.S., 1, St. Helen's-place.
Standing Counsel.—Charles Ellis, Esq.
Solicitors.—Messrs. Hale, Boys, and Austen.
Bankers.—Bank of England. *Actuary.*—J. M. Rainbow, Esq.

THE ADVANTAGES OF THIS OFFICE, among others, are:
1. A participation septennially in two-thirds of the profits, which may be applied either in reduction of the Premium, or to augment the sum assured. The following Bonuses have been assigned to all Policies, of at least three years' standing, effected for the whole duration of Life:—First Division, in 1832—From 18*s.* to 2*l.* 12*s.* per cent. per annum on the sums assured, varying with the age, being equivalent, on the average, to 26½ per cent. on the Premiums paid. Second Division in 1839—From upwards of 1*l.* to upwards of 3*l.* per cent. per annum on the sums assured, or, on the average, 33 per cent. on the Premiums paid for the preceding seven years.
2. Premiums may be paid in a limited number of annual sums, instead of by annual payments for the whole of life; the Policy continuing to participate in Profits after the payment of such Premiums has ceased.
3. The Assurance or Premium Fund is not subject to any charge for Interest to Proprietors.
4. Permission to pass to Continental Ports between Brest and the Elbe inclusive.
5. Parties (including Officers of the Army, Navy, East India Company, and Merchant Service), may be assured to reside in or proceed to all parts of the world, at Premiums calculated on real data.
6. Claims to be paid within three months.
7. The Assured may dispose of their Policies to the Company.
8. No charge but for Policy Stamps.

The Prospectus, Tables of Rates, &c. to be had at the Office in London, or of the Company's Agents. T. G. CONYERS, Sec.

BRITISH MUTUAL LIFE ASSURANCE SOCIETY,
17, NEW BRIDGE STREET, BLACKFRIARS.

Directors.

John Atkinson, Esq., Well-st., Hackney.
Joshua Burgess, Esq., Park-st., Grosvenor-square.
George Godwin, Esq., F.R.S., F.S.A., Pelham Crescent, Brompton.
Captain C. Twistleton Graves, Army and Navy Club.
Nutter Gray, Esq., Hackney.
Thomas Hamber, Esq., Barnsbury Park.

Bankers—Messrs. Masterman & Co., Nicholas-lane, Lombard-st.
Physician—R. Hopkins, Allnatt, Esq., M.D., F.S.A., Parliament-st.
Surgeon—Robert Grueber, Shute, Esq., Mecklenburg-sq.
Standing Counsel—Harris Prendergast, Esq., Lincoln's Inn; Joseph Brown, Esq., Temple.
Solicitor—Edward Smith, Esq., 5, Chancery Lane.
Surveyor—John Barnett, Esq., Chancery Lane.
Consulting Actuary—W. Ratray, Esq., King William-st., City.

THE GREATEST PRESENT BENEFIT, AND THE GREATEST FUTURE ADVANTAGES to those who attain the average duration of Life are secured to the Assured in this Office, *a combination of advantages presented by no other in London.*

This Society is strictly a Mutual Assurance Society.

The principle adopted in the distribution of the profits is *peculiar to this Office*, and is at once safe, equitable, and favourable to good lives. The surplus is reserved for those Members who survive the period at which their premiums, with accumulated interest at 5 per cent., shall amount to the sums assured, and may be received in cash, or applied in the reduction of the future premiums, or to the increase of the sum assured.

An ample Guarantee is secured by a temporary subscribed Capital to be paid off as soon as it may be deemed expedient.

The Premiums are deduced from the Government experience, and are accurately adjusted to the several ages. At early and middle life they are about *one-fourth lower than at most other offices.*

All the objects of Life Assurance may be effectually accomplished at this Office, and generally the Directors are prepared to receive proposals of any description involving the contingency of human life.

More fully to extend the advantages of the Society, it is determined to establish LOCAL BOARDS throughout the Kingdom.

Every facility and information afforded on application at the Office,
17, New Bridge-street, Blackfriars,
CHARLES JAMES THICKE,
17, New Bridge-street. Resident Secretary.

VICTORIA LIFE ASSURANCE COMPANY.—
Trustees.—Sir Jas. Duke, Ald., M.P., Chairman.
Benjamin Hawes, Esq., Deputy Chairman.
Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—
Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.
Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.
On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.
Advances made to assurers on real or undoubted personal security, for terms of years, re-payable by instalments.
Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary.
WILLIAM RATRAY, Actuary and Secretary.

NORTH BRITISH INSURANCE COMPANY,
Established 1809. His Grace the Duke of Sutherland, K G., President; Sir Peter Laurie, Alderman, Chairman of the London Board; Francis Warden, Esq. (Director H.E.I.C.), Vice Chairman; John Webster, M.D., F.R.S., 24, Brook street, Physician.

THIRD DIVISION OF PROFITS.

The Third Septennial Investigation of the Company's Affairs will take place on the 31st December next. Parties joining the Profit Scheme in the interim, will participate in the Bonus to be then declared.

This Institution is incorporated by Royal Charter, and is so constituted as to afford the Benefits of Life Assurance in their fullest extent to Policy Holders, combined with perfect security, in a fully subscribed Capital of One Million Sterling, besides an Accumulated Premium Fund, exceeding Four Hundred Thousand Pounds, and an Annual Revenue of Eighty-seven Thousand Pounds.

Fire Insurances may be effected on Private Houses, Country Mansions, &c., at the lowest rate of Premium.

A Prospectus, containing Tables of Premiums, with the names of the President, Vice Presidents, Directors, and Managers, who are all responsible Partners, may be obtained of Messrs. B. and M. BOYD, 4, New Bank Buildings, or of the Actuary, 10, Pall Mall East. JOHN KING, Actuary.

News of the Week.

THE trial of Mr. O'Connell and the other state prisoners, which has for so many months occupied public attention, has been brought to a conclusion unexpected, it would seem, by the Government and by the prisoners themselves. The House of Lords, or rather the law lords to whom the House had delegated its powers as a Court of Appeal, have reversed the sentence of the Irish Court of Queen's Bench by a majority of 3 to 2, and Mr. O'Connell and his fellow-traversers are consequently released from the prison in which they have already been confined for 13 weeks. The law lords who voted for the reversal of the sentence were Lord Denman, Lord Cottenham, and Lord Campbell; those who voted against it were the Lord Chancellor, and Lord Brougham. Lord Langdale was absent, but it is understood that if he had attended he would have voted with the majority. Several of the lay lords who attended the House were prepared to vote on the question of judgment, but Lord Wharncliffe, the Lord President of the Council, intreated them to abstain from voting, on the ground that, though their opinion might be at variance with the majority of the law lords, the character of the House might suffer as a Court of Appeal if those who had not heard the whole case, and who, in fact, were not qualified to judge of its legal merits, should take any part in its decision. Previous to the judgment of the House, the nine Judges attended and gave their opinions on the points of law submitted to them. The general bearing of these questions was on the validity of a judgment expressed in general terms upon the whole of an indictment containing good counts and bad, and whether such a judgment could be reversed upon a writ of error. In answering them the Judges unanimously decided that those counts which the Irish Court of Queen's Bench pronounced to be unexceptionable were bad in law, so that on these points the English Judges and the Irish Judges were at issue. On the other counts the English Judges could not agree. Two of them, including Baron Parke, were of opinion that a judgment given on bad and good counts ought to be reversed, while Lord Chief Justice Tindal, and the six other judges, decided that the judgment was not affected by the bad counts, and that therefore it ought not to be reversed by a writ of error. In confirmation of this view the Judges stated that it was in conformity with a general impression which has prevailed upon the subject in Westminster Hall, from the time of Lord Mansfield to the present period. The judgment of the House of Lords, however, is at direct variance with this impression, and as this was the first occasion on which the question had ever been presented to the House, the result may possibly have an important influence on the future administration of the law.—After a long-protracted Session, Parliament was prorogued on Thursday, by commission. The Speech from the throne presents no topic of interest, except the announcement that friendly relations have been re-established with France, and that the questions which threatened to disturb them have been settled in a manner consistent with the honour and interest of both countries. Allusion is made to the legislative labours of the past Session, but only one Act, the Bank Charter Bill, is mentioned by name. There is not a word on the affairs of Ireland, or on any of the other questions of exciting interest, which have recently occupied attention. In the Commons, Sir R. Peel renewed the assurances of the Speech on our foreign relations, stating that the Tahiti affair had been satisfactorily arranged, but declining at present to enter into details.

From France we have the despatches of the Prince de Joinville and Marshal Bugeaud, describing their recent victories in Morocco. No advance has yet been made towards a settlement of differences, but it is expected that the Emperor, seeing the hopelessness of further resistance, will accede to the terms already offered by the French Government. At all events, it appears that hostilities will be suspended for the present, and that the occupation of the island of Mogador will terminate the campaign for this year, or until the effect produced upon the Emperor by the event can be ascertained.

Home News.

COURT.—Her Majesty, Prince Albert, and the Royal family continue at Windsor Castle, and are in excellent health. The Prince of Prussia arrived on Saturday on a visit to the Queen, and on Sunday attended Divine Service in the private chapel of the Castle. On Monday the Queen, accompanied by Prince Albert and the Prince of Prussia, took an airing in an open carriage. In the morning his Royal Highness and Prince Albert shot over the Royal preserves. On Tuesday their Royal Highnesses inspected the Royal buckhounds. Her Majesty afterwards held a Privy Council, which was attended by all the Ministers and great Officers of State. At this Council the Queen's speech on closing the session of Parliament was agreed upon. The Queen afterwards rode out in a pony carriage, accompanied by Prince Albert and the Prince of Prussia. On Wednesday Her Majesty walked out in the grounds around the Castle, and afterwards rode in the garden chair. The Prince of Prussia and his suite took their departure from town on the same day. On Thursday Prince Albert came to town to attend the review in Hyde Park. After the review his Royal Highness returned to Windsor. The Prince of Prussia paid his farewell visit to the Queen yesterday afternoon, and will leave Windsor this day. The christening of the infant Prince took place yesterday in the private chapel of the Castle; the details of the ceremony, and of the banquet given in the evening by Her Majesty in honour of the event, will be given in our next. The visitors to Her Majesty during the week, in addition to the Prince of Prussia and his suite, have been Count Nesselrode and his son, the Duke of Wellington, the Earl of Aberdeen, the Earl of Liverpool, Earl and Countess of Jersey and Lady C. Villiers, Earl and Countess of Westmoreland, Earl and Countess Delawarr and Lady Mary West, Viscount Melbourne, the Baron de Berg, and Sir Robert and Lady Peel. Lord Charles Wellesley (Clerk Marshal) has succeeded the Hon. Colonel Grey as Equerry in Waiting on the Queen, and Major-General Sir E. Bowater has succeeded Colonel Wylde as Equerry in Waiting on Prince Albert.

Her Majesty's Marine Excursion.—On Monday, four of the Royal carriages, and sixteen horses, with a number of pointer dogs, were shipped on board the steam ship London, for Dundee, and are to reach Blair Athol Castle by Monday next. The present arrangements are for the Queen and Prince to take their departure from the Castle on Monday, and embark at Woolwich on the same day in the Victoria and Albert yacht, proceeding direct to Dundee, without touching at any of the ports on the eastern coast. It is expected that the Princess Royal will accompany the Queen, and that the rest of the Royal children will remain at the Pavilion at Brighton until Her Majesty's return. It is said that Her Majesty will return from Scotland early in October, when, notwithstanding what has been stated to the contrary, there is reason to expect that the King of the French will come over to England on a visit to Her Majesty. After this it is said that the Queen and Prince Albert will honour the Duke and Duchess of Norfolk with a visit at Arundel Castle.

THE PRINCE OF PRUSSIA.—His Royal Highness, accompanied by the Duke of Beaufort and the members of his suite, left Badminton at an early hour on Saturday morning, for the Chippenham station of the Great Western Railway, where a special train was in attendance to convey the Royal party to Bristol. On arriving at that city, the Prince proceeded to the Dock basin, for the purpose of inspecting the Great Britain colossal steam-ship. His Royal Highness then visited Leigh Court, the seat of Mr. Miles, and inspected that gentleman's fine collection of paintings. From thence the Royal party went to Kingsweston, the seat of Mr. Miles, jun., M.P., and subsequently drove to Blaise Castle, the seat of Mr. Harford, where they partook of a *déjeúner*, and afterwards returned to Bristol, where a special train was in readiness to convey his Royal Highness to Slough. The Prince arrived at Windsor Castle in two hours and a half, on a visit to the Queen, and remained at the Castle until Wednesday, when he returned to town, and took up his residence at the Prussian Embassy, in Carlton Gardens. On his arrival the Prince visited the manufactory of Messrs. Austen and Seely, in the New Road; the Chinese Exhibition, the Slate Manufactory in the Belvidere Road, Mr. Babbage's Calculating Machine at Somerset House, and the Surrey Zoological Gardens; and in the evening was present at the performances at Astley's, and at the Lyceum. On Thursday His Royal Highness, accompanied by Prince Albert, the Duke of Cambridge, and the Duke of Wellington, reviewed the Household troops in Hyde Park. After the review the Prince proceeded to the House of Lords to witness the prorogation of Parliament, and in the course of the day visited the Establishment of Messrs. Mortimer and Hunt, in Bond-street, the Model Prison, St. Paul's Cathedral, Guildhall, the General Post-office, the Polytechnic Institution, &c. His Royal Highness left town for Windsor yesterday, on a farewell visit to the Queen, and will embark this evening at Woolwich for the Continent.

Cabinet Councils.—On Tuesday a Cabinet Council was held at the Foreign Office, which was attended by all the Ministers, those who were absent in the country having come to town for the purpose of attending it. The Council sat 2½ hours, and at its close the Ministers left town for Windsor to attend a Privy Council. On

Wednesday, after the House of Lords had pronounced judgment on the Writ of Error in the case of the O'Connell trials, another Cabinet Council was held and attended by all the Ministers. The Council sat 2¼ hours.

Parliamentary Movements.—A vacancy has occurred in the representation of North Lancashire by the retirement of Lord Stanley, who is about to be called to the House of Peers by writ of summons.

Foreign.

FRANCE.—The relations between Great Britain and France have materially improved during the last few days, and the rumours of war which were current a week ago have now become less general on both sides of the Channel. Sir R. Peel, on Thursday, in Parliament, set at rest all speculation on the subject, by stating that the Tahiti affair has been satisfactorily arranged, and that friendly relations have been re-established between the two countries. The terms of the arrangement are not known, but by the last accounts from Paris the French Cabinet is understood to have sent to that of Great Britain its *ultimatum*, in declaring that it deemed the satisfaction given by the removal of M. d'Aubigny from Tahiti by his superior, Captain Bruat, and the expression of regret at, and disapproval of his conduct by the Government, to be sufficient, as between the two Governments, for the outrage committed upon Mr. Pritchard, but that some compensation should also be made to that gentleman for the private wrongs he had suffered. No divergence of opinion existed on the subject in the Cabinet. M. Guizot and Marshal Soult were in perfect accord on the matter. The other Ministers would concur in or follow their ulterior movements. It is said to be a mistake that the British Government has formally demanded any satisfaction from that of France. Up to the present moment Lord Aberdeen has, it is stated, confined himself to placing before the French Government the facts of the occurrences at Tahiti as stated to him by Mr. Pritchard, and as narrated in the despatches from other parties bearing on the subject. The reply of the French Government to this representation is not, however, the less specific. It charges Mr. Pritchard with acts and proceedings which, they contend, would have justified his removal even from France, and *à fortiori* consequently from Tahiti, which M. d'Aubigny believed, at the moment, constituted a portion of the French territory; and then they offered the removal of M. d'Aubigny in atonement for—not the removal of Mr. Pritchard, but of the violence practised upon him by M. d'Aubigny. The terms in which Sir Robert Peel characterised the conduct of the French authorities at Tahiti suggested fears that the atonement so offered would not be deemed sufficient, and hence considerable alarm still exists in Paris on the subject.—Since our last, the French Government have published the official despatches of the Prince de Joinville respecting the bombardment of Tangiers and Mogadore, and those of Marshal Bugeaud respecting the battle of Isly. The Prince's account of the affair of Tangiers adds nothing to what is already known to our readers, but that from Mogadore, dated Aug. 17, is of greater interest, and we therefore make the following extracts recording the main features of the bombardment:—"I arrived before Mogadore on the 11th inst.; the weather was extremely bad, and during several days we remained at anchor before the town without having been able to communicate even amongst ourselves. Notwithstanding we had let out 200 fathoms of chain cable, our anchors broke like glass. In fine, on the 15th, the weather having become moderate, I took advantage of the change to attack the town. The ships of the line Gemappes and Triton proceeded to take up a position opposite the western batteries, with orders to batter them, and to open a fire against the rear of the marine batteries. The Suffren and the Belle Poule took their station in the northern channel. It was 1 o'clock P.M. when our movement commenced. The moment the Arabs saw the ships approaching the town, all the batteries commenced firing. We waited to return the fire until each vessel was at its post. At half-past 4 the firing began to slacken; the brigs Cassard, Volage, and Argus then entered the harbour and placed themselves close to the batteries of the island, with which they exchanged a pretty brisk fire. At last, about half-past 5, the steamers, carrying 500 soldiers, entered the Channel, placed themselves in the intervals that separated the brigs, and a landing was immediately effected. The island was defended with the courage of despair by 320 Moors and Kabyles, who composed the garrison. A great number were killed, and 140 who had retired into a mosque ultimately surrendered. Our losses on that day amounted to 14 killed, and 64 wounded (including 1 officer killed and 6 wounded). The island once taken, we resolved to destroy the batteries of the town facing the roads, which had been already greatly damaged by our artillery. It was indispensable to render them al ogether unavailable to the enemy. Yesterday, accordingly, 500 men were landed under the protection of the cross fire of three steamers and two brigs; they experienced no resistance. We spiked and threw several guns into the sea, and carried away others; the powder magazines were flooded; finally, we brought off or sank all the boats in the harbour. I think we might have penetrated at the time, without any danger, into the interior of the town; but this would have been a display without any object or any other result than useless pillage. I consequently desisted, and returned with the troops on the island, and ordered the crews on board their respective ships. I am now engaged in establishing a garrison of 500 men in the island. The occupation of the island, without the blockade of the harbour, would be an incomplete measure. I accordingly comply with your orders, by shutting up the harbour of Mogadore. The town is, at the moment I write, on fire, plundered and ravaged by the Kabyles of the interior, who, after driving out the imperial garrison, have taken possession of it. We have just received on board the British Consul, his family, and a few Europeans. I will not close my despatch without mentioning the services rendered by every person under my orders during the present campaign. Everybody served with a zeal inspired by the ardent love of his country, its honour, and interests, and with an absolute devotion to the service of the King. Receive, M. le Ministre, the assurance of my respect.—FRANCOIS D'ORLEANS. P.S.—Amidst the occupations with which I am overwhelmed, I have no time to send you a detailed report. Captain Bouet, who will hand you this despatch, will give you all the information you may desire. I send by him the colours which waved on the city and on the batteries of the island." Private letters add to this account that the Prince was in the thickest of the fight upon the island, and was frequently exposed to a shower of balls which picked off several of his officers. The Moors ultimately capitulated, and the tri-coloured flag was hoisted on every point of the island, which is the real key of the town and harbour of Mogador. The dead bodies of 182 Moors were thrown into the sea, 80 others wounded were conveyed on board the fleet in order to receive surgical assistance, and 130 prisoners were picked up on the island. On the return of the troops and sailors, the Prince made a signal to cease firing. This was on the evening of the 16th. During the night the English Consul, Mr. Willshire, with his wife and friends, whom the British frigate Warspite, anchored near the island, had vainly claimed during five days from the Moorish authorities, was received with several other English in the boats of the Cassard. Mr. Willshire had escaped by stealth, as the Moors would not allow him to embark, because he was indebted to the Government on account of mercantile transactions. The Prince, after having paid them the most polite attention, gave orders to the Rubis to carry them on board the Warspite, which greeted her with her band playing the national airs of France. The captain of the English frigate immediately afterwards returned most grateful thanks to the Prince. On the 17th the Kabyles came down from the mountains, and finding the town occupied neither by the Moors nor the French troops, entered it, and delivered it up to plunder. Several quarters were already on fire, and they kindled conflagrations in other parts. In short, the town, almost entirely abandoned by its population, was soon a heap of ruins. The 20,000 inhabitants who peopled it fled into the interior. In the evening of the 17th the Prince sent off the prisoners to Marshal Bugeaud. Governor Bouet likewise took passage in the same steamer, to notify the blockade of Mogadore at Cadiz and Gibraltar. This officer, who furnished the documents and plans relative to the attack on Mogadore, was charged by the Prince to convey to France the Moorish flags taken in the town and island of Mogadore; and on his arrival in Paris on Monday these trophies were deposited with great ceremony at the Hotel des Invalides.—Marshal Bugeaud's despatch is also dated Aug. 17. It gives in detail the particulars of the Battle of Isly, of which we noticed the leading features in our last. The Marshal states that the Moors fought with determined bravery, disputing every inch of ground, and were only routed by superior military skill; 18 standards were taken, with 11 pieces of artillery, and the parasol of the Emperor's son—the badge of his command. The great exploit of the day appears to have been the charge of the Moorish cavalry, which was sustained by the French infantry with extraordinary firmness. The Marshal says, "It required all the solidity of his infantry, and not a man betrayed any weakness." On the results of the battle he says, "The Moors left on the field of battle at least 800 killed, almost all of them cavalry; of the infantry, which was not numerous, the greater part escaped from us in consequence of the ravines. This army has besides lost all its *materiel*. It must have had from 1500 to 2000 wounded. Our loss was four officers killed and 10 wounded; and 23 sub-officers or soldiers killed, and 86 wounded. The battle of Isly is, in the opinion of the whole army, the consecration of our conquest of Algeria; it cannot fail, besides, in greatly accelerating the conclusion of our differences with the empire of Morocco. From all accounts of the prisoners and the Arabs, who saw the camp of the enemy, their cavalry cannot be calculated at less than 25,000. They showed themselves very bold, but the confusion rendered their efforts powerless. The boldest stood to be killed. All they wanted to do well, was the force of combination and a well-constituted infantry to support their movements. With a Government like theirs it would require several ages to give them the requisites of success in battle."—For some time past the Pa is papers have been most violent and unjust in speaking of the conduct of Mr. Drummond Hay, in respect to the quarrel between France and Morocco. Not only he, but Sir R. Wilson, have been accused of fomenting the quarrel, and preventing the Emperor from acceding to the French demands. These calumnies are now set at rest by a letter published by the *Constitutionnel*, and addressed to M. Blanqui, a member of the Institute. It is dated from the banks of the Isly, August 18, four days after the defeat of the Moorish army by Marshal Bugeaud:—"You know that we have taken the whole of the camp belonging to the Emperor's son. In his tent a small case was found, containing the whole of his correspondence. Several officers immediately examined the contents, and found a letter addressed by the Emperor Muley-Abderrahman to his son, in which he informs him of the mission of the English consul-general, Mr. Hay, the advice which Mr. Hay gave him, and the conditions which were required of him. These conditions were precisely those demanded by the French Government, and our own consul could not have held firmer or more proper language. Without doubt, England, in acting in this manner, showed the interest she takes in seeing our differences with the Emperor of Morocco soon terminated; but in reading these letters, we have to acknowledge that she acted with frankness. The correspondence of Muley-Abderrahman with his son has also proved that Marshal Bugeaud had good reason for calling upon the Prince of Joinville to act with vigour on his side. The most serious alarm is manifest in every paragraph of the Imperial letters, and internal embarrassments betray themselves throughout." It is rumoured that Marshal Bugeaud is to be created a Peer, with the title of "Count d'Isly."—The Ministerial *Globe* states that a letter from Marshal Bugeaud, of the 18th, was received on Thursday, at the War-office, confirming the reports current at Toulon and Marseilles of Abd-el-Kader having been seized by command of the Emperor of Morocco, but the official journals are still silent on the subject, and the fact is questioned by all the other papers. Nevertheless, the statement is reiterated in a letter from Algiers of the 23d, which states that the Emperor, on learning the defeat of his army and the brilliant victory obtained over his son by General Bugeaud, immediately sent 400 of his cavalry to seize Abd-el-Kader; they fell in with the Emir, made him prisoner, and took him to the Emperor, who instantly informed General Bugeaud of it.—The victory obtained at Isly, and the bombardment of Mogadore, will most likely for some time to come be the leading and almost exclusive topics of the journals. The impression made in England by those events is the theme of many a long article, all of which concur in expressing the notion that it has been most powerful, and that the blows dealt by France on the frontier and coast of Morocco have sobered the English press, and converted its language from violence and bravado into moderation and tameness. The cautious *Journal des Débats* itself can scarcely refrain from participating in this exultation, although, in a more conspicuous article, it takes care to affirm, again, in reply to the ambitious declarations of the *National*, that France requires nothing more than a reparation and guarantee for the security of Algeria, and that, notwithstanding the achievements of Marshal Bugeaud and the Prince de Joinville, she has not the slightest intention of aggrandising her territory at the expense of the empire of Abderrahman. It is indeed stated that the Government has, with a view to put an end to the war with Morocco, directed that the original terms offered by them to Muley-Abderrahman shall be repeated, notwithstanding these victories, and have even omitted demanding anything in the shape of indemnity for the expense they have been put to by his resistance. It appears also from a letter written by an Aide-de-Camp of the Prince de Joinville to the Consul of France at Cadiz, that the occupation of the island and the destruction of Mogadore will terminate the campaign for this year, until the effect produced by the event on the Emperor and on the fanaticism of his subjects be ascertained. The letters published in the *Times*, which have created so much excitement in Paris, are still commented upon by the papers, and the *Siècle* goes so far as to say that the English Ministry has expressed the wish to discover and reprimand the officers supposed to have written the letters.—In reference to the spoils of the Moorish war, the *Presse* states that the famous parasol, belonging to the son of the Emperor, which was taken at the battle of Isly, had, through a singular chance, been manufactured in Paris, by a mercer of Rue St. Denis, for a house of Marseilles which has extensive commercial dealings with Morocco. Three years ago that house sent it as a present to the Emperor, it being the custom to make such gifts to the African sovereigns to secure their good graces. It is entirely lined with green velvet, embroidered with arabesques, and edged with a long gold fringe. This beautiful piece of workmanship cost 1800f.—The *Moniteur* publishes a Royal ordinance, issued on the report of Marshal Soult, instituting a committee to proceed forthwith with the revision of the ordinances for the organisation and internal regulation of the Polytechnic School.

SPAIN.—We have accounts from Madrid to the 28th ult. The approaching elections are the only political events spoken of, but as there is no doubt of the result, they have lost much of their interest. Not one member of the Liberal party has ventured to offer himself as a candidate. One or two have, indeed, been brought forward by their friends, but these are persons who have already contrived to escape the vengeance of General Narvaez by taking refuge in a foreign country. It was believed that M. Martinez de la Rosa had accepted Queen Christina's invitation to accept the office of Minister of Foreign Affairs, in the place of the embassy at Paris, and the Paris papers announce that he left Paris for Madrid on Monday. M. Mazarredo, the Captain-General of Madrid, had taken his departure for the waters of the Pyrenees, whence, it was expected, he would forward his resignation of that post to the Government. The discontent lately manifested by the troops of the garrison of Madrid was attributed to the mismanagement and suspicious disposition of that officer, who constantly kept them in alarm, without any motive to justify his fears. These accounts state, that owing to the exertions of Mr. Bulwer, the English Ambassador,

the questions in dispute between Spain and Morocco had been satisfactorily arranged.

BELGIUM.—The British Queen steam-ship, formerly the property of the British and American Steam Navigation Company, which used to run between London and New York, in conjunction with the ill-fated steamship President, now belonging to the Belgian Government, is to be sold without any reserve by public auction at Antwerp, by order of "the Head Commissioner of Lands, Woods, and Forests for the province of Antwerp," with sails, masts, bedding, table linen, earthenware, library, &c.

GERMANY.—By an ordinance of the German Diet, dated August 16, the Germanic Confederation grants to the Sovereign Dukes of Brunswick, Nassau, Saxe-Coburg Gotha, Saxe-Meiningen, Saxe-Altenburg, Anhalt-Dessau, Anhalt-Bernburg, and Anhalt Cœthen, the title of Highness (*hoheit*) for their persons, instead of Serene Highness (*Durchlaucht*), hitherto in use. The term *ducal* is not added to *highness*, in the hope that the sovereign dukes will not assume a title which might be considered other than Ducal Highness. The relations of reciprocal rank amongst sovereign houses are nowise changed by this decree.—The King and Queen of the Netherlands have been travelling in Germany for some days past on a visit to the different Courts.—The Prussian Government, in order to obviate in future accidents on the railroad, have constituted at Berlin a school for the special purpose of giving instruction in the art of conducting the locomotives. The number of pupils is fixed at 400. The annual payment to be made by each pupil is very moderate. The course of instruction is completed in one year.

DENMARK.—A letter from Copenhagen of the 22d ult. states that "the death of the Grand Duchess Alexandra, wife of the presumptive heir of the Crown, has inspired much sympathy, but in a political point of view the impression caused by this event is quite different. The connexion which was formed between Denmark and Russia was not seen with pleasure. The marriage was even less popular in the Duchies. The presence of the Russian fleet has caused considerable irritation here. Serious fears were entertained that the Emperor of Russia coveted both Copenhagen and Constantinople. At Stockholm the entrance of the port had been fortified to prevent surprise."

GREECE.—We have accounts from Athens of the 19th ult. The new Ministry has been appointed in place of Mavrocordato and his colleagues. M. Colletti has been appointed President of the Council and Provisional Director of the King's Palace, and in the meantime he is also to hold the seals of the Foreign-office, of Public Instruction, and Ecclesiastical Affairs. M. Metaxas is appointed Minister of Finance, and interim Minister of the Marine. M. Kitzos Tsavellas is appointed Minister of War, and M. Zaphiros Balbos Minister of Justice. The last named minister was educated at Geneva, and is said to be a person of great understanding and enlightened mind. On the day after their appointment the Ministers issued a proclamation, which declares that they are enemies to all exclusive privileges, and that they will always act upon the principles of even-handed justice to all. Before the nomination of the new Ministry there was a great agitation in Athens, and some slight outbreaks took place, but the King's presence helped greatly in restoring order. His Majesty appeared among the people and addressed them, calling upon them to assist him in maintaining the peace of the country. The elections in the capital had taken place without any further disturbance, and at the time the mail left Athens the capital was quiet.

RUSSIA.—The *Augsburg Gazette* of the 29th ult. publishes a letter from Tauris, in Persia, of the 18th of July, announcing further successes obtained by Schamyl over the Russians in the Caucasus. Chunsak and Tewrandschura, both important Russian fortresses, had fallen into the power of the Circassians. The fall of Chunsak was occasioned by a *sortie* made by the garrison, which was in want of provisions, and in the confusion Schamyl entered with a superior force and put the garrison to the sword. Schamyl has subsequently abandoned these fortresses, after having destroyed the works. The mountaineers of Cachetie have since that period revolted, and, excited by their fanatic mollahs, they have advanced against the Russians during the absence of General Neidhart in Daghestan. The town of Cheki has been surprised by a Circassian chieftain called the Sultan Daniel; the garrison was massacred and the town pillaged. There is a complete consternation in the capital of Georgia, and the road to Erivan is no longer safe for travellers.

TURKEY.—Accounts from Constantinople of the 14th ult., in the *Augsburg Gazette*, state that a new insurrection had broken out in Albania, but that it was instantly suppressed. It is added that the French ambassador in Persia had obtained at Mossul the liberation of the Patriarch of the Nestorians, and intended to proceed to Teheran, with a view to obtain protection in Persia for the Catholic missionaries who had been expelled from that country. A Belgrade letter of the 14th ult. informs us that serious disturbances had taken place at Belina, in Bosnia. The Christians there having built a church, the Turks pulled it down, and committed other excesses. They also attempted to murder the Bishop who had consecrated the church, but he was fortunately able to effect his escape. Wuschtusch and Petronevitch have been allowed to return to Servia. The commissioner sent into Albania, to inquire into the grievances complained of by the people of that province, has returned to Constantinople.

TRIPOLI.—Advices from Tripoli, of the 12th ult., state that an insurrection had broken out in the Gerian mountains, and that Miludi Sheik, the Ex-Minister of the deposed Mahmudi family, had placed himself at its head. A body of Turkish cavalry, marched against them, had been repulsed, with the loss of their colonel, Ismail Bey, who was either killed or taken prisoner. The son of the Pasha was preparing to embark for Bengazy, to assume the command of the expeditionary army. It was rumoured that some Frenchmen were directing the movements of the insurgent mountaineers, but for this report there seemed little foundation.

Parliament.

HOUSE OF LORDS.

Thursday.—This being the day appointed for the re-assembling and prorogation of Parliament, both Houses met. Nothing was transacted in the House of Lords, beyond giving judgment in several appeal cases, and the usual ceremonial of prorogation by Commission.—The Lords Commissioners were the Lord Chancellor, Lord Wharncliffe, Duke of Buccleuch, Duke of Wellington, Earl of Dalhousie, and Earl Delawarr.—Earl DELAWARR delivered Her Majesty's answer to the congratulatory address of their Lordships on the birth of a Prince, which was laid upon the table.—Viscount CANNING laid on the table a copy of the treaty of commerce and navigation between Her Majesty and the Grand Duke of Mecklenburgh Schwerin.—The LORD CHANCELLOR then directed the Usher of the Black Rod to summon the House of Commons to attend.—The Speaker, with several Members of the House of Commons having appeared at the bar, the LORD CHANCELLOR said: "My Lords, and Gentlemen of the House of Commons—Her Majesty not thinking fit to be personally present here at this time, has been pleased to cause a Commission to be issued under the Great Seal for the purpose of giving her Royal assent to several Acts agreed upon by both Houses of Parliament." The Commission was then read, directed to the Lords above named, the Duke of Cambridge and the Archbishop of Canterbury being joined in the Commission. The Royal assent was then given, with the usual form, to the following Bills:—A Bill for the better Regulation of Joint-stock Companies; a Bill for facilitating the Winding-up of the Affairs of Joint-stock Companies; a Bill for the Regulation of Joint-stock Banks; a Bill to indemnify persons connected with Art Unions from certain pecuniary Penalties; a Bill to amend and consolidate Acts relating to Merchant Seamen, and for keeping a Registry; a Bill to regulate the Expenses of Officers in the Courts of Law in Ireland; and a Bill to amend the Acts relating to Irish Fisheries.

The LORD CHANCELLOR then read the following speech:—

"My LORDS and GENTLEMEN—We are commanded by Her Majesty, in relieving you from further attendance in Parliament, to express to you the warm acknowledgments of Her Majesty for the zeal and assiduity with which you have applied yourselves to the discharge of your public duties during a laborious and protracted session. The result has been the completion of many legislative measures calculated to improve the administration of the law, and to promote the public welfare.

"Her Majesty has given her cordial assent to the Bill which you presented to Her Majesty for regulating the issue of bank notes, and for conferring certain privileges upon the Bank of England for a limited period.

"Her Majesty trusts that these measures will tend to place the pecuniary transactions of the country upon a sounder basis, without imposing any inconvenient restrictions on commercial credit or enterprise.

"We are directed to inform you that Her Majesty continues to receive from her Allies, and from all Foreign Powers, assurances of their friendly disposition.

"Her Majesty has recently been engaged in discussions with the Government of the King of the French on events calculated to interrupt the good understanding and friendly relations between this country and France.

"You will rejoice to learn that by the spirit of justice and moderation which has animated the two Governments this danger is happily averted.

"GENTLEMEN OF THE HOUSE OF COMMONS—We are commanded by Her Majesty to thank you for the readiness with which you have voted the supplies for the service of the year.

"Her Majesty has observed, with the utmost satisfaction, that by the course to which you have steadily adhered in maintaining inviolate the public faith, and inspiring a just confidence in the stability of the national resources, you have been enabled to make a considerable reduction in the annual charge on account of the interest of the national debt.

"MY LORDS AND GENTLEMEN—Her Majesty desires us to congratulate you on the improvement which has taken place in the condition of our manufactures and commerce, and on the prospect that, through the bounty of Divine Providence, we shall enjoy the blessing of an abundant harvest.

"Her Majesty rejoices in the belief that, on your return to your several districts, you will find generally prevailing throughout the country a spirit of loyalty and cheerful obedience to the law.

"Her Majesty is confident that these dispositions, so important to the peaceful development of our resources and to our national strength, will be confirmed and encouraged by your presence and example.

"We are commanded by Her Majesty to assure you that when you shall be called upon to resume the discharge of your parliamentary functions, you may place entire reliance on the cordial co-operation of Her Majesty in your endeavours to improve the social condition, and to promote the happiness and contentment of her people."

The Commission for the prorogation of Parliament to Thursday, the 10th October, was read by the clerk.—The LORD CHANCELLOR then said: "My Lords and Gentlemen—By virtue of Her Majesty's Commission under the Great Seal, to us and other Lords directed, and now read, we do, in Her Majesty's name, prorogue this Parliament to Thursday, the 10th day of October next, to be then here holden. And this Parliament is accordingly prorogued to Thursday, the 10th day of October next."—Their Lordships then dispersed. Only one or two Peers were present, besides the Commissioners and Law Lords.

HOUSE OF COMMONS.

Thursday.—Mr. BENBOW, the new Member for Dudley, took the oaths and his seat.—Mr. HOPE moved for a new writ for North Lancashire, in the room of Lord Stanley, who has accepted the Stewardship of the Chiltern Hundreds.—Sir C. NAPIER called attention to the subjects of Tahiti and of Morocco, and of the present condition of our naval force, in comparison with that of France.—Sir R. PEEL: "I think I shall best perform my duty to the House and to the public by making as brief an answer as possible to the questions put by the gallant officer. I must state that Her Majesty's Government have no reason to doubt that the assurances they have received relative to the proceedings taken by the French in Morocco and on the African coast will be strictly fulfilled. As to the other events to which the gallant officer has referred, I have to state that discussions have taken place between this Government and the Government of the King of the French, with regard to events the occurrence of which was calculated to disturb the friendly relations between the two countries. I have the satisfaction of stating that those discussions have been brought to an amicable and satisfactory termination. (Loud cheers from both sides of the House.) The communications that have passed between the two Governments will, of course, at a future period, be laid before this House and the country, and I trust I shall not be pressed at the present time for any farther statement on that subject."—Mr. HINDLEY wished to know the opinion entertained by the right hon. Baronet relative to the conduct of Mr. Pritchard. That gentleman, now in this country, had had his conduct maligned; he was charged with having acted imprudently, and it would be but fair that the right hon. Baronet should state his impression as to the course he had pursued.—Sir R PEEL: "I have already stated that the discussions which have been for some time past pending have been brought to an amicable and a satisfactory termination—satisfactory to both countries; and I do hope that I shall not be pressed to make any farther statement at the present moment. When I say 'satisfactory termination,' of course I mean one perfectly consistent both with the interests and honour of this country."—Mr. T. DUNCOMBE, adverting to the new writ issued in the room of Lord Stanley, asked if that noble Lord was still at the head of the Colonial Office?—Sir R. PEEL replied that his noble friend was still at the head of Colonial affairs, and that the change would make no alteration whatever as to his position in the Cabinet.—Mr. T. DUNCOMBE, adverting to the laughter with which Sir R. Peel's statement had been received, remarked that he had no interest in the subject, but the public would naturally be anxious to know if the noble Lord, occupying a high position in her Majesty's Councils, had retired or been removed. He then adverted in strong terms to the subject of the State Trials, censuring the Government for having, through several of its members, termed Mr. O'Connell and others "baffled and convicted conspirators," when, by the decision of the House of Lords, they were declared to have been unjustly imprisoned for three months. The proceedings were disgraceful and contemptible, and betrayed a vindictive feeling on the part of the Government. What did they now mean to do in order to conciliate Ireland, as reparation and atonement for proceedings by which the Government had given an immense impetus to the Repeal question? He moved that a message be sent to the Lords for a copy of the opinions of the Judges and of the judgment.—Mr. OTWAY CAVE seconded the motion, dwelling on the mistaken policy pursued by the Government towards Ireland.—Sir R. PEEL declined to enter on a discussion on this question, at a time when they were momentarily expecting a summons by the Black Rod to attend the other House. At the proper time he would undertake to defend the Government, which, at a time of great difficulty in Ireland, had endeavoured to maintain tranquility, not by recourse to extraordinary powers, but by the ordinary process of the law. He assented to the motion, though it was too late to send up a message to the Lords, but he would take care that it was attended to at the commencement of next session.—Lord J. RUSSELL agreed that the time was inconvenient for a discussion of the subject, but when the proper time arrived, he would support his reiterated opinion, strengthened as it was by the result, that Mr. O'Connell and his fellow-traversers had not received the benefit of a fair trial by jury, but that the trial had taken place by a jury elaborately constructed for the purpose of conviction. He insisted that the people of Ireland should have the same substantial justice as those of England.—Sir T. WILDE then rose, and was entering into the legal and constitutional view of the question, when he was interrupted by Sir A. Clifford, who summoned the House to attend the House of Lords. The Speaker and Members accordingly proceeded thither, the Queen's Speech was read, and after all the formalities had been gone through, Parliament was prorogued, according to usage, for a short period, the time named being the 10th October. After the Speaker had returned to the House of Commons, he read a copy of the Speech at the table, all the Members standing round; when that was done, he shook hands with Sir R. Peel, Lord J. Russell, and others, and the House was immediately deserted.

CITY.

Money Market, Friday.—Consols closed at 99¾ for Money and the Account; India Stock has risen to 283; Exchequer Bills, 74 to 76 prem.

—GAZETTE OF THE WEEK—BANKRUPTS—J. BROWNE, 5, King's Cross, saddler—W. C. CLOUGH, Eye, Suffolk, apothecary—C. J BANISTER, Derby, linendraper—J. and J. WOODHEAD, Bradford, worsted stuff manufacturers—H. HALL, Northumberland, cattle dealer—R K. MANN, Kingston-upon-Hull, wine merchant—J. OLD, White Roothing, Essex, dealer in cattle—T. and J. BAILEY, Kingscliffe, Northampton, toy dealers—T. ROLLINGS, Ingram-court, Fenchurch-street, wine merchant—L. SOPHIAS and W. PERRITT, Gravesend, Kent, grocers—R T. DOCKERAY, Dartford, Kent, market gardener—C. R. TERRELL, Carey-street, Chancery-lane, victualler—R. PETTIGREW, jun., Woolwich, tailor—H. CLARKE, Sheffield, builder—J. KITCHEN, Cheshire, corn-dealer—L. A. REGNAULT, Cheltenham, milliner.

SCOTCH SEQUESTRATION.—T. STEVENSON, Edinburgh, general agent.

BANKRUPTCY ANNULLED—J. BATTEN, Tilehurst, Berkshire, cattle-dealer—J. C. KNILL, Gloucester, tailor.

Metropolis and its Vicinity.

The House of Commons.—Last week the Speaker's house, with several other apartments connected with the House of Commons, adjoining St. Stephen's cloister, were sold by auction, in order to be taken down for the formation of the entrance to the centre hall of the new palace. The sale took place in the smoking-room, and there was a numerous attendance of purchasers of building materials. Besides the Speaker's house (which was but slightly injured at the conflagration of the Houses of Parliament), there were the two refreshment-rooms, the kitchens, and the smoking and coffee-rooms, which had been built since the fire for the convenience of members. The whole were divided into 46 lots, and one of the conditions of the purchase was that the entire building should be removed within 18 days. Some parts of the premises were erected in the Gothic style, and the floorings of some of the rooms were laid with oak, and in good condition. The several lots went for about 437*l.* The brickwork was put up at 26*l.*, and fetched 149*l.*

Election of Chamberlain.—The election of Chamberlain in the room of the late Sir W. Heygate commenced on Thursday. Alderman Humphery, Sir J. Key, and Mr. D. W. Harvey having retired, there were only two candidates—Alderman Brown and Mr. Heppell. At the close of the day's poll the numbers were, for Alderman Brown, 464; for Mr. Heppell, 11. The polling was resumed yesterday morning at 9 o'clock; and at 3, when the poll closed for the day, the gross numbers were: Mr. Alderman Brown, 1670; Mr. Heppell, 49.

New Convent in London.—For the first time since the Reformation, the order of the Sisters of Charity has been established in the metropolis. Eight nuns and one novice from the nunnery in Bagot-street, Dublin, have just arrived here, under the patronage of the Right Rev. Dr. Griffiths, Roman Catholic Bishop of London, and the Roman Catholic nobility. They have temporarily taken up their residence at 32, Queen-square.

The Exhibition of Fine Arts.—On Saturday, the exhibition at Westminster-hall, of the cartoons, fresco painting and sculpture, finally closed, having been on

view two months. During that period, from the 1st to the 15th July, visitors were admitted by the payment of a shilling each person, and for the last six weeks, with the exception of the Saturdays, the exhibition was free, and many thousands were present each day.

Metropolitan Improvements.—Between Holborn and Oxford-street the line of the new street is in a state of considerable forwardness. The vaults for the houses on either side of the way are completed, and the width of the thoroughfare is now marked out; through the whole distance a sewer about 15 feet below the surface is being formed, and is nearly half completed. When the whole length is finished there will be a direct communication between Holborn and Oxford-street for foot passengers. Many now take this course, avoiding the circuitous way by St. Giles's Church. While digging the ground for the vault on the site of the Rookery the workmen met with some curious remains. Outside the walls, where stood the hospital for lepers, was found the root of a vine, which is said to have been celebrated for its fruit, and was in good condition. Several pieces of marble slabs were also taken out of the ruins of the hospital, and a marble slab with the following inscription on it:—"Buckeridge-street, 1688." This street was built shortly after the fire of London, and out of some of the materials, which were publicly sold after that calamity. A quantity of wood excavated here (some of which is oak) was discovered in a charred state.

Excise Seizures.—On Saturday a seizure was made by the Excise on the premises of Mr. Ryder, tobacco-manufacturer, of Chiswell-street, Finsbury. From information received, two officers proceeded to the premises, and requested to examine the stock of tobacco, which was readily acceded to, and the result was, that they discovered a large quantity of manufactured tobacco, which appeared to be adulterated with an article resembling peat. They accordingly seized the whole, and, pursuing their search, found a large pan, containing a solution of honey, or some other saccharine matter. They then proceeded to an adjoining room, which they minutely examined. It contained a cupboard, which they found locked, and on requesting the key of it, they were told that the key had been lost for a considerable time, and therefore could not be produced. The officers, not satisfied with this answer, determined that the cupboard should be examined, and an iron bar being procured, it was forced open, and within was found about 70lb, of peat, or a similar article. Upon the officers inquiring its use, they were informed that it had been there for some years, when the law allowed tobacco-manufacturers to have such articles in their possession. In the course of their search they also found a vessel containing Venetian red and a mixture of other ingredients, but during the time the officers were engaged in the inner apartment, the pan of saccharine matter had entirely disappeared, and was nowhere to be found. The whole stock was deposited in a van, and conveyed to the Excise-office, to be adjudicated upon by the Commissioners. Another seizure was made on the same premises about three months since.

Medical Reform.—On Tuesday evening a numerous meeting of the members of the College of Surgeons was held at Exeter-hall for the purpose of adopting measures regarding the conduct of the Council of the College in refusing to grant an interview to the members, respecting a reform in the profession. The chair was taken by Mr. Asbury, of Enfield, supported by Mr. Wakley, M.P., and other gentlemen. The chairman addressed the meeting at some length, and denounced the conduct of the Council in refusing to receive the address, commenting strongly on the nature of the charter recently granted to the Council. The meeting was addressed by several gentlemen, who proposed resolutions in accordance with the objects of the meeting. Among these was one to the effect that the experience of many years of the conduct of the existing governing medical bodies has convinced the members of the medical profession that their grievances will be unredressed, and their wants and wishes disregarded, until they should have it in their power to elect a governing head that should be responsible to the members at large.

Captain Warner's Inventions.—On Saturday the correspondence which has taken place between Captain Warner and the Government respecting his inventions, was printed by order of the House of Commons. The first letter was dated the 5th October, 1841, and the last on the 9th November, 1843. It appears that Captain Warner in 1841 complained that he had suffered 10 years' delay, suspense, and disappointment, demanded 200,000*l.* for his invisible shell, and 200,000*l.* for his "long range," and in graphic terms speaks of their destructive powers on sea and land; at the same time he states that the disappointments he has endured have involved him in pecuniary embarrassments, alluding to the commands of the late king, that he should not leave the country, and the expectations he had formed that his inventions would have been accepted. In the first letter from Sir R. Peel to Sir G. Murray, the right hon. Baronet requests that great caution should be used in the negotiations, and declares the sum to be "exorbitant, at least large in amount," and refers to a letter shown him by Lord Ingestre, that 300,000*l.* would be no obstacle from a foreign Power to secure the inventions. It would seem that in October last it was arranged that the "long range" invention should be tested. Captain Warner offered to procure 1500*l.*, and the Government consented to pay 500*l.* The former was however unable to raise his portion, and the negotiations were abruptly closed at the end of the month. The public are aware of the recent experiment, and the discussion which has occurred in the House of Commons, which discussion is likely to be continued in consequence of the information which is now afforded by the publication of the correspondence, which contains a great many letters, and extends to 70 printed pages.

Caledonian Asylum.—At a Quarterly Court of this Asylum held on Thursday, at Freemason's Tavern, the resolution agreed to at a former meeting that the appointment of master should be confined exclusively to members of the Church of Scotland was affirmed, being the second time that the Free Seceders have been defeated on this question.—We may here mention that Vice-Chancellor Wigram has just pronounced an important decision in reference to Scotch churches in England, viz., that their connection with the English Presbyterian Synod does not, as the seceders have pretended, enable Free Secession ministers to hold these places of worship.

Hungerford Suspension Bridge.—A general meeting of the shareholders of this bridge took place last week. The Report stated that the whole of the iron work necessary for the completion of the bridge for foot passengers had been supplied, the tower chains crossed, and the whole work was progressing rapidly towards completion. The receipts amounted to 89,067*l.* 19*s.* 9*d.*; disbursements to 86,956*l.* 16*s.* 7*d.*; leaving a balance of 2111*l.* 3*s.* 2*d.* After the Report had been adopted, the chairman broached a project to induce the intended Richmond and West Junction railway, which is to run from Richmond to the Surrey side of the Hungerford Suspension-bridge, to use the bridge, and run the carriages over into Hungerford-market. For this purpose the bridge is to be enlarged; and the chairman explained that many advantages would be gained by coming to a resolution of that kind before the wooden work for the bridge was prepared according to the old plan. After some discussion, the Directors were authorised, should they deem it expedient to adopt the project, to widen the bridge sufficiently for the transfer of railway carriages.

Juvenile Fête at Lord's Ground.—A juvenile *fête* was given on Friday at Lord's Cricket-ground, St. John's-wood, by the conductors of the Ioway Indian entertainment, when the miniature equipage of "General Tom Thumb," with the pigmy ponies and the dwarf coachman and footman, was for the first time submitted for public inspection. The carriage is perhaps the most extraordinary thing of the kind ever witnessed, being in fact a complete model of a fashionable chariot of modern time, but with the attendants in the livery of the past century—cocked hats, powdered wigs, and bouquets in their button-holes. The servants are about three feet in height, and the coachman when mounted on his box does not appear much to exceed "the General" in stature. The height of the carriage is three feet six inches from the ground, and the length six feet. The colour is ultramarine blue, picked out with crimson, the lining drab silk. The crimson hammercloth is decorated with silver hangings, silk lace, and fringe, and ornamented with a star, with the General's armorial bearings in frosted silver. The coat of arms is Britannia and Liberty supported by the British Lion and American Eagle, surmounted by a rising sun, and the British and American flags crossed, and the Yankee motto of "Go ahead." The harness is made of black leather, ornamented with chased silver beading, with the General's coat of arms, blue and silver pad-cloths, and blue and white rosettes. The ponies 34 inches high, were purchased from the stud of Mr. Batty, at Astley's Amphitheatre. The carriage combined with the dances, archery, and ball-play of the Indians afforded infinite amusement to the juvenile branches of the nobility, who thronged the grounds, and were the theme of general admiration. The *fête* by desire was repeated on Saturday, when the Ioways struck their wigwams.

The Ioway Indians at Ealing Park.—At the invitation of Mrs. Lawrence, the 14 Ioway Indians, attended by Mr. Catlin, Mr. Melody, and the interpreter, visited Ealing Park on Wednesday, for the purpose of entertaining several members of the Royal Family; among whom were present their Royal Highnesses the Duchess of Gloucester, the Duke and Duchess of Cambridge, the Grand Duke and Duchess of Mecklenburgh, and Princess Mary of Cambridge; there were also present the Duchess of Northumberland and Miss Percy, Lord and Lady Prudhoe, and several other distinguished personages. The Ioway Indians were reclining on the beautiful lawn in front of the house when the company arrived. They immediately arose and greeted the Royal party, after which they gave the war dance, the eagle dance, and scalp dance, and then commenced the ball-play, which appeared to afford much gratification to the spectators. A dinner was afterwards prepared upon the lawn for the Indians, of which they all partook. It consisted of roast beef and plum pudding, with water and cider. When they had finished, and while the Royal party were partaking of refreshments, the Indians walked over the grounds and visited the summer-houses and conservatories. They completed their amusements by giving the farewell dance. Neu-mon-ya (Walking Rain), in a very appropriate manner, then addressed Mrs. Lawrence, thanking her for the polite invitation to meet the Royal party, and her kindness towards the Indians; after which he addressed the Duke of Cambridge in the following manner, as interpreted by their favourite interpreter, Jeffrey Dorame:—Neu-mon-ya said he was glad the Great Spirit had allowed him the honour of shaking the Royal Duke's hand, as he had heard that he was related to his Great Mother the Queen. By shaking the hand of so great a Chief, he considered that he had shaken hands with all the people of England. Whilst crossing the ocean, he had thrown into the water much tobacco, hoping to see his great mother's face, which they all wished to look at before they went back to their wigwams. His Royal Highness shook hands with the chiefs at the conclusion of this speech, after which the Indians left the grounds, highly delighted with their visit to Ealing-park.

Death of Mr. Baily.—We regret to announce the death of Mr. Francis Baily, President of the Royal Astronomical Society, who expired on Friday last, at his residence in Tavistock-place, Russell-square, in the 71st year of his age. His scientific attainments were of the highest order. He was a Doctor of Civil Law, Member of the Royal Irish Academy, a Fellow of the Linnean and Geological Societies, and a Fellow of the Royal Society, having been elected into that body in 1821. He was correspondent for several learned and scientific societies abroad, amongst others the Institute of France, and the Academies of Naples, Palermo, Boston, and Berlin. His death will be regretted by a large circle of friends and acquaintances, by whom he was deservedly esteemed.

Metropolitan Police Returns.—A return has been made during the present session of Parliament, which is, in a statistical point of view, illustrative to a certain extent of the moral condition of the metropolis. The returns moved for by Mr. Hume were "of the number of persons taken into custody for drunkenness and for disorderly conduct, by the metropolitan police, in each year from 1831 to 1843, both inclusive, distinguishing each, and stating the population of the metropolitan police district in the years 1831 and 1843; and a similar return for the city of London." From this document we glean the following singular results:—The maximum amount of persons taken into custody exclusively for drunkenness is to be found in the years 1831, 1832, and 1833, and the minimum in 1843:—In 1831 they were, males and females, 31,353; 1832 ditto, 32,636; 1833, ditto, 29,880. Taking the population, according to the census of 1831 at 1,515,585, then the number of persons taken into custody for drunkenness was in these periods respectively as about 2 1-15th, 2 1-17th, and 1¾ and a fraction out of every 100. In 1843, the number of persons taken into custody for drunkenness fell to 10,890, which, taking the census of 1841, say 2,068,107 was in the proportion of little more than ½ in every 100. In the city also the same gratifying result is shown. In 1840 the numbers were 5113, which, on the estimated population of 124,876, was in the enormous proportion of full 4 1-10th out of every 100. In 1843 the numbers were 2595, which, taking the official estimated population at 125,273, was in the ratio of 2¼ to every 100. It is hoped from these facts that temperance is becoming more general among the labouring classes of London.

Metropolitan Buildings.—The Act for the regulation of metropolitan buildings came into operation on Monday, the 2d inst. Mr. Hosking, the Professor of Architecture at King's College, and Mr. Higgins, of Furnival's Inn, have been appointed by Sir J. Graham to be the official referees; and Mr. Arthur Symonds, barrister-at-law, who prepared the bill under the direction of the Earl of Lincoln, has been appointed by his lordship registrar.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending August 31; West Districts, 129; Northern, 158; Central, 132; Eastern, 174; Southern, 205; Total, 798. Weekly average for the last five years, 946.

Provincial News.

Birmingham.—A society has been recently established in this town by the working-classes, which its founders have denominated the "Athenic Institution." The object of this Institution is to educate labourers during their hours of leisure, and at the same time to revive a taste for the manly pastimes which were formerly cultivated universally throughout England. The founders of the Institution, finding that the number of members has rapidly increased, resolved recently to make a public demonstration of their strength. They accordingly gave a public dinner last week. Lord John Manners presided as chairman, having previously accepted the office of patron to the Institution. His Lordship in the course of his speech, acknowledging the compliment paid him by the Institution, dwelt at great length on the fine qualities of the labourers and operatives of England, and on the necessity of a more intimate union between all classes of society. He said: "But there was another and still more important object connected with their Institution, namely, that of uniting together again the different classes of society. It was his firm conviction, founded upon a careful examination of history, that in days long gone by, when the unhappy separation of the classes which now existed in this country was not known in the land, there was by far more peace, more real happiness, and more complete security for all classes, than had or could ever exist under such a class-system as now prevailed in society. Their usages were hostile to anything like a cordial amalgamation. How often were they enabled to come together in amity and affection, as they had done that evening? How often had they seen the three classes meet at the one table—partake of the same enjoyment; and yet, as they had often heard, in the days of feudalism, the barons of England were accustomed to sit at the same table, and partake of the same fare with those beneath them. He knew very well that it was deemed unphilosophical to revert to those days and times, and the ancient customs of their forefathers; but, believing as he did, that in those ancient days the peer lost nothing by his condescension, and that the poor were great gainers by it, he saw no reason why

they should not dwell with pleasure on those days, and why he should not, if he could, encourage and support any legal, just, and prudent associations which would have the effect of restoring at least some portion of that fine feeling which existed amongst the people in bygone days, which would elevate the character of those who ought to be considered the pride and glory of their country. That some effort was necessary to produce a change for the better no man could doubt. No one could cast his eye around the surface of English society and not be convinced, that unless something amounting to a cordial union took place between the various classes of society, the state and condition to which they would all be very soon reduced must be unsafe and dangerous. He saw no evils that could arise from such a union; but he saw many that would arise if such a feeling as he had described were not created." In the course of the evening the meeting was addressed by Sir J. Hanmer, Mr. Monckton Milnes, and other gentlemen.

Bradford.—One of the woolsorters' societies in this town have taken a lease of a small farm in the neighbourhood, which they intend to convert into a spot for their own amusement and interest, if possible. It consists of eight acres, which are divided at present into four fields, in one of which there is an excellent spring of water, which the woolsorters intend to convey into a swimming-bath, to be constructed in one of the fields. Part of the land at least is of excellent quality, and the whole of it might soon be brought into good condition. The woolsorters intend to cultivate it as a society, not as individuals; and in this respect the speculation differs from the principle of the small allotment system. The idea of renting the land was suggested during the late depression of trade in the town, and the land was intended as a field on which the society might employ its members when out of regular work.

Castle Hedingham.—On Tuesday week, at Castle Hedingham Petty Sessions, Mr. Thomas Chinery, a respectable farmer, of Belchamp St. Paul, was brought up in custody, charged with setting fire to the farm buildings in his occupation at Walter Belchamp, on the evening of the 3d July last. Mr. Raymond, the chairman of the magistrates, left the bench to give evidence. He said that the prisoner was in the occupation of a farm called New Barns, witness's property. On Wednesday, the 3d July, about half-past 9 o'clock, P.M., he was alarmed by a person named William Stammers coming to his house, stating that Chinery's barn was on fire. When he got outside of the house he saw the sparks from the fire flying towards his own farm-buildings at home. He set some persons to protect them, and, calling his son, went immediately to the fire, which was about a quarter of a mile off; when he arrived the premises were nearly all burnt down; they consisted of a barn and other buildings. The witness then mentioned a misunderstanding about the payment of rent, which induced him to suspect the prisoner. Two labourers deposed that they had seen the prisoner at the fire; and one of them said that the prisoner looked like a guilty man. On the other hand, witnesses were called who swore that they had seen the prisoner on his way towards the fire. The prisoner was discharged. The case excited the greatest interest in the neighbourhood, and the inquiry lasted upwards of four hours, during which the room was crowded, principally by farmers of the neighbourhood, amongst whom the greatest sympathy seemed to exist on behalf of the prisoner, who had been confined in the police station. On the acquittal of the prisoner, great applause was manifested, but immediately checked.

Liverpool.—The local papers have given long accounts of the circumstances under which the wife of a private of the 53d Regiment was separated from her husband and left behind in Liverpool, after the sailing of the detachment for India in the ship Nith. She had been in Ireland and was unable to reach Liverpool in time to report herself, in which case there was no doubt that she would have been allowed to accompany her husband. She arrived, however, just as the troops were in the act of embarking, and a painful scene occurred, which induced some persons to interest themselves with the Colonel of the regiment, and obtain permission for her to follow in another vessel, and rejoin her husband in Calcutta. This request was granted, but she was again doomed to disappointment; for on going on board the vessel the surgeon examined the child, and declared that it was labouring under small-pox, and that it was impossible she could proceed. Upon being sent to the North Dispensary the house-surgeon, with three other medical gentlemen examined the child, declared that the eruption on the skin was merely the result of teething, and signed a certificate to this effect. She was then taken on board the vessel a second time; but the surgeon adhered to his original opinion, and the vessel sailed. A subscription has since been raised for the poor woman's relief, and she will be taken out in the first ship which leaves Liverpool for Calcutta.

Manchester.—On Monday week, a preliminary meeting of the various literary and scientific societies of this town was held, "for the purpose of considering what steps should be taken for the erection of a monument to the memory of the late Dr. Dalton." The meeting came to a resolution, "That, in order that the steps necessary to be taken may be adopted without delay, and to give to the public generally the opportunity of joining in this additional mark of respect to the memory of Dr. Dalton, it is desirable that a requisition should be presented to the mayor, to convene a public meeting to determine what steps shall be taken to secure the erection of such monument; and also to consider as to the propriety of testifying in any further, and in what manner, the sense entertained by this community of the invaluable services rendered to science by the late illustrious philosopher."

Norwich.—The Rev. Mr. Bluck, rector of Walsoken, in this county, has been condemned by the Consistory Court, at Norwich, to forfeit one-third part of the annual value of his benefice, and costs, by reason of non-residence, without leave, for three months.

Nottingham.—The new Roman Catholic cathedral in this city, dedicated to St. Barnabas, was publicly consecrated on Tuesday. The church is the largest yet completed in this country since the Reformation. The building is of the early English style, and is, professedly, a perfect return to the ancient arrangements of a Christian temple. There are no galleries. The windows consist entirely of stained glass, which imparts a great degree of richness and solemnity to the whole interior. In the centre light of the west windows are painted the arms of the Earl of Shrewsbury (a contributor of 10,000*l.* to the building); and in the windows of the aisles are the armorial bearings of Drs. Walsh and Wiseman, the Roman Catholic bishops of the midland district. The eight principal lights bear the following quaint inscription:—"Good Christian people, of your charity pray for the good estate of John Earl of Shrewsbury, the chief benefactor of the building of this church, dedicated in honour of St. Barnabas." The high altar is very splendid, and consists of a single slab of stone, supported by eight shafts of Petworth marble. On the south side of the choir is the chapel of the "Blessed Sacrament," which is the most splendid part of the building, the adornment being very profuse. There is another chapel in the crypt, under the choir, in honour of St. Peter, as the foundation or rock of the church; this will be used in masses for the dead. The pavement of the choir and chapels is composed of encaustic tiles of various devices and colours.

Newcastle-upon-Tyne.—The new Roman Catholic Cathedral of St. Mary, in this town, from the designs of Mr. Pugin, was opened last week, with great ceremony and magnificence. In the morning were assembled 70 priests, with nine bishops, including Dr. Riddell, of Newcastle, and Dr. Briggs, of York. Dr. Riddell celebrated high mass at the altar, and the Right Rev. Dr. Gillis, bishop of the Edinburgh district, preached the sermon. In the afternoon a large body of the clergy and laity partook of luncheon at the Assembly-rooms. Dr. Riddell presided, with the Right Rev. Dr. Brown, of the Lancashire district, as vice chairman. Vespers were chanted in the evening, and a sermon preached by the Right Rev. Dr. Morris. Dr. Newsham, President of Ushaw College, presided at the organ. The congregations both in the morning and evening were numerous and respectable, including several families of distinction from the neighbouring counties, some local magistrates and members of the corporation. The amount of the collections was 150*l.* This new cathedral is of stone, in the pure decorative style. The interior is extremely elegant. The first objects to be noticed are the superb stained windows, the production of Mr. Wailes, of Newcastle. The largest and most striking of these is the gift of the Dunn family, the Right Rev. Dr. Riddell gave another; Mr. G. Caley, of Saltwell-house, a third; others are memorials of the Rev. Messrs. Worswick and Eyre, deceased; Mr. Wailes contributed a sixth, and Miss Helen Culey a small one, which is placed in the south side chapel. They are illustrative of various scenes and sacred persons connected with scripture history. The altar is of stone, brought from Caen, in France, and is divided into three compartments, in which are represented the annunciation, the coronation, and the adoration of the wise men. The back of the altar is similarly divided, with canopies, and exhibits the resurrection, the crucifixion, and the descent of the Holy Ghost; and on either side of the altar are large figures of St. Paul and St. Peter. The pulpit and font are both of Caen stone, and exhibit some fine and tasteful ornament. The corbels are busts of angels, each playing a different musical instrument, and give to the upper part of the building a very pleasing effect. The side chapels and chancel are laid with encaustic tiles. Two other altars are intended to be erected, besides which the plan includes a screen, and various other things yet to be completed.

Portsmouth.—The *Hampshire Telegraph* states that the Victoria and Albert, Royal steam-yacht, in her recent cruise has evinced very superior powers of speed, usually going through the water at the rate of thirteen knots, and sometimes nearly fourteen. She, however, steers badly, and on one occasion, as an experiment, her helm was lashed amidships, and at full speed she made a complete circle in eleven minutes; her helm was then put hard a-port or starboard, and she went round in four minutes and a-half. It is said that this propensity to steer herself arises from her not being on an even keel, and that if her crew with any weights had been marched over to the upper or light side, she would, with her helm lashed amidships, have gone round in the opposite direction. The smell of the bilge-water, which the ventilators of Dr. Reid permitted every part of the ship to be pervaded with last year, has been entirely removed by the use of Sir W. Burnett's patent solution, which neutralises the effluvia as rapidly as it is generated. The yacht is now supplied with coals, and re-painted, and in every respect fit for Her Majesty's reception.

Sheffield.—Another of those attempts at explosion which have at various times excited so much alarm in Sheffield, was discovered last week in time to prevent the mischief intended. It appears that early in the morning a man named Almond, a penknife grinder, residing in Sidney-street, was awoke from his sleep by the breaking of a window in the bedroom underneath that in which he was sleeping. He directly jumped out of bed, and ran to the room where he heard the noise. He there found a ginger-beer bottle, with a burning fuse inserted in the cork. This he succeeded in putting out without injury, and on going to the window saw three men in the street below. He forthwith sallied into the street, and collared one of the three; upon which the other men attacked him and rescued their companion. The three then ran away and succeeded in effecting their escape. Two of them were in the course of the day captured by the police. On examination of the bottle it was found to be filled with gunpowder. It is said that Almond, who is a hard-working man, had left the union to which he belonged, that he might be enabled to obtain a living uncontrolled by union regulations. He had reason to know that his conduct had given offence, and, under the apprehension of danger, his wife had been afraid to sleep at home for four nights previous to the attempt.

Southampton.—A few days since died, near Beaulieu, Joseph Lee, the acknowledged monarch of that mysterious class of people the Gipsies. He was a native of Brockenhurst, in the New Forest, and was, it is said, in his 86th year. He is reported to have died worth a great deal of money.

Southwold.—The neighbourhood of Henham-park, the country seat of the Earl of Stradbroke, was thrown into a state of great excitement on Saturday last, by the rumour that his Lordship's headkeeper, whose name was Easey, had destroyed himself. This report was found to be true, the keeper having blown his brains out by means of a double-barrelled gun. The first surprise occasioned by this suicide had barely subsided, when the neighbourhood was again astonished by the self-destruction of a man named Cruxey, the superintendent of keepers, horses, and dogs, connected with the Earl of Stradbroke's establishment on that estate. This unfortunate man shot himself on Sunday afternoon in his own house on the Park estate, scarcely 24 hours after the death of his fellow-servant.

Sunderland.—Mr. J. C. Belaney, the surgeon who was tried last week at the Central Criminal Court on a charge of murdering his wife, and acquitted by the Jury after two days' trial, left London the day after his liberation, for North Sunderland. His return home, as well as that of some of the witnesses who appeared in his favour on the trial, has been the reverse of welcome. One party was stoned from the village; and on Wednesday an effigy was elevated on a pole, and, after being paraded for some time round the neighbourhood, was set fire to in the presence and amidst the shoutings of some hundreds of the population. A letter which appeared in the *Times* newspaper of Saturday week, strongly condemnatory of the Jury who tried and acquitted Mr. Belaney, has also been reprinted at Alnwick, and extensively circulated. The excitement in the locality of North Sunderland, where Belaney and his unfortunate wife were well known, and where her friends mostly reside, is described as being very great.

Railways.—Birmingham and Gloucester, 3026*l.*; Bristol and Gloucester, 1100*l.*; Eastern Counties, 4510*l.*; Edinburgh and Glasgow, 2665*l.*; Great Western, 18,170*l.*; Grand Junction, 9697*l.*; Glasgow, Paisley, and Ayr, 2014*l.*; Great North of England, 2305*l.*; London and Birmingham, 19,098*l.*; South Western, 7665*l.*; Blackwall, 1457*l.*; Greenwich, 886*l.*; Brighton, 6060*l.*; Liverpool and Manchester, 6217*l.*; Manchester, Leeds, and Hull associated, 8909*l.*; Midland, 10,636*l.*; Manchester and Birmingham, 3528*l.*; Newcastle and Carlisle, 1904*l.*; Newcastle and Darlington, 1103*l.*; Preston and Wyre, 740*l.*; South-Eastern and Dover, 6652*l.*; Sheffield and Manchester, 820*l.*; York and North Midland, with Leeds and Selby, 3330*l.*—The Blackwall Company held their meeting last week. No dividend was declared, the revenue account only showing an available surplus of 1730*l.* 5*s.* 6*d.* The Directors, however, state that this was the balance on the worst half of the year, and that there was a deficiency of 2411*l.* 4*s.* 2*d.* on the corresponding half of 1843, making, therefore, an actual increase of 4141*l.* 9*s.* 8*d.* in favour of the past half year. The number of passengers landed and embarked at the Brunswick Pier by the Gravesend boats during the past 6 months has been 394,506, while during the same period of last year the number was only 191,357, thus showing an increase in this branch of traffic of upwards of 100 per cent. Although the prospects of the railway have thus increased, the receipts of the winter months, it is stated, require a considerable advance, but the directors appear to rely with much confidence on the results to be expected from the Chatham and Gravesend line, by means of which they look for a generally augmented traffic. The workings for the past half-year, compared with the same period of 1843, show an increase of nearly 30 per cent. in the receipts, and of 50 per cent. in the numbers carried.—The Edinburgh and Glasgow Company at their recent meeting declared a dividend at the rate of 4½ per cent. per annum, the net profits for the six months having been 26,436*l.* 17*s.* 7*d.* It appears that the receipts on the line had been 55,866*l.* 16*s.* and the expenditure, including 9272*l.* 16*s.* 9*d.* interest on loans, 29,429*l.* 18*s.* 5*d.* The balance now standing to the company's credit, in addition to the 5000*l.* appropriated last year for the purposes of a depreciation fund, was 3030*l.* The directors have effected a reduction on 45,000*l.* of their loans from 5 per cent. to 3½ per cent.—At the first meeting of the Bradford and Leeds Company, it was announced that the Act had been obtained, and that the works of the railway had been commenced by the sinking of the shafts of the tunnel.—At the meeting of the Maryport and Carlisle

Company, the report stated that it will be completed within six months, and that the cost of its construction will not exceed the estimated sum of 320,000*l.*, being at the rate of 11,500*l.* per mile.—At the half-yearly meeting of the Yarmouth and Norwich Company, the report showed, that from the 1st May to the 18th inst. the gross receipts amounted to 6265*l.*, a sum considered to show very favourable results, as the goods traffic has not yet commenced. No dividend was declared, the opening of the line having been so recent.—At the Hull and Selby meeting, the dividend declared was at the rate of 5 per cent. The report stated, that during the half year 95,089 passengers had travelled on the line, being an increase of 14,540 over the corresponding period of 1843. The increase in goods traffic had also been considerable. Resolutions were passed for applying to Parliament for an Act to amalgamate the Hull and Selby and Manchester and Leeds Company, and also for an Act to authorise the construction of the proposed branch to Beverley, Driffield, and Bridlington. To provide the necessary funds for this branch, 8000 half-shares are to be created of 5*l.* each, which are to be offered to the original proprietors in the Hull and Selby at par. The newly-projected line from London to York, it is stated, will increase the traffic of the Hull and Selby Railway, should it be carried out.—At a meeting of the Brighton and Chichester Company last week, the Report stated that, in the prosecution of the Bill before Parliament great opposition had been experienced from the landowners on the line, but the demands of these had all been amicably arranged. Great assistance had been received from the Duke of Richmond, to whose efforts they were in a great measure indebted in passing the Bill. An arrangement had been come to with the Duke of Norfolk for the purchase of the bridge which was erected by his Grace over the river Adur, for 42,000*l.* Out of the original number of shares, 1180 remained, which had not been taken up, and these the Brighton Company had offered to take, provided they were allowed the option of leasing the line within three months after the completion of the railway, guaranteeing to the shareholders 4½ per cent. on their capital, with a division of the profits beyond that amount. The Report was adopted, with a resolution accepting the proposal of the Brighton Company. A resolution was also passed empowering the directors to take steps for the formation of a line from Chichester to Portsmouth. —A new railway from Liverpool to Manchester in opposition to the present one is in contemplation. It is intended to commence at Sutton, pass through Ince, Runcorn, and Warrington. The route is said to be favourable for the construction of a railway at comparatively little cost. At a preliminary meeting at Birkenhead a few days back, six gentlemen, representing 1,700,000*l.*, were present, and expressed a sanguine opinion of success. The new line is intended to be conducted on the principle of low fares and a large traffic. —A meeting of the Chester and Holyhead Company was held last week, at which it was understood that a proposition of an annual grant of 30,000*l.*, with contingent advantages to the line, had been made by Government. This intelligence has caused a slight advance in the price of shares.—The Grand Junction Company have intimated that they are about to make arrangements for putting second-class carriages on the line, so as to meet those of the Birmingham and London at Birmingham.—The Liverpool and Manchester, and Grand Junction Companies, have it in contemplation to have a statue to Mr. George Stephenson, the eminent engineer, executed by the distinguished sculptor Gibson, and erected in some public place in Liverpool.—The Great Western Company's first excursion-train from London to Bath, Bristol, Taunton, and Exeter, left Paddington on Monday morning with nearly 500 passengers, the fares for the holiday travellers having been reduced one-half. At Slough, Reading, and the several stations along the line, the numbers were considerably increased, amounting in the aggregate to nearly 1000 passengers.—Sunday being the last day for the cheap excursion to Brighton and back, the terminus at London-bridge was besieged by nearly 3000 people. At seven o'clock they commenced sending them off in batches. The first lot consisted of 700, who were conveyed in 25 carriages, propelled by three engines; the second of 20 carriages, containing 540; and the third of 40 carriages, containing 1000. The latter train was propelled by six engines. The whole of the passengers returned home by 10 P. M., in two monster trains, without encountering any accident.—Prince William of Prussia, who left Bristol on Saturday afternoon, in a special train, arrived at the Slough station in two hours and seven minutes, the distance being exactly 100 miles! The engine attached to the three carriages comprising the special train, proceeded along some portions of the line at the rate of 65 miles an hour! His Royal Highness reached the Castle, from Slough, in one of the Queen's carriages, and was in the presence of her Majesty within two hours and a half from the period of his departure from the Bristol terminus.—According to the testimony of Captain Laws, the manager, as given before the railway committee, the original cost of a first-class carriage on the Manchester and Leeds line is between 300*l.* and 400*l.*, and the renovation of lining, painting, &c., amounts to about 150*l.* a year. This carriage will carry but eighteen persons, whereas a third-class carriage on that line will take forty persons, and costs at first only about 120*l.*, with about 10*l.* per annum for repairs.—The South Western Railway Directors have announced their intention to apply forthwith to Parliament for leave to make a direct line from Salisbury to Exeter, and Mr. Locke the engineer is at present surveying the country. The saving of distance is about 30 miles, and the route will include the populous towns of Yeovil, Sherborne, &c.

IRELAND.

Dublin.—The reversal of the judgment in the case of Mr. O'Connell and the other state prisoners was expected to be known in Dublin on Thursday night. Government messengers were sent off immediately after the decision of the House of Lords with despatches for Her Majesty at Windsor, and for Lord Heytesbury, the Lord-Lieutenant of Ireland, informing him of the reversal of the sentence. The object of the special messenger to Windsor, it is said, was to obtain Her Majesty's signature to the necessary warrant for the immediate release of Mr. O'Connell and his fellow-prisoners; and although some delay is unavoidable in such cases, the despatch used enabled Government to place the warrant in the hands of Mr. Gartlan, one of the agents for the traversers, on Thursday afternoon. That gentleman left town immediately, and was expected to arrive in Dublin last evening. It is rumoured, however, that Government had anticipated the formal and somewhat tardy process of the law, and had sent over instructions to the Lord-Lieutenant to discharge the prisoners.—The weekly meeting of the Repeal Association took place on Monday. Mr. O'Hea, barrister-at-law, on taking the chair, called the attention of the meeting to the fact that, since the imprisonment of Mr. O'Connell, the chairmen at their weekly assemblages had been hitherto men of rank and station, but that the committee had, on the present occasion, deviated from the usual principles which regulated the selection of persons for that high honour, and had nominated so humble an individual as himself, in order to show to the lowest members of the Association that the highest honours that it could bestow were open to them as well as to their superiors in wealth and influence. The chairman then proceeded at great length to argue that the decision which the House of Lords might come to upon the writ of error would not in any way be proof of either the justice or injustice of the recent proceedings in the state trials. He warned the people not to be led away by the arguments of the Conservative press, which would be industriously put forth in the event of an adverse decision, to persuade them that those trials had been right or just; for they were to remember that it was upon the proceedings on the record that the House of Lords was to decide, and not on the merits of the case. If, therefore, the judgment of the lower Court was affirmed by the Supreme Court—as he considered probable—he anticipated that the assertion which the Premier had made in his place in Parliament, that the prisoners had a fair trial, would be triumphantly reiterated again and again; and he took that occasion to warn them of its fallacy. He congratulated the Association on the bright prospects which the present state of political affairs opened to all who desired the welfare of Ireland. War was impending, and, indeed, seemed unavoidable. In such an event occurring Sir R. Peel said he relied upon the loyalty of the Irish people. He was right, however: he might rely that the Irish would be found like a wall of fire around their Sovereign; but was it reasonable to expect that they would bear the brunt of the battle and reap no advantage from the victory? The Tangier pepper would very likely season some agreeable condiment, of which the Irish would be called upon to partake, but then was their time to make their own terms. It was scarcely wise to press and strain too much upon the well-known loyalty of the Irish people in every season of difficulty, more especially as it had ever been in time of war and danger that their rights had been partly conceded to them. Everything which passed along the political horizon was calculated to inspire the Association with confidence and hope, and he firmly believed that the day was not far remote when the shadow of a mighty event to come would be lost in the bright reality of an Irish parliament. After several sums of money had been handed in, Mr. Dillon Brown, M.P., read a letter from Mr. S. O'Brien, calling upon the electors to attend to their qualifications, and on Repealers of all ranks to be sure to register their votes. In moving the insertion of this letter on the minutes, and the marked thanks of the meeting to its writer, Mr. Brown said he would call the attention of the Association to two matters of paramount public importance—the present relations between England and France, and the intended visit of Her Majesty to Ireland. The demeanour of the Irish people in case of the latter event taking place was of high importance, for the eyes of the world would be upon them; but it sank into insignificance when compared with the former topic. A French fleet was sweeping through the Mediterranean. Now it was a melancholy fact that the political aphorism that "England's weakness was Ireland's opportunity" was only too true. With one exception Ireland had never gained a concession except by the arms of France—by the arms of America—or by some intestinal tumult. The present time was the hour of England's weakness. ("Bravo!" cheers, and cries of "More power.") The hon. gentleman then proceeded at large to consider the present state of the Mediterranean, which he considered most perilous to English interests. He dealt in abundant eulogy of the Prince de Joinville and the French navy. If England's forces were engaged in the Oregon or Cabul what was to prevent the Prince de Joinville, who had already seized upon one of the pillars of Hercules, from ascertaining whether Calpe's boasted rock was indeed inaccessible? Whom would England have to support her in such a contest? Would Russia support her? or Mehemet Ali? or the Pope? The English had applied the term of "cowards" to the gallant navy of France. The noble spirit of Condé leaped into life at the word in the youthful presence of the Prince de Joinville, who had answered it with the thunder of his cannon against Tangier. (Great cheering for some moments.) With respect to the Queen's visit, he could not help considering it as an ill-timed visit. Even were O'Connell liberated it would not be less so, for such an act would not be taken as a boon. Injustice had been done to the Irish people, and they would not come crouching before any sovereign or minister on earth. Should Her Majesty come, therefore, he, for one, would not shout in her train. Ireland was now a house of mourning—O'Connell was in prison—and no idle or ostentatious pageant should be introduced upon her mourning. (Renewed cheering.) Should Her Majesty come over he trusted she would take pains to learn the real condition of their country, and, passing by the transient glitter in the streets of Dublin, to look to their mockery of an Exchange, their deserted Custom-house, and their ruined trade, he hoped she would pass through the country and behold the semi-naked, shoeless, half-starved human being, who called himself the subject of the proud Victoria. (Much cheering and groaning.) Let her contemplate a peaceable, sober, intelligent, loyal people, and when she returns to her Ministry let her exclaim, "Is such a country, so blessed by Providence, to be permitted to remain in that state of ineffable misery—of dangerous despair?" Mr. D. O'Connell, jun., brought forward the following report from the Penitentiary:—"No. 1. Usual report—excellent health and spirits. 2. The decision of the judges to be waited for with the utmost indifference. The 11 questions referred to the English judges being so framed as to exclude the consideration of the great merits of the case of the traversers—in particular, no question arises upon the charge of the Chief Justice—a charge that nobody has been found either in or out of the houses of Parliament to defend—yet the traversers are deprived of any advantage from the illegality of that charge. 3. The traversers are also deprived of any benefit from the Irish judges having admitted newspapers as evidence of the facts therein contained against the traversers. It is quite manifest that this evidence would not have been received by the Court of Queen's Bench in England, yet the traversers are deprived of any benefit arising from the illegality of that evidence. 4. The 11 questions submitted to the judges are framed in the most unfavourable way for the traversers; and can be met and answered negatively, on technical reasons totally independent of and unconnected with the merits. 5. Under these circumstances it would be quite idle to expect anything favourable from the decision of the English judges. Let the people, therefore, throughout Ireland receive with the utmost tranquillity, and without the slightest irritation, the announcement of an unfavourable decision by the judges. 6. Mr. O'Connell is thoroughly convinced that the tranquillity of the country will be unimpaired, and that the remainder of the imprisonment will pass away with the same tranquil forbearance on the part of the people that has marked the three preceding months. In the present state of the political world, there is no need of impatience; tranquil perseverance, that is, perseverance accompanied by perfect tranquillity, will insure beyond a doubt the repeal of the Union. 7. Mr. O'Connell is very anxious that the gentlemen engaged in the late registry in the city of Dublin should be sensible of his deep gratitude to them for their patriotic and disinterested exertions, and in particular Counsellors Mackay and Burke, who deserve the thanks of the Association for their legal acumen and patriotic exertions. These gentlemen have set a most laudable example to other patriotic barristers and attorneys. 8. It is most desirable to follow up the exertions for registry in the city of Dublin, and in particular to apply to the Protestant operatives and tradesmen to procure them to join in the Repeal Registration. The Protestant operatives and tradesmen have the same, if not a deeper interest in the repeal of the Union than the Catholics, and it is quite certain that no candidate will get the support of the Liberal interest at the next election but a Repealer, no matter what his religion may be—that is utterly immaterial to the public. Mr. O'Connell thinks that there would be no objection at all to vote for the present members if they declared themselves Repealers, as they assuredly ought, if they consult the material interests of their constituents. 9. Everything must be done to procure the registration to be universal throughout the counties at the next session. But this subject is so powerfully taken up by that inestimable patriot, Smith O'Brien, that any details had better be reserved for his return to town. 10. Peace and perseverance—tranquil perseverance. It is manifest that political events are thickening into such consistency as will render it impossible that Ireland shall not peaceably attain justice." Mr. Gordon rose to give notice of the following resolution for the next day of meeting:—"That in the event of a war with France, to resolve that an extraordinary general meeting of this Association be called exclusively for the purpose of taking into consideration the propriety of reviving the Volunteer Organisation of 1779 and 1782, by means of which the people of Ireland protected their country from the foreign foe, in circumstances similar to those which now threaten the security of the three nations, as well as the general peace of the world; and under which they also wrung from the oppressive and anti-Irish ministerial factions of these periods, Freedom of Trade, and Legislative Independence."—Mr. Brown, M.P., objected to the resolution, contending that its adoption would bring them into collision with the Government, and appealed to the chairman, as a lawyer, whether such

would not be the case? The chairman expressed his opinion to that effect, and Mr. Gordon then consented to withdraw the resolution. Mr. M'Nevin, Rev. Mr. O'Reilly, General Clooney, and Town-Councillor Reilly addressed the meeting; after which Mr. Dillon Brown, M.P., announced the rent for the 13th week of the captivity to be 735*l*.—The Repeal Papers still advert to the prospect of a war between England and France, and the *Freeman* last week had a remarkable article, headed "A New Battle Ground for Europe," in which it speculated on the possibility of an invasion of England. It says—"Suppose a French army landed at Hastings, what is to stop its march to London? There are no towns to take, no fortresses to mask. It may be pleaded that England has armies to oppose the landing and the march. She has not. There are no troops in England to oppose 100,000 Frenchmen. There are not in the entire of England more than 40,000 troops, and of these not two-thirds could be moved against an invading army. But England has inhabitants; organise the mining districts—arm the manufacturing! Even if the inhabitants of both were the most unreflecting supporters of present systems, before arms could be placed in their hands, and they trained to the use of them, half England would be overrun. In all human calculation, an army of Frenchmen in England would occupy London almost without a blow. From the metropolis the route to Birmingham and Manchester, to York and Leeds and Sheffield, is obvious and easy, and Liverpool affords at once an outlet for debarkation, and a fit object of attack. If such an event should occur—and who shall say that its occurrence, and at no distant period, is impossible?—where would be the wealth, the commerce, the manufactures of England? Where her colonies?—where her power? No wonder then that England should dread a rupture with her neighbour, France. No wonder she should be forbearing—nay, long-enduring. Let a war but commence in Europe, and England will be the battle-ground. In that case she must again proclaim her incapacity to protect Ireland. But we can have no anxiety for this country; we should then, as in '82, unite for the protection of our native land. Let a French force but threaten England, not invade her, and the legislative independence of Ireland is *un fait accompli*. England must concede—nay, press upon her—an independent vitality to give her the capacity for an independent defence."—Father Mathew recently paid a visit to Mr. O'Connell and his fellow-prisoners, which has given rise to some misconception in regard to the reverend gentleman's views on the subject of Repeal. In a letter to Dr. Sheil on this subject, Father Mathew says: "My late visit to Dublin was the first since the imprisonment of Mr. O'Connell and the other gentlemen. The former has honoured me with his friendship for more than 20 years, and the latter for six years. Three of those, Messrs. Gray, Ray, and Duffy, are faithful teetotallers. Not to visit such individuals in prison would be culpable in the extreme, and an act of political partisanship. As to Mr. Smith O'Brien's repeal pledge, I candidly say I approve of it, so anxious am I to put a stop to intemperance. Such is my aversion to the use of intoxicating drinks, from a conviction of its danger, that I would exult in its being abandoned by any, or by every one even for a day. Mr. Smith O'Brien's pledge does not make a man a teetotaller or a member of our glorious society, and I have no connection with it. I thank you for your vindication of my sincerity, and you can do so with confidence, as I never violated that strict neutrality on politics on which I based the total abstinence movement."

Law.

HOUSE OF LORDS—WRIT OF ERROR—THE O'CONNELL TRIAL—OPINION OF THE JUDGES.—The House of Lords met again on Monday after their adjournment, for the purpose of receiving the opinions of Her Majesty's Judges on the writ of error in the case of "The Queen *v.* O'Connell and others." The doors were thrown open at a few minutes after ten o'clock, and the galleries allotted to strangers and to the members of the House of Commons or their friends were immediately crowded. The very limited space, too, below the bar was soon filled by the counsel engaged in the cause and those more directly interested in the proceedings. The Bishop of Lichfield, as junior Bishop, having read prayers, the Learned Judges were called in, and the Lord Chief Justice of the Common Pleas, and the Lord Chief Baron of the Exchequer entered, and took their seats together at the top of the clerks' table. On two benches, one on the Ministerial side of the House and the other on the Opposition, sat the remainder of the Judges. There were present Barons Parke, Gurney, and Alderson, Justices Patteson, Coltman, Williams, Wightman, and Maule. Among the Peers present were the Duke of Cambridge, Lords Dalhousie, Delawarr, Strangford, Redesdale, Beaumont, Brougham, Campbell, Cottenham, Denman, Boston, and Tankerville. Before each of the Law Lords a desk was placed, as is the custom during the judicial business of the House, and every one of them, from time to time, took notes of the decisions of the different Judges as they proceeded. Lord Brougham seemed especially attentive, and during the course of the day sent several times for various statutes and reports, to which he kept referring. The Lord Chancellor having taken his seat, the Judges gave their opinion on a case of minor interest which had been referred to them. Lord Chief Justice Tindal then proceeded to state his opinion in the case of "O'Connell *v.* the Queen." The first question was, whether any of the counts in the indictment were bad in law. To constitute the crime of conspiracy two or more persons must agree to do a thing unlawful in itself, and the gist of the offence is that the parties should agree together to do a thing forbidden by the law. The 1st count objected to was the 4th. The previous counts were not and could not be objected to. They contained a definite charge against the defendants to do an illegal act. With respect to the 6th and 7th counts, the Judges all agreed that they did not state the illegal purpose for which the defendants conspired with sufficient certainty to lead to the conclusion that the defendants intended to do an illegal act; for the words "intimidation" and "physical force" were not sufficiently defined. The objects stated in the 8th, 9th, and 10th counts were illegal acts, each and every offence being a violation of the law. So that as to the first question they were of opinion, that the 6th and 7th counts were bad in law, and if they had stood alone the judgment could not be supported. On the second branch, as to the finding of the jury on the 1st, 2d, 3d, and 4th counts, the Judges concurred in opinion, that the finding of the jury, and the entry of the finding, on these counts, were not supportable in law. With respect to the 3d question, whether there was any sufficient ground for reversing the judgment by reason of any defects in the indictment, or of the finding of the jury, or the entry of the finding, there existed a difference of opinion amongst the Judges, and he therefore stated only his own individual opinion upon this question. The learned Chief Justice then entered very minutely into the legal grounds of his conclusion, that the judgment was irreversible on the ground of the four defective counts (the 1st, 2d, 3d, and 4th). The judgment proceeded on the good counts only, and if so, the whole difficulty was at an end. With regard to the second branch of the question, he was of the same opinion, and generally he was of opinion that there was no sufficient ground for reversing the judgment by reason of any defects in the indictment, or in the finding, or the entry of the finding, of the jury. The Judges all concurred in opinion that there was no sufficient ground for reversing the judgment on the matter of the plea in abatement. On the 5th question, as to the continuation of the trial, which it had been objected was conditional, the Judges were of opinion that the order was perfectly legal, and that the trial was properly continued, and that this question should be answered in the negative. With respect to the 6th question, whether there was any sufficient ground for reversing the judgment because of the Court's overruling or disallowing the challenge of array, they were of opinion that the sheriff had not acted improperly, or illegally, and no object could have been obtained if the challenge had been allowed, for the jury must have been chosen from the same book, and the jury might have been again objected to, and so on *toties quoties*, and there would thus be no trial at all. The Judges, therefore, answered this question in the negative. The next question was, Did any ground exist for reversing the judgment by reason of any defect of entering the continuances from the day of trial to the 15th of April? The Judges upon this point were unanimously of opinion that there was no ground under the statute, and that it was in effect a Parliamentary continuance of the cause, and that no discontinuance did in fact take place. On the 8th question, the Judges were of opinion that there was no ground for reversing or varying the judgment on account of the sentences pronounced, with regard to the recognizances and terms of imprisonment. The only difficulty was in the form of the order of entry of the recognizances and of the terms of imprisonment. On the 9th question, whether there was any ground to reverse the judgment on account of the judgments on the assignments of error *coram nobis*, the Judges thought that, under the statute, the decision of the Court in Ireland might be supported, though, if the matter were *res integra*, a question might perhaps be raised; but upon a reasonable construction of the statute, and the practice of the Court, they thought the objection had been answered, and that there was no ground for reversing the judgment on this point. The 10th question was, whether the judgment should be reversed by reason of its not containing any entry as to the verdicts of acquittal, and the Judges were all of opinion that it should be answered in the negative. With respect to the 11th and last question, he (the learned Chief Justice) gave only his own opinion. The question was, Whether, the entry on the record being that the defendants should be fined and imprisoned "for the offences aforesaid," that of itself was a ground for reversing the judgment? He took the words, "the offences aforesaid," in their ordinary sense, meaning the offences laid in the 5th, 8th, and subsequent counts, and contained in the good findings, and he was of opinion that this question should be answered altogether in the negative.—Mr. Justice Patteson then delivered his opinion on the 3d and 11th questions, to the effect that the badness of the finding on some of the counts did not affect the verdict and judgment upon the whole of the indictment. There was a case in which a finding upon a single count, when all the rest were bad, was supported upon a writ of error, Reg. *v.* Owen, 2 Barn. & Ald. 75. Assuming that the judgment would have been bad upon some counts by reason of the defective finding upon some counts, still the whole judgment would be good.—Mr. Justice Maule followed, concurring with the Chief Justice and Mr. Justice Patteson.—Mr. Justice Coltman then delivered his opinion, to the effect that, with respect to the 3d question, there was sufficient ground for reversing the judgment; and on the 11th question he considered that in an indictment of 3 counts, A, B, and C, if A and B were good, and C bad, a judgment against a defendant, though confined to counts A and B, ought to be reversed on error. If the defendant were to be tried again for the offence laid in count C, how could the Court know the fact of *autrefois acquit* so as to prevent the party being tried again for the same offence? According to his opinion, if one count in the indictment was bad, the judgment was erroneous, because it did not state on what counts the sentence was passed.—Mr. Justice Williams said, the difference of opinion substantially arose on the 11th question. There was no difference on the merits, and there was no doubt that there were good counts in the indictment, which would sustain an exceptionable judgment. The objections in the writ were purely of a technical nature, and must be technically treated. The difference upon the 11th question had been put by Mr. Justice Coltman, as whether, where, of three counts in an indictment, two were bad, a general verdict and general judgment could or could not be sustained. The learned judge cited various cases, and urged reasons for an opposite conclusion to that of his learned brother, and for agreeing with the Chief Justice that there were counts which would sustain the judgment pronounced "for the offences aforesaid," which were not the offences contained in the counts bad in law, or in the defective findings, but on those good in law.—Mr. Baron Gurney concurred with the Chief Justice and the other Judges who took the same view of the 3d and 11th questions.—Mr. Baron Alderson felt very strongly that an opposite decision of their Lordships to that of the Court below would be productive of much mischief; and he rejoiced, therefore, that, in this technical question, he agreed with so large a majority of his learned brethren. It was the universal belief and impression of the profession that a judgment upon an indictment with bad and good counts was not reversible; such a judgment was given upon that part of the offence which was indictable. It was easy by the exercise of a poetical imagination to suggest possible inconveniences; the law, however, did not profess to be a perfect system, but practically no evil resulted from the course in question, which, though it might be unreasonable in civil cases, was reasonable and just in criminal cases. The Court always gives judgment on the good counts; a count that is bad is bad because it charges no offence, and the Court below in this case pronounced judgment on the "offences aforesaid"—that is, the offences contained in the good counts alone.—Mr. Baron Parke said, he regretted that, after the best consideration, he could not bring himself to agree with the majority of his learned brethren, on the 3d and 11th questions. Where an indictment consisted of several counts bad and good, each ought to have been brought to a decision and finally disposed of upon the record. There was a prevailing opinion that one good count in an indictment would support a judgment, but it appeared to him to have grown up without adequate grounds. The defendants ought, therefore, in his opinion, on the face of the record, to be put in the same situation as if each count had been a distinct indictment.—Mr. Justice Coleridge was prevented by illness from being present, but Lord Chief-Justice Tindal stated that that learned Judge had sent his written opinion, in which he expressed his concurrence with the majority of his learned brethren. The majority of the opinions of the Judges (nine in number) were thus against the writ of error. The House was then adjourned until Wednesday.

JUDGMENT—REVERSAL OF THE SENTENCE.—On Wednesday the House met to pronounce judgment. The LORD CHANCELLOR first proceeded to deliver his opinion. When the writ of error was first heard at their Lordship's bar, it occurred to him, as no doubt to many of their Lordships, that to avoid all possible suspicion, or pretension of suspicion, of political bias, the assistance of the learned Judges should be requested. Those learned persons had patiently given their assistance, and had now delivered their opinion. Except upon one point their opinion was unanimous, and upon that point the dissent of the minority was expressed with much doubt and hesitation. Unless therefore their Lordships could believe that the opinion of the majority of the Judges was founded in palpable error, the judgment of the Court below ought to be affirmed. The noble and learned Lord then stated the nature of the question. By the law of England a general judgment, notwithstanding any defective count in the indictment, was sufficient. That was the rule in criminal cases, laid down by Lord Mansfield in clear and comprehensive terms. It was concurred in by some of the ablest Judges that ever adorned the bench, and until in this case he had never heard it questioned. It was stated that the rule applied only to motions in arrest of judgment. He was satisfied there was no ground for that exception. But it was said that otherwise it could not be shown what portion of the judgment might be awarded in respect of the defective counts. Unless there was proof to the contrary, it must be assumed that the judgment was based upon the valid part of the indictment; but on the face of the record in this case was there any ground for the objection? The judgment was, that the party for the "offences aforesaid" be fined and imprisoned. Some of the counts were bad because the offence was not clearly stated. How, then, could it be said that the judgment was based upon those counts which stated no offence? Such a conclusion would be an incongruity and inconsistency which their Lordships would not sanction. The same reason would apply to those counts upon which the findings had been wrongly entered. They were a nullity. Upon the face of the record, therefore, there was no defect whatever. The noble and learned lord then referred to various authorities in support of that opinion. They were cases of motions in arrest of judgment; but it was said there was a distinction between motions in arrest of judgment and writs of error. He denied that distinction. However, in writs of error he might refer to several authorities of modern date, where the same objection lay upon the surface, but was never taken. The principle which he had stated was supported by authorities from the time of Lord Holt downwards; it had been considered as free from all doubt, and established as law. But it was urged that a difficulty would arise from not distinguishing the counts, in the case of a party pleading *autrefois acquit*. There was no ground for such objection, for the plea must be a plea of acquittal of the *corpus delicti*, and that would not apply here. Then it was said there was no decision upon this point. But was not that a stronger proof that the law was as he had stated? It was usage, practice, and recognition that constituted the law, and this principle had never before been doubted. Even the learned Baron who dissented admitted that he now heard it for the first time. Nothing, then, but a case clear of all doubt could justify their Lordships in differing from the majority of the learned Judges upon this objection. He would refer briefly to another point, the challenge to the array of the jury, because, although the other Judges were unanimously against the objection, his noble friend the Lord Chief Justice entertained a strong opinion in its favour. There was but one principle upon which that challenge had ever been allowed—either the position or conduct of the sheriff. If he were not indifferent, or were negligent, that was a ground of challenge; but in this case nothing of the kind was imputed by the record. In making up the jury-book for so large a city as Dublin, it was almost impossible that some mistake should not arise; and if this objection were allowed it would be of constant occurrence. The proper remedy, too, was not by challenge. Upon this point he entertained no doubt. As to the question of the continuance of the trial, the opinion of the learned Judges was complete, and it was therefore superfluous for him to enter upon it. The plea of abatement was also in his opinion insufficient. He therefore called upon their Lordships to affirm the opinion of the majority of the learned Judges, in opposition to the doubtful and hesitating opinions expressed by two highly distinguished members of that learned body. The noble and learned Lord then moved that the judgment of the Court below should be affirmed.—Lord BROUGHAM followed. The majority of the learned Judges had upon the questions relative to the defective counts given their clear and decided opinion in favour of the validity of the judgment, although given generally upon the indictment. Two learned Judges had dissented from that opinion, but Mr. Baron Parke was the only one who had entered at length into his objections to it, and even that learned Judge had expressed but a doubting and hesitating opinion, and concluded by saying that he doubted whether he ought not to *advise* their Lordships to affirm the question—a very incorrect expression, for the learned Judges were there to deliver their opinion, not to offer their advice. In the opinion, however, expressed by the majority upon the point in question he most entirely concurred. Upon the 6th and 7th counts, upon which the learned Judges were unanimous, he could not agree with their opinions, or perhaps he ought, like the learned Baron, only to express a doubt of their correctness. The noble Lord then entered at length into the consideration of the 3d and 11th questions, upon which, as he had stated, his opinion went with the majority of the learned Judges. It was said that there was no decision upon the point; but how much of the law rested on the same foundation, for this simple reason, that it was so clear that it could not be questioned? After having referred to the various authorities, the noble Lord said he found himself in this predicament:—The learned Judges were unanimous on the merits of the case:—that a grave offence, punishable by law, had been perpetrated, they agreed; but bad counts happened to be found in the indictment—elaborate and learned arguments had been urged at the bar—the learned Judges had deliberated upon them, and seven out of nine had decided against the writ of error upon that objection. From whom, then, were they to take their statement of the law? From the majority, who had given their clear and unhesitating opinion, or from the two who expressed themselves with doubt and hesitation? There was no dictum in support of the opinion of the latter, and he therefore thought it the better course to concur with the majority. The next point was the challenge to the array. The real question was, whether the jury were well selected, for that was requisite to the proper construction of the Court. The right to challenge was on the ground of indifference or misconduct on the part of the returning officer. There was no imputation of that kind on the record. If the objection were good for many names having been omitted, it would be good for one, and it would be going a great way to say that on such a ground the jury was improperly empanelled. On that point, therefore, as on the remaining points, he agreed with the majority of the learned Judges.—Lord DENMAN then delivered his opinion. He would first refer to the overruling of the challenge to the array, not only because it was preliminary in the proceedings, but because it was a matter of such extreme importance as not to admit of any exaggeration of the effects which it might hereafter produce in the administration of justice. If such a practice were allowed, a trial by jury, instead of being a protection, would be a mockery, a delusion, and a snare. It appeared to him that the challenge to the array on the ground of the omission of several names ought to have been allowed. He thought the principle of the challenge was not the question whether the Sheriff had done right or wrong, but whether the party had had a lawful jury for his trial. Upon that point he felt so strongly, and was so entirely unconvinced by the reasoning of the learned Judges in Ireland, that, being unable as a Peer to attend the consultation of his brother Judges, he wrote to Mr. Justice Coleridge, who was also prevented from attending, on the subject, and from the answer of that learned Judge he felt himself entitled to say he did not stand alone in his opinion. In the judgment he had formed, he and his brother Coleridge thought that the duty of making the jury list did not rest now as formerly with the Sheriff alone, but was by the late statute divided between the tax-collectors, the Quarter Sessions, i. e., the Recorder, and the Sheriff. The Recorder had a judicial office to perform, and it seemed to him and his learned brother that in this case, after the Recorder had decided

upon what should form the jury list, some other person had said "No; not that, but this (the noble and learned Lord illustrating his argument by dividing a sheet of paper at the time, shall be the list." The noble and learned Lord on the woolsack said the challenge was not the proper remedy for the defect; but he did not state what was the proper remedy if that were not. He (Lord Denman) considered that it was, and until he saw that ancient security for a fair trial repealed by Act of Parliament, he should consider that it still existed. He was therefore of opinion that the challenge ought to have been allowed, and that the trial had erroneously proceeded. He did not entirely agree with his learned brethren that there were only two objectionable counts; he believed there were others: and the question was, Whether, under the circumstances, the sentence was properly awarded? The noble and learned Lord on the woolsack said it must be assumed that the judgment was awarded upon those counts that were good; but here there was a difference between the Judges of England and of Ireland, for the latter held that the 6th and 7th were unexceptionable, whilst the former were unanimously of a contrary opinion. How, then, could it be said that the sentence awarded in a Court where certain counts were considered good, was pronounced upon those that were good, when some of such counts were held in the House of Lords to be defective? His surprise at the objection being taken had changed to surprise at what was stated to be the law. In his opinion the law was not as it had been laid down by the majority of the Judges. He could state from his own experience that it was not the universal practice that a judgment was given generally upon all the counts of an indictment, and the difficulty might be obviated by the Court stating upon what counts their judgment was awarded. It was said that the objection was only technical, but he thought that great injustice might be done, as a criminal charge against a party ought to be clear and distinct. In the several cases which had been referred to, the offences charged in the various counts of the indictments were in effect the same, and the objection, therefore, would not have applied to them. Judgment, then, having been pronounced upon an indictment generally, parts of which indictment were now held to be bad, it could not, in his opinion, be affirmed by their Lordships. It was not supported by the reasoning and arguments that had been adduced, and he should therefore oppose the motion.—Lord COTTENHAM said, that after the fullest consideration he had come to the conclusion that the opinion expressed by the majority of the learned Judges was wrong. He had formed his opinion early in the argument, and had heard no reasons since given why he should change it. The noble and learned Lord examined at length the various cases upon the point of the indictment containing some defective counts, and expressed his opinion that on that ground the judgment, having been pronounced upon the indictment generally, was erroneous.—Lord CAMPBELL, after stating his opinion that the indictment contained some good counts, that the plea in abatement was bad, and the continuance of the trial legal, addressed himself to the question of the challenge to the array. The parties ought not to have been tried by a jury struck from the defective list, but on the challenge, the panel ought to have been quashed. On that point, however, after the opinion of the learned Judges, he should have hardly felt justified in voting for a reversal of the judgment; but agreeing with Mr. Justice Coltman and Mr. Baron Parke in their opinion on the point of the judgment having been given generally upon the indictment, notwithstanding the defective counts, he thought that the judgment could not be sustained. The noble and learned Lord concluded by moving that the judgment be reversed.—The Lord CHANCELLOR then put the question, "Is it your Lordships' pleasure that this judgment be reversed?"—Lord DENMAN, Lord COTTENHAM, and Lord CAMPBELL said "Content."—Lord BROUGHAM, and one or two other Noble Lords, said "Non-content."—The House was then about to divide, when Lord WHARNCLIFFE, who remained sitting and covered, said that he must suggest to the House the inconvenience which would arise upon dividing on a subject of this kind. In point of fact they were now sitting as a Court of Appeal, and if noble Lords who were unlearned in the law interfered, he very much feared that the authority of the House as a Court of Justice would be very seriously affected. He therefore humbly recommended such of their Lordships as had not heard the whole case—and who, in fact, were not qualified to pass a judgment—to abstain from voting on the present occasion. It was from the fear that the character of the House as a Court of Appeal, and as a Court of Law, might be injured, that, even though their opinion might be contrary to the opinions of the Judges, and though it might possibly in this one instance produce inconvenience, he said that it was much better for them to concur with a majority of the Law Lords, who, by their station and education, were most fitted to decide such questions as these.—Lord BROUGHAM said that he entirely concurred in the opinion of the majority of the Judges in Ireland and England. But he also agreed with the Noble Lord who had just spoken, that it was more advisable that those of their Lordships who had not heard the case should not vote. He deeply lamented the division to which the House would come: but he would now only say, that when he differed from the majority of the Judges on the question of Presbyterian marriages in Ireland, he did so upon the authority of that great Judge Lord Stowell.—Lord CAMPBELL said that he had voted with his Noble Friend on the question of Presbyterian marriages, and for the same reason. In that case he opposed the opinion of a majority of the Judges, because he believed that their opinion was contrary to law; and he did the same in the present case. With respect to what had been said by the Lord President of the Council, the distinction between Law Lords and Lay Lords was not known to the House or to the Constitution, but it was the rule of all Courts that no Judge should decide a case at the hearing of which he had not been present.—The Earl of EFFINGHAM was understood to say that as he had paid great attention to the case, he considered that he had a right to vote.—The Marquis of CLANRICARDE said, "If any Noble Lord not learned in the law votes on this question, as a matter of privilege I shall think it my duty to vote also. I should be sorry to be reduced to the necessity, for I think that it would be one of the most calamitous events for this House and the country that could occur."—The Earl of VERULAM—"My Lords, I shall leave the House, as I have not heard the whole of the discussion."—All the Noble Lords not Law Lords then went to the space in front of the throne, which is not considered to be within the House, and the Lord CHANCELLOR put the question, "Is it your Lordships' pleasure that this judgment be reversed?"—Lords DENMAN, COTTENHAM, and CAMPBELL having said "Content," and Lord BROUGHAM "Not Content," the Lord CHANCELLOR said: "THE JUDGMENT OF THE COURT BELOW IS REVERSED."

SUMMER ASSIZES.—NORTHERN CIRCUIT.—LIVERPOOL.—*Crosskill* v. *Grounsel*.—This was an action for the infringement of a patent. The plaintiff, who carries on business at Beverley, in Yorkshire, had, it appeared, taken out a patent for certain improvements in an agricultural implement called a clod-crusher. The old machine for this purpose consisted of a number of metal disks, with deep notches round the edge, which, to the number of 19 or 20, being fastened parallel to each other on a square axis, were placed in a frame to be drawn by a horse over the field, and the axis, of course, revolving as the horse proceeded, the serrated edges coming in contact with the clods, crushed and broke them as they passed. To assist the operation of the machine, lateral teeth were placed at the angle of each notch, projecting from the side of the disk, the edges of which were in the direction of the radius of the disk itself. This instrument the plaintiff found to be imperfect in two respects. The disks being fastened on a square axle, and all, of course, revolving together in one mass, the result was, that in turning the machine at the head of the field, a dragging took place at each end, by which the young crops, when such were being operated upon, were at that part considerably injured. This difficulty the plaintiff got over by placing the several disks on a circular in place of a square axis. Each revolved, therefore, independently of the other, and of course, in turning on the headland, no dragging motion was produced. Another advantage was that the new machine did not clog like the old. The disks revolving at unequal speed, according to the obstruction they met with in passing over the surface, any clods which might get fixed between them were soon removed by the mere motion of the machine. The second improvement in the patent taken out by the plaintiff was in the position of the lateral teeth. In the old machine these teeth, being placed in the direction of the radius of the disk, the result was, that as the edge of the disk always sunk some way into the ground, these lateral teeth met the clod sideways rather than with the edge, and tended to press it into the earth instead of breaking it. By placing these teeth, not in the line of the radius, but at a certain angle with it, it was found that when the edge of the disk sunk into the soil, the edge of the teeth met the clods perpendicularly, and the operation was much more completely performed. The patent was taken out in September, 1841. Mr. J. A. Ransome, agricultural implement manufacturer, Mr. Josiah Parkes, a member of the Royal Agricultural Society, and other parties, were examined to show the usefulness and novelty of the improvements in the machine of the plaintiff. It appeared, also, from the testimony of several parties who had been in the employment of defendant at his works at Louth, in Lincolnshire, that subsequently to the date of the patent, he had made and sold several clod-crushers, in which the principle of the plaintiff's machine, so far as the revolving disks were concerned, had been pirated. In his clod-crushers the axis was square in the middle, and the disks at that part were fixed to it, but at each end six or seven were moveable, the axis at that part being circular. Mr. Watson, for the defendant, stated that he would adduce evidence to show that the invention claimed by the plaintiff was not new, and called a number of witnesses for that purpose. Several of these were farm servants, employed on a farm belonging to defendant, who stated that in the spring of 1841 a clod-crusher made at the defendant's works was in use on the farm. It was of superior construction, and they observed that it did not tear up the headland in turning. When it became clogged, which from the soil being soft and full of grass it sometimes did, it was cleaned by placing it on the road which ran beside the headland at a higher level, with the end projecting over, clear of the ground, and then each of the six disks from each end revolved, it was found, independently of the others. Some other persons in the employment of defendant, at his works, stated that several such machines had been made previous to the date of the patent, but they could not mention any party to whom they had been sold. Mr. Booth, an engineer at York, stated that in 1824 he was carrying on business at Malton, and that he made a clod-crusher for a Mr. Johnson on the old principle with the square axle. On going to see it work the objection to its mode of turning on the headland was at once apparent, and he had the axle made round at each end, and disks with circular holes made to run upon it. It was, however, badly made, and did not answer. The bosses on the disks at the centre were not made large enough, and the side teeth interfered. The principle, however, was precisely the same with that claimed by the plaintiff. One of these castings, with a hole for a square axis, however, was produced. The witness said that he had none with circular holes; such of those as remained at the works had been broken up. He further stated, on cross-examination, that in 1839 and 1840 he made a model of a similar machine, which he sold to a person of the name of Walker, against whom also the plaintiff was about to bring an action, but who finally gave in to the plaintiff's claim. This model he said was at Malton, but was not produced. Mr. Jacob Brosker, residing in Derbyshire, was called to show that in 1830 he invented a machine for cutting land and breaking clods, in which a number of disks revolved independently of each other on a circular spindle. In this instrument, however, the disks consisted merely of a collar surrounding the spindle, with a number of long teeth projecting eight or ten inches, and could not be employed for the same purposes as the clod-crusher which the plaintiff claimed to have invented. At the close of the case for the defence, the court adjourned at six o'clock until Monday, when plaintiff's counsel replied, and the jury returned a verdict for the plaintiff, with nominal damages to the amount of 40*s*.

Theatricals.

COVENT GARDEN. — After being for some months unocupied, this theatre has been let to M. Laurent, who is well known in this country, from his connexion with various theatrical speculations. It is his intention to commence early in October with promenade concerts, and at Christmas to try dramatic performances and a pantomime. In 1828 M. Laurent was lessee of the Italian Opera House in Paris, at which time he engaged an English company, among the members of which were Kean, Charles Kemble, Liston, and Macready. Subsequently, he became the manager of our Italian Opera, in association with Mr. Laporte. More recently he established promenade concerts in this country. In the present state of theatricals, it is something to notice any effort that may tend to give the unemployed dramatic talent a chance of profitable employment.

SURREY. — Since the recent examination of the extraordinary house in West-street, Smithfield, and the disclosures made relative to the purpose for which it was used, Mr. Leman Rede, the dramatist, has been engaged by the lessee to write a piece for this theatre, under the title of *The Old House in West-street, or London in the Last Century*, in which many characters are brought on the stage representing those grades of society which are supposed to have inhabited the houses of that neighbourhood. The play was submitted for examination, and arrangements were made for its production a few nights ago, when Mrs. Davidge, the lessee of the theatre, received a notice from the Lord Chamberlain to the effect that the piece, in its present shape, could not be performed. The play was consequently withdrawn from the bills and another substituted. It is stated that the grounds upon which the performance was suspended were, that from the locality from which the incidents were drawn, and the depraved habits of the characters thus brought before the audience, its general tendency would be to deprave the public taste.

BIRTHS.—On the 27th ult., at Tunbridge-wells, LADY TEIGNMOUTH, of a son—30th ult., at Swarland Park, the Hon. Mrs. COULSON, of a son—30th ult., Mrs. F. W. STRANACK, of a son—30th ult., at Wandsworth-road, Mrs. R. C. HARVEY, of a daughter—30th ult., Mrs. E. TOULMIN, of St. Ann's-road, North Brixton, of a daughter—31st ult., at Kilburn, the lady of H. NALDER, Esq., of a daughter—31st ult., at Coptfold-hall, Essex, the lady of J. A. HARDCASTLE, Esq., of a daughter—31st ult., at Kingston-on-Thames, the lady of Mr. F. W. PHIPPS, of a son—31st ult., at Hampstead, Mrs. J. G. HOARE, of a son—31st ult., at Laura-place, Clapton, Mrs. F. H. BOWES, of a son—1st inst., in Mortimer-st., Mrs. F. BUSHILL, of a daughter—1st inst., in Devonshire-square, Mrs. D. DARLING, of a son—2d inst., at the Lawn, South Lambeth, the lady of P. J. MUGENS, Esq., of a daughter—2d inst., at Southampton, the lady of W. C. HUMPHRYS, Esq., of a son—2d inst., at Highbury-place, Mrs. W. BETTS, of a daughter—2d inst., at Kidderminster, the Hon. Mrs. CLAUGHTON, of a daughter—2d inst., in Charlotte-street, Bedford square, Mrs. J. ELAM, of a daughter—3d inst., at Woolwich, the lady of Major STRANSHAM, of a still born daughter.

MARRIAGES.—On the 22d ult., at St. John the Evangelist's, Westminster, B. W. HOLT, of 30, Abingdon-street, Westminster, Esq., to SARAH M. DEW, only child of Dyer Dew, Esq., of Walcot-place, Kennington—27th ult., at the Episcopal Chapel, Stirling, Capt. C. T. HILL, of the 29th Reg., Madras Army, to EMMA H. RUSSELL, eldest daughter of G. E. Russell, Esq., late of the Madras Civil Service—27th ult., at St. Pancras New Church, R. J. BARROW, Esq., of Hawley-road, Kentish Town, to SARAH KEYS, third and youngest daughter of the late Capt. C. KEYS, of the East India Company's Bombay Marine, and of Providence-place, Ramsgate—29th ult., at the church of St. Stephen's, Coleman-street, W. E. WADDINGTON, son of J. Waddington, Esq., of London Wall, to JANE MELTON, daughter of the late W. Melton, Esq.

DIED.—Recently, suddenly, S. MAXWELL, Esq., youngest son of the late Rev. P. Maxwell, of Almer Rectory, aged 29—26th ult., A. LITTLE, Esq., of Shabden Park, aged 85—26th ult., deeply regretted by her friends, HANNAH GAVEY, the beloved wife of P. Gavey, Esq., of 22, Great Knight Rider-street, Doctors' Commons—26th ult., at River-terrace, Islington, W. F. BENTLEY, eldest son of Mr. W. Bentley, aged 19—26th ult., at Wratting Park, Cambridgeshire, SIR CHARLES WATSON, Bart., aged 91. This gentleman was created a baronet at eight years old by George II., on account of his father's (Admiral Watson) services, who died of a fever at Calcutta whilst in command of the naval forces in India—26th ult., at Burton Lodge, Hants, Lieutenant-General LORD KEANE, aged 64—26th ult., at Corsham, Wilts, GEORGINA J. MACKIE, fourth daughter of the late Major-General George Mackie, C.B.—27th ult., at his residence, Manor-house, East Ham, Essex, W. S. FRY, Esq., son-in-law of the celebrated Mrs. Fry, aged 39, also on the 3d inst., EMMA E. FRY, eldest daughter of the above W. S. Fry, aged 11—29th ult., at Wilmot-place, Kentish Town, Mr. A. PATTISON, late of Cornhill—30th ult., P. A. LA FARGUE, Esq., of Husbands Bosworth, Leicestershire, Deputy Lieutenant and senior magistrate for the said county, also for many years magistrate for the county of Northampton, aged 75—30th ult., at Tunbridge Wells, after a short illness, J. H. TURNLEY, only son of H. Turnley, Esq., of Bishopsgate-street, aged 21—30th ult., at Guernsey, SIBELLA STIRLING, the wife of Major Stirling, of the Bombay Army, and of Clifton House, Exeter, aged 38—30th ult., at Beckenham, Kent, H. CRACKLOW, Esq., aged 84—30th ult., ROSETTA STIEBEL, second daughter of S. Stiebel, Esq., of 39, Russell-square, aged 17—30th ult., at his residence in Tavistock-place, F. BAILY, Esq., F.R.S., President of the Royal Astronomical Society, aged 71—30th ult., suddenly, at the residence of his son-in-law, R. B. Forman, Esq., Frognal Lodge, Hampstead, J. S. BROOKS, Esq., of John-street, Bedford-row, for 40 years a solicitor of the High Court of Chancery, aged 64—31st ult., after a short illness, ELIZA S. LOCKYER, wife of N. Lockyer, Esq., Mayor of Plymouth, aged 36—1st inst., of rapid consumption, sincerely and affectionately regretted, HARRIET COATES, second daughter of Mr. J. Coates, of Kirby, Essex, and adopted child of Mr. and Mrs. H. Washbourne, of New Bridge-st., Blackfriars, aged 16.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER.—A Married Man aged 43, without incumbrance, who has a thorough knowledge of Pines, Grapes, and gardening in all its branches; can take the management of land or cattle if required, and can have an unexceptionable character from the place he has just left.—Direct to A. B., Messrs. Henderson and Co's., Nurserymen, Pine-apple-place, Edgware-road, London.

AS GARDENER.—A married Man, without incumbrance, a native of Scotland, aged 34; is well acquainted with the cultivation of Pines, Grapes, Melons, and Cucumbers, upon the most approved principles, and has had extensive practice in the Flower-forcing department, as well as a thorough knowledge of Flower and Kitchen Gardening. Highly respectable reference can be given as to character and ability.—Direct to A. B. C., at Mr. Glendinning's Nursery, Chiswick.

AS GARDENER.—A Married Man without incumbrance, aged 40, who perfectly understands all Forcing Departments, Flower and Kitchen Garden; no single-handed place will be accepted.—Direct to S. S., at Mr. B. Muffett's, Farwig, near Bromley, Kent.

AS GARDENER.—A middle-aged married Man, who has a thorough practical knowledge of his business His Wife would not object to the care of a Lodge. No objection to any part of the country. A four years' unexceptionable character.—Direct to E. F., 2, Spencer-terrace, Lower-rd., Islington.

AS GARDENER.—A young Man, aged 30, who thoroughly understands his profession in every department.—Direct to Y. Z., Wandsworth Post-office.

AS GARDENER.—A married Man, without incumbrance, aged 35, who perfectly understands his business in all its various branches. Can have an unexceptionable character.—Direct to X. Y., Mr. Clark, Nursery and Seedsman, New-road, Gravesend, or Mr. H. Chapman, Movern Gardens, Grape and Fruit-grower, Vauxhall.

AS GARDENER.—A single Man, aged 34, who perfectly understands his business; the Vinery, and all kinds of Forcing; Fruit, Kitchen, and Pleasure Gardening. Can be well recommended, having lived in his last place nine years; has no objection to live in the house, if required.—Direct to A. B., care of Kay, Nurseryman, Finchley.

AS GARDENER, in a small family, or Under-Gardener, a respectable young Man, aged 24, who can have nearly 5 years' character from his last situation.—Direct T. W. P., Mr. Privett, Surrey Cottage, Stockwell, Surrey.

TO LANDED PROPRIETORS.

AS LAND STEWARD or MANAGER.—A middle-aged married Man, who has for 12 years had the entire management of one of the largest farms in East Lothian, where he has had the most extensive experience in the breeding and feeding of Stock, and in the draining and cultivation of land, on the most approved principles. The most satisfactory references as to character and thorough practical ability can be given, from his present and late employers, and from several of the most eminent agriculturists in the South of Scotland. The advertiser will be at liberty from his present situation at Michaelmas next.—Direct to J. D., 151, Oxford-street, London.

TO SEEDSMEN AND NURSERYMEN.

A YOUNG MAN of practical experience (for several years) in the London and Country Trade, who has a good knowledge of Plants, and has been used to travel, feeling competent to take a General Management, is desirous of obtaining a Situation in the above line.—Direct to F. F., care of Mr G. Gibbs, Seedsman, Down-street, Piccadilly, London.—N.B. No objection to the Country.

A YOUNG MAN is desirous of obtaining a Situation in a SEED-SHOP. Respectable reference and security can be given.—Direct to A. B., at the Office of this Paper.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

UNIVERSITY COLLEGE, LONDON.—Faculty of Medicine.—Session 1844-45.—The CLASSES will commence on Tuesday, the 1st of October, when Professor COOPER will deliver an INTRODUCTORY LECTURE on the Study of Surgery, at 2 o'clock precisely.

Classes in the order in which Lectures are delivered during the day.

Medicine, Principles and Practice of—Professor Williams, M.D.
Anatomy and Physiology—Professor Sharpey, M.D.
Chemistry—Professor Graham.
Anatomy—Professor Quain.
Comparative Anatomy—Professor Grant, M.D.
Materia Medica and Therapeutics—Professor Thomson, M.D.
Midwifery—Professor Murphy, M.D.
Dental Surgery—Lecturer, Mr. Durancé George.
Surgery—Professor Cooper and Mr. Liston, Professor of Clinical Surgery.
Practical Anatomy.—The pupils will be directed in their studies during several hours daily by Mr. Ellis and Mr. Potter, under the superintendence of Mr. Quain and Dr. Sharpey.

SUMMER TERM.

The following subjects will be taught during the summer term:
Botany—Dr. Lindley.
Midwifery—Dr. Murphy.
Pathological Anatomy—Dr. Walshe.
Comparative Anatomy and Zoology (Elementary Course)—Dr. Grant.
Forensic Medicine—Dr. Thomson.
Practical Chemistry—Mr. Graham.

Hospital Practice daily throughout the year:—
Physicians—Dr. Williams, Dr. Thomson, Dr. Taylor, Dr. Walshe.
Obstetric Physician—Dr. Murphy.
Consulting Surgeon—Mr. Cooper.
Surgeons—Mr. Liston, Mr. Quain.
Assistant Surgeon—Mr. Morton.
Dental Surgeon—Mr. Durancé George.
Medical Clinical Lectures—Dr. Williams and Dr. Thomson, and also by Dr Taylor, Professor of Clinical Medicine, whose special duty it is to train the pupils in the practical study of disease at the bedside during the visits, and also by a series of lectures and examinations on the physical phenomena and diagnosis of disease, to classes consisting of a limited number and meeting at separate hours.
Surgical Clinical Lectures—Mr. Liston, Mr. Quain.
Obstetric Practice under the superintendence of Dr. Murphy.

Prospectuses may be obtained at the office of the College.

Residence of Students.—Several of the Professors, and some of the Masters of the Junior School, receive Students to reside with them; and in the office of the College there is kept a Register of parties unconnected with the College, who receive boarders into their families; among these are several medical gentlemen. The Register will afford information as to terms and other particulars.

The Report of the Distribution of Prizes in the Faculty of Medicine for the past Session, with the Examination Papers, is ready. Former Students of the College may have it forwarded to them on sending their address.

THOMAS GRAHAM, Dean of the Faculty.
CHAS. C. ATKINSON, Secretary to the Council.

August, 1844.

The Lectures to the Classes of the Faculty of Arts commence on the 15th of October.
The Junior School opens on the 24th of September.

LAST FLORAL FETE OF THE SEASON!

ROYAL SURREY ZOOLOGICAL GARDENS, TUESDAY, SEPT. 17th, 1844.—GRAND DAHLIA AND MISCELLANEOUS FLOWER SHOW, for Flowers, Fruit, and Vegetables, combined with the following attractions:—Picturesque Grounds, Superb Menagerie, Gigantic Model of Old London, Blight's Cornopean Brass Band, Model of Venice, Feeding of the Carnivora, Promenade Concerts, introducing Beethoven's Battle Sinfonia, Spohr's "Consecration of Sounds," &c., and Great Fire of London, allowed to be the grandest Pyrotechnic Display ever witnessed. No Establishment in Europe presents so many, varied, and unique attractions.

Admittance 1*s.* Open at One. Conflagration at Eight o'clock

NEW CARNATIONS, PICOTEES, AND PINKS.

MESSRS. N. and B. NORMAN'S CATALOGUE of SHOW VARIETIES can be had on prepaid application.—Bull Fields, Woolwich.

THE ROYAL BOTANIC SOCIETY of LONDON, Incorporated in 1839, for the promotion of Botany in all its branches, and for the formation of an extensive Botanical and Ornamental Garden within the immediate vicinity of the Metropolis, will meet for a PROMENADE in their Garden in the Regent's Park every WEDNESDAY in MAY, JUNE, and JULY, 1845 (weather permitting), excepting those Wednesdays selected for the Exhibitions of Plants, Flowers, &c.

J. DE C. SOWERBY, Secretary.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—The following days being the first WEDNESDAYS in MAY, JUNE, and JULY, 1845, are appointed for the EXHIBITIONS of PLANTS, FLOWERS, &c., in the Garden of this Society in the Regent's Park:—

MAY 7th,
JUNE 4th,
JULY 2d.

But should the Ascot Races be fixed for the first week in June, then the June Exhibition to be on Wednesday, the 11th.

J. DE C. SOWERBY, Secretary.

GRAND DAHLIA SHOW, SEPT. 25, Bazaar, Baker-street, Portman-square, London.—Committee:—Messrs. Widnell, Girling, Brown, Atwell and Brown, Keynes, Harrison, Sorrell, Bragg, Stein, Turner, Whale, Sparrey, Hansard, Edwards, Low, Mitchell. Prospectus, of any of the Committee, and at the Bazaar. Entrance, on or before the 20th. Seedlings to come out in the spring will be shown, six blooms each; Seedlings of the present year, one bloom each. A Dinner will take place at half-past three.

EXHIBITION OF LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London (removed from Walworth), by Appointment FLORIST TO HER MAJESTY, begs to inform the Nobility, Gentry, and Amateurs, that he has above 4000 blossoms of this most beautiful LILY, now in flower, including the rare and splendid variety "Speciosum," which is held in such high estimation by the Japanese. May be viewed every day, Sundays excepted. Admittance, gratis.—Clapham Rise, Sept. 11, 1844.

HURST AND M'MULLEN, 6, Leadenhall-street, beg to inform their Friends that their importations of DUTCH AND CAPE BULBS have just arrived, in very fine condition. Catalogues may be had on application.

"PRINCESS ALICE MAUDE" STRAWBERRY. Plants of this splendid Strawberry, the earliest known, 25*s.* per 100.
Myatt's British Queen, 6*s.* per 100.
Myatt's Deptford Pine, 25*s.* per 100.

PINE-PLANTS.—To be Sold by Auction (if not previously disposed of), at the Gardens, Foxholes, on WEDNESDAY, Sept. 25, at One o'Clock, the entire Stock of PINE-PLANTS, consisting of Montserrat, Providence, and two Seedlings named the "Black Prince" and "Prince Alfred," in all 300 Plants. The Seedlings grow to a great size, and are of good flavour. A Pit of these Seedling Pines in fruit may now be seen at Foxholes, near Rochdale, averaging 8 lbs. weight.—Sept. 12.

THE NEW SUPERB SEEDLING PICOTEE,
"BURROUGHES'S DUKE OF NEWCASTLE."

YOUELL & CO. have much pleasure in announcing they will send out for the first time the above splendid light-edged purple Picotee, raised by the Rev. J. Burroughes. It is guaranteed to surpass any Purple Picotee that has yet been raised. Without commenting further upon its superiority, Y. and Co. beg to refer to a report in a late No. of the *Gardeners' Chronicle*, as follows:—

"The *Duke of Newcastle* is a flower of first-rate properties; it is a light-edged purple; the petals are large, and of good form and substance; even on the edge; the colour unbroken; the pod good, and with less disposition to bar than is common." It obtained the first prize, as the best seedling, at the Norfolk and Norwich Horticultural Exhibition. Price 21*s.* per pair, and will be sent out the latter part of next month. The stock being limited, to prevent disappointment early orders are respectfully requested. Y. & Co. will also be enabled to supply at the same time the following superb Picotees, raised by the same gentleman, all possessing first-rate properties, and having been exhibited and obtained first class prizes at several of the metropolitan Exhibitions of the present year. They are as follows:—

Burroughes's	Mrs. Benyon, Red Picotee	.	7*s.*	6*d.*
"	Lady Alice Peel, Rose Picotee	.	7	6
"	Miss Jane, Purple Picotee	.	7	6
"	Miss Bevan, Red Picotee	.	7	6
"	Enchantress, Scarlet Picotee	.	5	0

CARNATIONS AND PICOTEES.

Y. and Co.'s collection of this beautiful tribe of flowers will be found the most extensive and select in Europe, comprising every known variety of merit. The plants are remarkably strong and healthy, and will be ready for sending out to any part of the United Kingdom and the Continent the latter part of this month, at the following prices:—

				£	*s.*	*d.*
12 pairs extra fine and very superior first-class Show Flowers				2	10	0
25	ditto	ditto	ditto	5	0	0
12	ditto	ditto	Show Flowers	1	10	0
25	ditto	ditto	ditto	3	0	0

The selection being left to Y. and Co.

Great Yarmouth Nursery, Sept. 13, 1844.

RARE AND BEAUTIFUL COLUMBINE, &c.—The Subscribers beg to intimate that they have saved Seeds of a superb variety of Aquilegia glandulosa. This splendid Columbine is a hardy Perennial, and forms one of the most gay border-plants in cultivation; it grows to the height of from 12 to 18 inches, abounding in two-coloured blossoms—blue and white—of the size and shape of the common Passion-flower. Packages of about 150 Seeds are sent free at 1*s.* per packet, or for stamps of that value. The trade can be well supplied with seedling and transplanted native Scotch Firs and Larches. Choice named Carnations, &c.

JOHN GRIGOR and Co., Nurseries, Forres, N.B.

EARLIEST STRAWBERRY in CULTIVATION.—Strong Plants of the "PRINCESS ALICE MAUDE" STRAWBERRY, which has proved itself to be the earliest grown in this country, are now ready to be sent out at 30*s.* per 100. As an Early Strawberry, it has taken the First Prize at all the Horticultural Exhibitions in the early part of the season. Also Plants of the "British Queen," "Deptford Pine," "Prince Albert," and all the leading kinds. To be had of Messrs. WARNER & WARNER, Seedsmen, 28, Cornhill, London.

CARNATIONS AND PICOTEES.

JOHN DICKSON, Acre-lane, Brixton, Surrey, has prepared for the growers of these splendid flowers a Catalogue, enabling them to judge of their qualities, with the prices annexed, which may be had at the Nursery, and of Messrs. WARNER & WARNER, Cornhill, London, after the 7th September.

TO CALCEOLARIA GROWERS.

THE present being a good time to sow CALCEOLARIA SEED, the Advertiser begs to offer a few packets of his splendid New Spotted kinds, saved with great care, with printed directions to raise the young plants, at 5*s.* per packet.—J. STANDISH, Nurseryman, Bagshot.

T. AND J. BACKHOUSE, NURSERY & SEEDSMEN, York, beg to offer to the notice of the Public their following fine SEEDLING PANSIES:—

YORKSHIRE ECLIPSE.—"No. 1 is a large flower, of good form, white ground, blue purple upper petals, and broad margin of the same round the lower petals; the petals meet well above the eye; a good flower." 3*s.* 6*d.*

BEAUTY OF HOLDGATE.—"No. 2 is your best flower; the eye large and intensely dark, ground light buff, belting purple, upper petals the same; a brilliant and striking flower." 3*s.* 6*d.* (See *Gardeners' Chronicle*, p. 280, for 1844.)

EARL OF ZETLAND is a flower of excellent form, yellow ground, bronzy crimson upper petals, with broad belting of the same round the lower petals, which meets well above the eye; a distinct and very constant show flower. 3*s.* 6*d.*

Strong plants are now ready for sending out, postage free when three or more plants are taken. A remittance required from unknown correspondents.

INGA PULCHERRIMA. (Figured in "Paxton's Magazine of Botany" for August, 1844.)—Fine Plants of this extremely elegant and beautiful Exotic, with most of the other new and rare Plants of the season, may be obtained of the undersigned, at the following low prices:—

Inga pulcherrima, 7*s.* 6*d.*	Habrothamnus elegans, 15*s.*
Achimenes picta, 10*s.* 6*d.*	Tremandra Hugelii, 10*s.* 6*d.* to 21*s.*
Æschynanthus Horsfieldii, 7*s* 6*d*	Veronica speciosa, 5*s.* to 15*s.*
Amycia zygomeris, 7*s.* 6*d.*	Erica elegans, fine and healthy, 15*s.*, 24*s.*, and 30*s.* per doz.
Clerodendron splendens, 10*s* 6*d*	Drymonia punctata, 3*s.* 6*d.*
" squamatum, 5*s.*	Phlox Van Houttei, (flowering plants), 2*s.*
Hindsia, or Rondeletia longiflora, 15*s.*	Spirea Reevesiana, 5*s.*
Epacris campanulata rosea (the finest selected from 1000 seedlings), 7*s.* 6*d.*	Viburnum cotonifolium, 3*s.* 6*d.*

Also the following, in collections:

100 Cape Ericas of 100 distinct sorts, (including many fine sorts) 5*l.*	(including Campanulata rosea) 21*s.*
12 Epacrises of 12 distinct sorts,	12 Azalea indica, of 12 distinct sorts, (including fulgens) 21*s.*

THOMAS JACKSON, Kingston Nursery, Surrey, Sept. 13.

SPLENDID NEW SEEDLING CINERARIAS.

MICHAEL BREWER, Sen., begs to return his best thanks to his numerous friends who last season favoured him with their orders, and to apprise them that in addition to his own extensive List of varied Self and party-coloured new and truly splendid Seedlings of the present year, he made purchase of every new advertised and well-described kind, which having propagated and seeded to great extent, he is now prepared to execute orders for strong seedling plants, fit for furnishing to the Greenhouse, through the autumn and winter months, a varied, lively, and continuance of elegant bloom, comprising every shade of deep rich purple, dark and light blue, &c., at 9*s.* per doz., basket, &c. included. Also seed of the same, which he confidently recommends on account of all being grown mixed together. Mixed and collected in packets, 2*s.* 6*d.* each.

Letters, inclosing post-office orders or stamps, will be immediately attended to.—Nursery, London-road, Cambridge.

KINGHORN'S SPLENDID CALCEOLARIAS.—In reply to numerous correspondents, WILLIAM MAY begs to intimate that the Calceolarias he advertised are not the same as advertised by another party, but totally and distinctly different. W. M. having had the choice of the whole collection, he selected five of the most distinct and best varieties, which he purposes sending out in March next, that being the best season for receiving Calceolarias.—Hope Nursery, Bedale, Sept. 12.

ROSES.

A. PAUL AND SON, respectfully announce that their Annual Descriptive ROSE CATALOGUE will be ready for circulation in a few days, and may be obtained from the Nurseries post-free, upon application inclosing two postage stamps. Their stock is very large, and having been grown on new ground, the plants are more than usually robust and healthy. All the really valuable new Roses are in their collection.

TO NOBLEMEN and GENTLEMEN PLANTING.—A. PAUL and SON would also call attention to their Fruit and Forest Trees, Ornamental Trees, Shrubs, Evergreens, &c. &c., which are growing on upwards of 25 acres of ground, and are on sale upon the most reasonable terms. The soil is a stiff loam, from which Trees remove in perfect safety, having abundance of fibrous roots, and the earth adhering thereto. The proximity of the Nurseries to the Metropolis, and the advantageous terms of sale, recommend them especially to gentlemen planting.

Nurseries, Cheshunt, Herts, 13 miles from London, near the Waltham Cross Station on the Cambridge Line of the Eastern Counties Railway.

TRUE HIGHLAND PINE.

JAMES GRIGOR, NURSERYMAN, Norwich, begs to call the attention of the Land Proprietors of England to this very desirable variety of Pinus sylvestris, which has been raised from seeds collected on the mountains of Strathspey, and of which he has strong plants ready to be sent out. For introducing this tree Messrs. GRIGOR, of Forres and Elgin, were awarded several premiums by the Highland and Agricultural Society of Scotland; and in that part of the country this Pine is rapidly superseding the common soft-wooded variety. For all economical purposes its chief merit consists in the hardness and durability of its wood; hence it is much sought after at present for railway sleepers. Pictorially considered, or as a landscape ornament, it rivals even the Cedar of Lebanon. Sir Walter Scott describes it as assuming much of "the bold and contorted figure of the Oak;" and in the last No. of the *Quarterly Review* it is recommended as a fit tree to be planted in churchyards and cemeteries.

Strong plants in pots, such as rabbits and hares will not destroy	6*d.* each.
Ditto, not in pots, 18 inches high	30*s.* per 1000.
Ditto " 15 "	20*s.* "
Ditto " 1 foot high	15*s.* "
Ditto " 3 years old	10*s.* "

J. G. would recommend all who require them to furnish themselves immediately with these Pines, and to plant them forthwith. Spring planting is exceedingly hazardous; and when followed by such a season as was experienced during the commencement of the present summer, the young trees are sure to be killed.

Cedrus Deodara raised in the open ground, being the strongest plants yet offered in England, 10*s.* each. Araucaria imbricata, Pinus excelsa, Laricio, Austriaca, &c. &c. on reasonable terms.

JOHN SLATER, FLORIST, Cheetham Hill, near Manchester, respectfully calls the attention of the Floricultural Public to his large and select collection of the following Florists' Flowers:—TULIPS, AURICULAS, POLYANTHUSES, CARNATIONS, and PICOTEES; catalogues of which may be had on prepaid application. 12 plants of named Auriculas, of different varieties, for 20*s.*, package included. 20 pairs of Carnations and Picotees, good named varieties, for 20*s.*, package included.

NEW PANSY SEED.

WILLIAM CLARK, 25, Bishopsgate-street-within, London, is now sending out the above from the best flowers grown, in papers of 2*s.* 6*d.* and 5*s.* each. Also J. H. Cox, Esq.'s Superb Picotee Seed, 5*s.* per paper; fine Cineraria, Calceolaria, Polyanthus, and Auricula, 1*s.* per paper—may be had on receipt of a post-office order.

ACHIMENES PICTA.

W. J. EPPS begs to announce that he has the largest stock of this valuable Plant, which he can supply strong Plants of at 5*s.* each, or 2*l.* 2*s* per dozen. Also the New and Splendid Buddlea Lindleyana, 5*s.*; Drymonia punctata—strong flowering plants, 5*s.*; Aristolochia gigas, 5*s.*; Clerodendrum lævifolium (a distinct and beautiful variety), 5*s.*; Gloxinia Cartonii, 5*s.* to 7*s.* 6*d.*; G. bicolor, 5*s.*; insignis, 5*s.*; G. magniflora, 5*s.* Strong plants of nearly all the new Fuchsias sent out this year, 15*s.* per dozen.

Bower Nursery, Maidstone, Sept. 12, 1844.

CINERARIA "SILVER QUEEN."

A. PAUL AND SON, NURSERYMEN, &c., Cheshunt, Herts, beg to offer the above novel and beautiful Cineraria, which was exhibited at the Horticultural Society's Rooms, in Regent-street, and awarded a certificate there.

"A singular and handsome seedling Cineraria, showing a disposition to quill, by the purple rays of the flower being drawn together for some distance from their bases, and thus forming a tube having a silvery appearance."—*Gardeners' Chronicle.*

"From Messrs. Paul and Son, of Cheshunt, a Cineraria, doubly quilled, of a lilac or beautiful and singular silvery appearance."—*Gardeners' Gazette.*

Strong Plants now ready, 5*s.* 6*d*, including package, or post free, 6*s.* An order on Waltham Cross post-office expected from unknown correspondents. The usual discount to the Trade when six plants are taken.

DUTCH HYACINTHS.

WARNER AND WARNER, SEEDSMEN, No. 28, Cornhill, London, respectfully inform the Nobility and Gentry their Dutch Flower-roots have arrived in superior condition, consisting of the choicest and newest varieties. The Bulbs are unusually handsome and large, at moderate prices. Catalogues forwarded by post on application.

CAMELLIA "EMPEROR."

T. DAVIES AND Co. beg to inform their friends and the Public, that they now intend sending out the above magnificent Seedling, raised and flowered by them in 1843, when it was exhibited at the rooms of the Horticultural Society of London, where it was awarded a Prize, and afterwards spoken of by Dr. Lindley, in his Report of their Meeting, in the following terms, in the *Chronicle* of 25th March, 1843:—"MESSRS. DAVIES & Co., exhibited a very handsome Seedling Camellia, raised from the seed of C. colvillii, fertilised with the pollen of C. reticulata. In the foliage it resembles the older sorts, but the flower, which is large and well filled up, partakes of the form and colour of its male parent. A certificate was awarded for it." Price from 3*l.* 3*s.* to 4*l.* 4*s.* Stock positively very limited.

CEREUS GRANDIFLORUS RUBRA. This splendid new variety of Cereus was raised by T. D. & Co. in the manner described by Dr. Lindley in the Leading Article of last week's *Chronicle*. The flowers measure 10 inches in diameter, are of a pale-red colour, with a shade of purple in the centre. They expand about 7 o'clock in the evening, and last nearly the whole of the next day, being an advantage over the night-blooming, which generally close early the next morning. Strong plants are now ready for sending out at 10*s.* 6*d.* each. Reference or remittance required from unknown correspondents.—Wavertree Nursery, near Liverpool, 14th Sept., 1844.

MR. LYNE'S NEW SEEDLING GERANIUMS.

WILLIAM E. RENDLE has much pleasure in offering to the Nobility, Amateurs, and Trade the following new varieties of GERANIUMS raised by P. E. Lyne, Esq., the entire stock of which he has succeeded in obtaining.

Lyne's Princess Alice	each	£1	1*s.*
Lyne's White Perfection	"	1	1
Lyne's Imogene	"	1	1
Lyne's King of Saxony	"	1	1
Lyne's Redworth	"	1	1
Lyne's Confidence	"	1	1
Lyne's Sappho	"	1	1

The whole set as above for six guineas. The usual discount to the Trade.

"Princess Alice" has received two seedling prizes in London. "White Perfection," first prize at Torquay, and the Gold Medal at Plymouth. "Imogene" is described in the *Chronicle*, June 24th, 1843. They all possess most desirable properties, and can be highly recommended as being first-rate flowers.

W. E. R. has been induced to offer the above at prices considerably lower than usually obtained for such valuable varieties, in hopes thereby to meet with a more extensive demand. Descriptions can be obtained on application.

Orders will be executed in strict precedence. Plants will be delivered in October next. Reference or remittance required from unknown correspondents. Plants will be added to compensate for carriage.—Union Road Nursery, Plymouth, Sept. 13.

ROSES.

WOODLANDS NURSERY, Maresfield, Near Uckfield, Sussex. W. WOOD & SON have the honour to announce that they are now issuing GRATIS, on application, their newly-arranged CATALOGUE OF ROSES, containing a full and comprehensive description of all the most popular varieties, in addition to the novelties that have appeared this season.

Catalogues may be had at Edinburgh, of Mr. R. T. M'Intosh, 12, Catherine-street. Woodlands, September 13.

T. AND C. LOCKHART, SEEDSMEN and FLORISTS, 156, Cheapside, London, beg to announce that their CATALOGUE OF FLOWER-ROOTS for the present season will be forwarded post-free on application.

GERANIUM "CELESTIAL."

CHANDLER AND SONS, NURSERYMEN, Vauxhall, London, have now ready to send out young plants of their New Geranium "CELESTIAL," which has been so much admired. The flowers being very large, and with a beautiful white throat, it is one of the most conspicuous varieties that has yet been raised. Plants, 10*s.* 6*d.* each.

C. and Sons have also to offer healthy young plants of CAMELLIAS of sorts, with flower-buds, at 30*s.* per dozen; larger plants 42*s.* per dozen; and good plants of the newer sorts 60*s.* per dozen. Also good plants of the best sorts of CHRYSANTHEMUMS, at 12*s.* per dozen; larger plants, 18*s.* per dozen. The package included in the above prices. A remittance or reference for payment in London will be expected from unknown correspondents.

DOUBLE ROMAN and PAPER-WHITE NARCISSUS, 4*s.* per dozen. The above Bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have been just received at A. CORBETT'S, late MR. BARRON'S, Italian and Foreign Warehouse, 18, Pall Mall. Also Dutch Hyacinths, Crocus, Tulips, Anemones, &c. &c. Price Catalogues of which may be had per Post.

ARAUCARIA IMBRICATA.

SPLENDID NEW PINUS.—Fine healthy Plants about 9 inches high, can be had at HURST and M'MULLEN'S Seed-shop, No. 6, Leadenhall-street, London, at 5*l.* per 100.—September 13.

CAMELLIA JAPONICA.

ROBERT LAWSON, Esq., of Tiverton, intends disposing of his stock of Camellias, which he has collected at much expense, and successfully cultivated for many years. They are in the highest state of health, and most abundantly set with blooming buds. Mr. L. disposes of them solely in consequence of their having become too large for his conservatory. They are as follows:—

				£	*s.*	*d.*
Reticulata,	from 7 to 8 feet in height,	a very fine specimen, quite healthy and green		10	10	0
Imbricata,	from 7 to 8 feet in height,	do.		8	8	0
"	" 3 to 4 "			1	10	0
Eximia	" 7 to 8 "	a magnificent plant		7	7	0
Chandlerii	" 6 to 7 "	a fine plant		5	5	0
"	" 3 to 4 "			1	10	0
Lady Hume's Blush	6 to 7 "		fine	4	4	0
Double White	6 "			5	5	0
"	" 5 to 6 "			3	10	0
"	5 "			2	10	0
Invincible (Gray's)	5 to 6 "			3	3	0
Fordii	" 4 to 5 "		very fine	4	4	0
"	" 2 to 3 "			1	1	0
Double Striped	5 to 6 "		fine	2	10	0
Anemoneflora Alba	4 to 5 "			2	10	0
Speciosa	" 4 to 5 "			2	2	0
Woodsii	" 4 "		fine	2	10	0
Warratah	" 4 to 5 "		fine	2	2	0
Florida	" 4 to 5 "			2	10	0
Corralina	" 3 "			1	5	0
Lawsonii	" 2 "		new	1	10	0
Colvillii	" 2 "			0	10	6
Doncklaarii	" 2 "			0	10	6
Insignis	" 6 to 7 "		very fine	2	10	0
Eclipse (Press's)	6 to 7 "			3	3	0

The Prices affixed are for the separate plants, of which not less than 8 can be taken together. If the whole are taken in one lot a considerable reduction will be made. Mr. Lawson will be happy to show them, or give any further particulars that may be required.—Tiverton, Sept. 12th, 1844.

HYACINTHS AND OTHER DUTCH BULBS.

CLARKE & CO. beg to intimate to their Friends and the Public, they have just received their annual supply of the above roots, direct from the first-rate growers in Haarlem.—Catalogues may be had, post free, which will be found to comprise every novelty of the season. London, 86, High-st., Boro'. Sept. 13,

BRACONDALE HORTICULTURAL ESTABLISHMENT.

JOHN BELL begs to inform his Friends and the Public, he has just received his Importation of DUTCH HYACINTHS AND OTHER BULBS, direct from Haarlem. Catalogues of which may be had at the Nursery, or his Seed Warehouse, 3, Exchange-street, Norwich.

SEEDLING FUCHSIA "NORFOLK HERO."

JAMES BARKWAY respectfully begs to call the attention of Amateurs and others to the above splendid Fuchsia; it has been pronounced by all that have seen it to be the best light one yet out. See Dr. LINDLEY'S opinion in the *Gardeners' Chronicle* July 18th:—"*J. B.*—Your seedling is a finely-formed flower; tube and sepals of the most delicate pink, approaching to white; corolla rose, with a slight tinge of purple; a clear and brilliant flower; the best of its class we have yet seen." Also, August 10th, when sent with five other seedlings,—"No. 3 is the best in form." It obtained a prize at the Norfolk and Norwich Horticultural Show, as a seedling, July 31.

Plants of the above-named are now ready at 7*s.* 6*d.*; strong plants, with three or four side-shoots, 10*s.* 6*d.* each, carriage, &c. included, if sent by post or otherwise.

J. B. has been very successful in raising Seedling Calceolarias, of which see Dr. LINDLEY'S opinion June 5th and August 10th, of which price, &c. will be given when ready to send out.—East Dereham, Norfolk.

F. C. BALL, successor to Mr. JOHN YOUNG, NURSERYMAN, Taunton, begs to offer 20 or more varieties of IXIAS at 4*s.* per dozen. A List of Ixias and other bulbs will be forwarded on application. An allowance to the Trade. Fine Plants of Gesneria zebrina at 1*s.* 6*d.* each.—Sept. 12, 1844.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

THE following Articles, manufactured in Slate for Horticultural purposes, may be seen in use at Worton Cottage, upon application to the gardener (Sundays excepted).

Tank Covers	Bottoms for Frames
Cisterns	Boxes for Balconies and Verandahs
Sheives	Orange Tubs, Flower Boxes, &c.
Garden Edging	

EDWARD BECK will be happy to answer any inquiries, either personally or by post.

HYACINTHS, IRISES, ANEMONES, &c.

SUTTON AND SONS respectfully recommend the readers of the *Gardeners' Chronicle* to observe their List of Prices, published in the 2nd page of the *Chronicle* for this day. J. S. and SONS consider their Collections of IRISES, HYACINTHS, and ANEMONES, which they have imported this season, to be fully equal to any in Europe; and the prices will be found remarkably low. Descriptive Catalogues (as recommended by Dr. LINDLEY in last week's *Chronicle*) may now be had gratis at their Seed shop, 7 and 8, Market place, Reading, Berks.—N.B. Parcels delivered free to the Railway and Packet Offices in London, or any Station of the Great Western Railway within 60 miles of London.

SMITH'S FIELD and GARDEN SEED-DIBBLE, or HAND-MACHINE, for depositing all kinds of Seed on the various Soils, with the greatest accuracy and despatch. This Machine is so simple in its construction and operation as not to be liable to get out of order, and can be used by men or women. It is easily set, so as to deliver the exact quantity of seed intended to be planted, into each hole made by the Dibble, at one operation, without any further care than supplying it with Seed, by the person using it, and will plant Turnip and Mangold Wurzel Seed, Wheat, Barley, Peas, and all kinds of Garden Seeds. In Tin, 1*l.* 10*s.* each; or with Copper Box and Tube, 1*l.* 15*s.* each. Commission allowed to Agents.

These Dibbles may be obtained of Messrs. COTTAM and HALLEN, 2, Winsley-st., Oxford-st., London, through the agency of the principal Agricultural Implement Sellers in the United Kingdom; or from the Inventor, by letter, to his address, inclosing a Post-office order for the amount.—RICHARD SMITH, Upper Hall, near Droitwich, Worcestershire.

HOTHOUSES, CONSERVATORIES, &c., made and fixed Complete in all parts of the Kingdom. One, two, and three-light Cucumber and Melon-Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from 1*l.* 8*s.* Garden-Lights made and glazed from 1*s.* per foot, at JAS. WATTS' Sash Manufactory, Claremont-place, Old Kent-road. *** Reference given.

TO GENTLEMEN, BUILDERS, NURSERYMEN, & OTHERS

MESSRS. PROTHEROE AND MORRIS are instructed to Sell by Public Auction (under a bill of sale), on the premises, Sussex Nursery, Loughboro'-road, Brixton-road, on Monday, 30th September, 1844, at eleven o'clock, the whole of the NURSERY STOCK, consisting in choice Evergreens and Flowering Shrubs, Standard and Dwarf Roses, also two newly-erected Greenhouses, Frames, about 2000 Greenhouse Plants, a quantity of Rock Work, Utensils in Trade, &c., may be viewed prior to the sale. Catalogues may be had on the premises, of the principal Seedsmen, and of the Auctioneers, Leytonstone.

FREEHOLD NURSERY-GROUND, ST. ALBAN'S, HERTS

MESSRS. PROTHEROE & MORRIS have received instructions from the Executors of the late Mr. Robert Fullwood, the mortgagee, to submit to public competition at the Auction Mart, Bartholomew-lane, on Thursday, 17th October, 1844, at One o'clock, THE KEY FIELD NURSERY AND NURSERY PREMISES, adjoining the town of St. Alban's, comprising a comfortable and convenient Dwelling-house and Shop fronting the High Road from St. Alban's to London, and about six acres of very productive Nursery and Garden Ground. The whole Freehold and Land-Tax redeemed, and immediate possession may be had. The Premises were late in the occupation of Mr. David Watson, who for many years and up to the period of his death carried on the business of a Nursery and Seedsman. May be viewed at any time, and particulars had at the principal Inns in the neighbourhood, at the Auction Mart, of J. S. Story, Esq. Solicitor, St. Alban's; of George Drew, Esq., 185, Bermondsey-street, Borough; and of the Auctioneers, Leytonstone, Essex.

BUNNEY'S FINAL SALE.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by the Proprietor (in consequence of the Lease having expired), to submit to Public Competition by Auction, on the Premises, Kingsland Nursery, Balls Pond-road, on MONDAY, Oct. 7, 1844, and following days, at Eleven o'Clock each day without reserve, the whole of the valuable NURSERY STOCK, consisting of FRUIT and FOREST-TREES, a considerable quantity of EVERGREENS, AMERICAN PLANTS, STOOLS, &c. The Stock is particularly worthy the attention of Noblemen and Gentlemen laying out their Grounds; also the Trade, from its excellence, and comprising an excellent collection of Ghent AZALEAS, MAGNOLIAS, RHODODENDRONS, &c. May be viewed prior to Sale. Catalogues may be had on the Premises, of the principal Seedsmen, and of the Auctioneers, Leytonstone.

MANSION, MANORS, AND ESTATE, IN KENT, TO BE LET,

MAYTHAM HALL, near Rolvenden, ten miles from the Staplehurst Station, on the London and Dover Railway, and two miles from the Tenterden Station on the projected Rye and Hastings Branch.

The MANSION, with beautiful Pleasure Grounds, productive Gardens, Pinery with Vines, Melon and Forcing Ground, Fruit Walls, and extensive Orchard, is delightfully situate in a finely timbered Park, commanding most extensive and highly picturesque prospects.

The MANORS, comprising from 1500 to 2000 acres, have been strictly preserved for many years past, and not having been much shot over last season, are now well stocked with pheasants, partridges, hares, and rabbits.

The MANSION is elegantly furnished, and adapted for a nobleman or gentleman of opulence, and is capable of accommodating a numerous establishment.

A tenant may be accommodated in a short time with any quantity of land he may desire.

May be viewed with tickets only, which, with particulars, may be had of Mr. P. R. DEARDEN, Solicitor, Birkenhead.

BICKLEY PARK MANSION, BROMLEY, KENT.

IMPORTANT SALE.

MR. SEPPINGS is again honoured with Instructions from the Proprietor to proclaim, by Advertisement, that he will SELL BY PUBLIC AUCTION, upon the PREMISES (in consequence of the Mansion being let), on MONDAY, SEPTEMBER 16th, 1844, and Five following days, at 11 for 12 o'clock precisely each day, some splendid Oil Paintings by Lee, valuable Engravings and Prints, excellent Bed and Table Linen, costly and substantial Furniture, a Patent Grand Piano-forte by Broadwood and Sons, a variety of Cut and Plain Glass, Dinner, Tea, and Coffee Services, Kitchen requisites, &c. &c., a large and choice Collection of Greenhouse and other Plants, consisting of very fine specimens of Camellias, Ericas, Cactus, Azaleas, Cactus, Bed of Tulips, and a variety of other rare Plants, with a large Assortment of Flower-pots, Garden utensils, Hand-glasses of various sizes, Cucumber-frames, with Lights, &c. Late the property of John Wells, Esq.

Cards of permission to view the Property, and Descriptive Catalogues, may be had by personal application, or by letter, postage-free, on the Wednesday, Thursday, and Friday previous to the Sale, of Mr. Pawley, White Hart Hotel, and Mr. Baxter, Druggist, Bromley; at Mr. Hitchcock's, Gray's-Inn Coffee-House, Holborn, London; at the Offices of Messrs. SEPPINGS AND JONES, 1 Exchange-street, Norwich; and at the Terrace, Swaffham, Norfolk.

RAY SOCIETY, instituted 2d February, 1844.—This Society has been formed upon the principle of the Parker, Camden, Sydenham, and other Societies, for the purpose of securing to those attached to the study of Natural History, such Works on the various branches of Zoology and Botany as could not be obtained by other means; and will consist of original works; of new editions of works of established merit; of rare tracts and MSS.; and of translations and reprints of foreign works. Every subscriber of one guinea annually will be considered a member of the Society, and will be entitled to a copy of every work published by the Society. The Council have great pleasure in stating that the number of Members already exceeds 300, and beg to call the attention of their friends to the necessity of sending in their names as early as possible, in order that they may be enabled to determine the number of copies of their works which they ought to print. The Council hope to publish two volumes before Christmas, the first of which will consist of translations from the German and Italian, of Reports on the progress of Zoology and Botany during the last few years.

Communications on the business of the Society are requested to be addressed to the Secretaries, Dr. George Johnston, Berwick-upon-Tweed, and Dr. Lankester, Golden-square, London. Subscriptions to be sent, by post-office order or check, to the Treasurer, J. S. Bowerbank, Esq., 45, Park-street, Islington.

GEORGE JOHNSTONE, M.D.
EDWIN LANKESTER, M.D. } Secretaries.

The Gardeners' Chronicle.

SATURDAY, SEPTEMBER 14, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

TUESDAY, Sept. 17 South London Floricultural . 1 P.M.
SATURDAY, Sept. 20 Royal Botanic . . . 4 P.M.
COUNTRY SHOW.—TUESDAY, Sept. 17 . Midhurst Horticultural.

FIFTEEN pounds and a quarter avoirdupois was the WEIGHT OF A PROVIDENCE PINE-APPLE presented to Her Majesty the other day by the Baroness de Rothschild; fourteen pounds and a quarter was the weight of another exhibited by this lady's gardener to the Horticultural Society; eleven pounds eight ounces was that of a third; and two others, each weighing ten pounds and three quarters, were cut green, and sent to France. Supposing that each of the latter would have gained only four ounces in weight (and it would be more reasonable to assume that they would have weighed one pound four ounces more), we have the incredible fact of five Pine-apples weighing sixty-three pounds.

This extraordinary result has been obtained by Mr. George Mills, so well known for his great success in Cucumber-growing; and his name is thus imperishably connected with the history of Horticulture, whose annals record no such event in former days. We have heard, indeed, of thirteen-and-a-half pounds having been the weight of one single Pine; but who before could boast of five huge Pines at one cutting, the lightest of which is almost without a parallel? Let it be remembered, too, that these were no monsters, half-green and half-ripe, with a swelling on one side and a paralytic affection on the other,—with one pound of stalk and two pounds of gills and crown—but honest thoroughly well-grown fruit, with all the parts well-proportioned, and a skin so full of juice, that the pips were puffed and swollen with its enormous accumulation.

And how has this been done? By disrooting and re-rooting? By shifting and re-shifting? By coaxing the unhappy plants to grow, and then cutting off their means of existence? By potting and repotting, and potting again? By skinning a rich old pasture and carting the fee-simple of an acre into the potting-shed? By the aid of succession-pits, and succession-houses, and fruiting-houses? Of steam, hot-water pipes, or tanks? Of an apparatus, which no one without the revenues of a Rothschild could dare to think about? Not at all. By no such appliances; by nothing more important than a pigeon-holed Cucumber-pit, peat, and GOOD GARDENING. By what, in fact, every farmer can command, except the last; and that, it must be confessed, is rather important.

Without pretending to be better informed than our neighbours, or to have access to information which is not current all round the neighbourhood of Madame de Rothschild's residence, we will undertake to say that the following is very nearly the plan pursued by Mr. Mills. Conceive a sunk brick-pit, some eleven feet long and three feet wide, built of 4-inch brick-work, and pigeon-holed for three or four courses at the bottom. Let this be covered with common Cucumber sashes, and surrounded by hot dung. Then let us suppose that rough faggots or the larger boughs of trees are thrown into the bottom of such a pit to the depth of a foot, over which peat is laid to the same thickness. And now all being ready, suppose that a healthy sucker of a Pine is planted in this soil under the centre of each Cucumber light, and, unless we are much mistaken, we have the whole of Mr. Mills's preparation, except the good gardening, which neither bricks, nor faggots, nor soil, nor heating materials, can form, however much they may assist it.

Let not our country readers be incredulous about all this. What we have seen with our own eyes we may venture upon recording; and yet we should be disposed to pardon those who, in the face of such a statement, should exclaim, "I would not believe that, not even though I saw it myself;" for it does seem impossible to those who have been accustomed to ordinary Pine cultivation. We shall, however, surprise them still more when we add, that we are not yet satisfied. Great as Mr. Mills's success has been—and too much honour cannot be given to him for it—it is not great enough. Pines may be grown still larger and better; and we shall never rest contented till we see a Providence weighing 20 lbs. Then, and then only, shall we believe that growing Pine-apples will go no further.

Now that the HYACINTH SEASON is at hand, it is as well to remind our readers what they are to do in order to obtain good flowers.

Pick firm, plump bulbs, as round as may be. These are always the soundest, and are not likely to damp off.

When they are placed in glasses, take care that the water does not come within one inch of the bulb; put them in a dark closet that is rather warm, or, which is better, wrap them all over the glass and bulb, with old flannel, and keep them in a warm place till the roots are an inch long at least. Some recommend that the glasses should be dark; but that is of little consequence, provided the place in which the bulbs are set to root is dark.

The reason for this very important rule is, that roots should always be formed before leaves; otherwise, when the latter begin to grow they have nothing to feed them. Nature is most careful about this, as we may see when a seed begins to germinate and a tree begins to fruit. But ignorant people pop their bulbs at once into a glass of water, place it in a window, or upon a mantel-shelf, where light has free access, and the consequence is, that roots, which abhor light, will not come, while leaves, who love the light, rush forward to enjoy it. Then follows a long cluster of foliage, and a top-heavy plant, which when it does flower, if it ever gets so far, topples over every time it is jarred or disturbed. Get plenty of roots first, and leaves and flowers will take care of themselves.

The reason why the water should not touch the bulbs is, that if the plant is slow in growing, the organisable matter of the bulb is distended with fluid before it can decompose it, and so becomes putrid, when it communicates disease in all directions by virtue of its contagious properties. On the contrary, if the roots are active, and the leaves are beginning to grow, what water is taken up is immediately converted into some of the matter that Hyacinths feed on.

After roots have made a fair appearance water may be allowed to reach their tips, but not sooner, and it is only when the leaves are green and unfolding that it should be permitted to touch the bulb.

At that time, that is to say when the leaves are green, a lump of charcoal as large as an egg may be advantageously dropped into the water. It will prevent the water becoming putrid, and will, besides, act as a manure.

None of these precautions can, however, be of any avail unless the Hyacinths are kept close to the light continually, from the time when the leaves are first turned green. Thus, and thus only, will a healthy growth be preserved, and a fine vigorous head of flowers insured. Above all things, too, be careful to make the plants grow as slowly as possible at first, so as to accumulate vigour against the blooming season.

ENTOMOLOGY.

SURFACE-GRUBS and *surface-caterpillars* are terms applied by gardeners to the larvæ of several night-flying moths, and amongst them are Noctua (Agrotis) exclamationis, and N. segetum, which bear the English appellations of the Heart and Dart, and the Common Dart moths, amongst collectors. As these caterpillars have made their appearance in great force in many parts of the kingdom, and numerous inquiries have been made respecting them, I lose no time in addressing the cultivator upon the subject, hoping that by calling his attention to their economy, his efforts to check their ravages may be successfully directed.

All the caterpillars called surface-grubs are exceedingly destructive to various crops, both in the field and garden, frequently devastating entire fields of Turnips and Mangold Wurzel, and not sparing the Potatoes. The larvæ first attack the Turnips in July, and destroy the plants by eating off the crown (fig. 2); in the two following months they sometimes swarm in fields, eating into the bulbs, and rendering them, to a great extent, unfit for use. I have known the Mangold Wurzel suffer severely in June, from these caterpillars biting through the roots, just below the surface of the soil; and they will attack the Potatoes when first pushing out of the ground. At night I believe they sally forth to feed upon the leaves, and after detaching them they are often dragged to their burrows, which resemble those of the earth-worm, and being drawn in, they are enabled to feed in security, and protected from the rays of the sun during the day—for they shun both light and heat. Having decapitated one young plant, the caterpillar directs his course to another with extraordinary rapidity, and thus destroys many more than he can consume for food. Later in the year, when the Turnip crop is more advanced, multitudes congregate round the plants, 10 or 12 being sometimes found about a single bulb.

The Surface Caterpillars transmitted to me this summer from many different localities were those of the Noctua exclamationis and N. segetum, which are equally mischievous, and very similar in appearance; they walk very fast, curl themselves up when disturbed, but speedily become active again, and bury themselves in a few seconds. Where the eggs of N. exclamationis are laid has not been recorded, but it is stated that the moth of N. segetum deposits hers in the earth. The caterpillar of the former is somewhat cylindrical, but a little depressed above, having six pectoral, eight abdominal, and two anal feet; it is of a dull lilac colour, with a broad paler stripe down the back, the margins of which form a darker line along each side, and there is a double dorsal line extending the whole length; the head is horny and brown; the minute eyes and two curved lines, as well as the jaws, are black; the first thoracic segment is rather horny and dotted; the following segments have four little tubercles on each, producing hairs, as well as similar ones on the sides; the stigma black (fig. 1). When full fed it is an inch and a half in length, and buries itself, forming an oval cell of earth, in which it changes to a shining rust-coloured chrysalis (fig. 3) to pass the winter in, and the following June, or perhaps earlier, the moth hatches. By Linnæus it was named Noctua exclamationis, and is now a member of that vast family, but called Agrotis,* and by English collectors the Heart and Dart moth. It is of a clay-colour, the wings reposing horizontally (fig. 4); the horns are like bristles, but slightly pectinated in the males; the tongue is long; on the front of the thorax is a transverse dark patch; on the upper wings there are two waved lines near the base; to the second is attached a long, longitudinal, deep-brown streak; above it is a spot varying in size and form, and beyond it a large kidney-shaped one; then follow a transverse, pale, waved line; and near the cilia is a more irregular one; the under wings are white, the upper margin and nervures brown; but in the female these wings are entirely dark-brown; their expanse is $1\frac{3}{4}$ inch.

The caterpillar of A. segetum is more cylindrical than the foregoing species; the sides are greener, and there are three black dots by the stigma; but for the present I must refer the reader to the "Royal Agricultural Journal" for figures and descriptions of this species.†

It has been pretty well ascertained that salt and water will drive away these caterpillars; lime-water, and an infusion of Tobacco, are also distasteful to them. It appears that soot would be a great protection to Turnips and Cabbage crops, if applied early in the year, and laid an inch thick on the surface. If 1 lb. of soap be dissolved in 16 gallons of soft water, and applied warm to the infested ground, especially round the roots, the Surface Caterpillars will dart out of their burrows, and may thus be readily collected; but no time must be lost, as they will retire under-ground as soon as its effects have subsided. Hand-picking is also unquestionably the most effective means of ridding a field of this pest; it may be carried into effect either at night, when they come out to feed, or by day they may be searched for under stones and clods, and if the earth be scraped away from the bulbs, multitudes will be discovered in an infested field. Ducks and poultry would also assist in reducing their numbers. The pupæ are so securely protected in their tombs that it is perhaps impossible to assail them, and any means of attracting the moths at night by fires, by old sugar hogsheads, or boards smeared with beer and sugar, although it might tend to the capture and destruction of vast numbers, yet it would effect little, it is to be feared, as the males alone would thus fall a sacrifice, the females remaining, with few exceptions, in obscurity.—*Ruricola.*

ROSE GARDEN.—No. XVIII.

(*Continued from page* 604.)

Planting Out.—Having thus brought our subject to a close, as to the operative part, in preparing and perfecting the tree, it may not be amiss to spend a few moments in the consideration of the effect expected to be produced by it when planted out.

There are three causes of beauty in a tree—shape, foliage, and flowers. Shape (to a certain degree) is artificially obtained, foliage and flowers must depend upon species; the foliage is the more permanent, the flower the more striking. Planting out, then, must depend entirely upon the effect desired, and the taste of the party planting, as to variety of foliage, height, flower, its colour, and continuity; a tree with rambling shoots suits one place, and with a cauliflower head another. Tree Roses never look well in a round clump; they must

* Curtis's Brit. Ent., fol. and pl., 165. † Vol. iv. p. 106, pl. G.

have a single appearance or be in some sort of line. If the effect of a sloping bank of Roses be desired, they must be planted in successive heights, viz. each under each; but if they are to have a less forced and regular appearance, and a more single and light look, an intermediate height may be left out, as thus: a two feet in front of a three feet, &c.

Be it observed, that a three-feet standard is most in keeping with the head it carries, and being nearer the ground has a very natural appearance, and in confined places is unquestionably the most desirable; but if the tree is to be distant from the eye, or the shrubbery or walk be large and increasing in distance, a four-feet standard is certainly more distinguishable, and has a much greater effect. A foot standard is of little or no use, except it be intended to approach the edge of a border, or is grafted for the convenience of affording nosegays, or increasing the quantity of the plant placed upon it. The heights most in use having been shown, it may be remarked, that for a weeping Rose to stand singly (perhaps surrounded with a wire guard and creepers upon it, to have a more marked effect), no stem can be found too high, if it be proportionally strong. A fine plant of this sort, six, seven, or even eight feet high, budded with a Noisette, or Boursault, looks beautiful, and its long free branches, covered with clusters of Roses, have a wild and luxuriant appearance, which give it a distinct and peculiar character. The trees being planted out and the earth made good around them, each tree must be supported by a neat clean hazel stake (unless the stock be so strong as not to require it), the top of which should be sawn off exactly level with the top of the wild stem, which conveys a great air of neatness, and attached to it with a piece of bass, or a small strip of pitched rope, which is still more durable.

Observations.—The following may be considered a more entertaining and less slovenly mode of propagating the Rose, as well as having the advantage of economy, as the cuttings of the pruned trees, which would otherwise be lost, are made use of. It must be remembered, however, that it should only be practised upon free, well-rooted stocks, as otherwise the delay in the rising of the sap, and the uncertainty of the supply, frequently defeat the purpose. Grafting, therefore, should succeed budding on the same stock, not precede it; as a bud failing on the stock, if the branch be not destroyed while the sap is up, leaves the stock still vigorous in the ground; if therefore this mode be preferred, it should be practised upon stocks that have had a spring to root themselves. The points to be desired are, that the barks of scion and stock should be cut quite smooth, and not separated from the wood they grow upon—that neither should be bruised—when they are put together should fit close—a supply of sap should commence as soon as possible—that all sun, wind, and rain should be kept from the wound till healed, and that no ligament should be removed, nor shake given to the parts newly placed in contact, till they are perfectly healed; as any jar to the scion when placed is likely to defeat the purpose.

Home Correspondence.

Summer Pruning of the Vine.—In many places where I have visited of late, I have been surprised to see, generally speaking, such a total neglect in the summer pruning of this most generous of all our exotic fruits; it being, as it ought to be, well understood that, by kind treatment, there is no fruit-tree requiring artificial cultivation, the Peach-tree excepted, that will more easily bend to the will of the operator, nor produce more uniform crops of fruit. From the many articles that have appeared from time to time in the *Chronicle*, as well as in books treating exclusively on the culture of the Vine, I am surprised that the work of reformation has not commenced. Amateurs complain that year after year, even at a great expense for fuel, &c., they are never able to produce more than five, six, or seven bunches of Grapes upon each Vine, and of these, three or four bunches are at the extremity or top of the house, two or three in the middle, and the rest of the Vine is totally barren. The question that suggests itself to the mind of a practical man, on entering the houses of amateurs is, Why is each Vine allowed, as it were, to vie with its fellow in luxuriance, and to expend its strength, that ought to have been stored up in order to throw it into fruitfulness?—which no doubt every one would desire, but which it is quite clear is never attained; indeed, they have much the appearance of Vines planted out against some rustic seat, where they are allowed to ramble and luxuriate for the sake of displaying their foliage and tendrils. In some places where there is a scanty scattering of ill-ripened fruit, you find many of the spurs have never been stopped, but are allowed to run perhaps to the length of four feet; these again are loaded with laterals running right and left; others that have been stopped have in many cases sent out a host of laterals, each vying with the other in vigour similar to the common Hop in a hedge-row. If the question was asked, Why such is allowed to be the case? the answer is, "Oh, they are always the same; they are not good kinds; they never bear fruit, therefore we do not think that it is worth while spending time over them; at winter pruning we cut them well in, but they are still as you see, unfruitful. From such neglect it is clear that not one year in ten do they ripen their wood, from want of summer pruning. I would recommend instant application in removing all laterals and tendrils, not at one fell sweep (or the remedy might prove as bad as the disease), but by taking away a few each day, and in the course of a fortnight the Vines could be brought into a better state as regards the more perfectly ripening the wood, without which all labour will prove of no avail. Further, when the wood assumes a russet-brown, or approaches ripening, I would by all means recommend disbudding, as mentioned in my Treatise on the Vine, an operation ever attended with the best results, to Vines of any age, and one, in my opinion, that does not receive the attention which is due to it. If Vines are grown on the long rod system, leaving the eyes 18 or 20 inches apart on each side of the shoot, and all laterals have not been previously removed from each eye, but stopped at one joint, you will there find an eye upon each of them, which take out, leaving the leaves uninjured, with the exception of one or two at the extremity of the shoot. With regard to the spur system, choose a bold eye, third or fourth from the base of the spur, cutting all the others out above and below, with the exception of one well placed at the base, which must be retained in order to produce wood for the following year. I consider a fruitful eye on the Vine as easy to discern as a blossom-bud from a wood-bud on the Peach. A fruitful eye is round, plump, and well filled at the base of the leaf, whereas an unfruitful one is long and pointed. If the above hints were more generally practised by amateurs, they would have less cause to complain; for, by the above treatment (the roots in a proper state) they would be gladdened with more uniform crops of fruit annually, extending from below the angle of the rafter to the extremity of the Vine.—*James Roberts, Hampsthwaite, Harrowgate.*

The Robin.—In May last (see p. 335) I communicated some curious facts connected with the natural history of the robin—a bird to whose remarkable peculiarities, both in a wild and tame state, I have paid particular attention for the last six years. The anecdote I related to you, although authenticated by my name and address, has, I find, been by some doubted, by others marvelled at; nor is this, to me, a matter of surprise, for I verily believe the robin whose merits I record may justly rank as one of the wonders of the world. When last I addressed you my little friend was, as I mentioned, a denizen of the fields, the woods, and the orchards. Free as air he was roaming about with his fond mate and thriving young family (four in number), into whose infantine minds he was doubtless busily instilling a course of sound elementary instruction. These lectures have now terminated. His children, grown up, are gone abroad to see the world, and his ladye-love (as is the custom with these feathered songsters) has taken the veil for six long months. The consequence is, as I anticipated, a *réunion* between myself and this bird of song. No longer afraid, from prudential motives, of venturing too near the habitation of man, he re-appeared on Thursday, the 5th inst., *in propriâ personâ*, an independent, fearless bird. The friend and associate of my leisure moments (for I rise regularly at 5 A.M., to attend to my feathered family), he now comes at my call, however distant he may be. He sits on my finger and on the bridge of my nose, as of old; eats from my hand; sings like a seraph as he runs along the ground, and even allows me to play with him in my open hand, as he lies upon his back! In justice to my *protegé* I must add that his plumage is exquisitely bright, his eye beaming with intelligence, and his whole demeanour noble. Have we not here a convincing proof of the retentive memory, peculiar instinct, and remarkable affection of the robin?—*William Kidd, New-road, Hammersmith.*

Mulberry-tree.—On taking up a Broccoli plant that was recently planted, and which had sustained injury, I found a leaf-stem that had been half broken through, and the fractured part buried in the earth had sent out rootlets. It has been my practice in dibbling Rape plants to coil lengthy stems, which have always struck out roots at the bends. In planting out Cabbage with long stems I have niched them in two or three places, with the same result. M. De Candolle observes in his "Organographie Végétale," vol. i. p. 246, "Une seconde circonstance, qui a engagé les naturalistes à admettre la prétendue identité des racines et des tiges, c'est la facilité avec laquelle l'un de ces organes donne naissance à l'autre." "Si l'on fait une ligature ou une incision à l'écorce d'un arbre il se forme au-dessus d'elle un bourrelet; si l'on enveloppe celui-ci de terre et de mousse humide il y pousse des racines."—"A second circumstance which has induced naturalists to admit of the supposed identity of the root with the stem is the ease with which one of these organs may be made to give being to the other." "If we attach a ligature or make an incision in the bark of a tree, a lump forms above it, and if this is surrounded with moist earth and moss it will send out roots." I imagine, therefore, that if the "Inquirer," (see p. 523,) who has a fine Mulberry tree upwards of 200 years old, is satisfied with its present locality, he may save himself the expense, labour, and risk of raising it, by making incisions in the stem in the part which will be below his new level; the communication of the leaf-roots being thus cut off from the tree-root will, attracted by the moisture of the new soil, strike into it, and the stem will thus send out lateral roots to seek any benefits that may be derived from proximity to the surface, while the original root will continue to draw water from below.—*John Goodiff, Granard.*

Song Birds.—I observe, with admiration, the humane remarks, thrice repeated, of your worthy correspondent, "J. M.," on the subject of wanton cruelty to birds. Too true it is that many hundreds of our choicest, prettiest warblers fall victims at this season of the year to the gun of the savage-breasted Cockney, or to the niggard parsimony of those heartless individuals who grudge the appropriation of a little paltry fruit, in return for the outpouring of hearts full of melody, gratitude, and love. Unfortunately I am myself among those who suffer from this devastation by beardless boys and Cockney sportsmen; but I am not altogether without a remedy; and this remedy I suggest to the notice of your correspondent "J. M." Let him, as I do, keep some choice blackbirds, thrushes, and other varieties of birds, in large, capacious cages (for confinement should not be made punishment) and let him hang them on the walls and trees of his garden. The song of these warblers will assuredly attract others; and by these means he may concentrate all the harmony of the feathered tribe in his own immediate locality, thereby protecting them from the danger of random shots, and from the cruel manœuvres of bird-catchers, bird-haters, and other similar "varmint," as "J. M.'s" enemy, the gamekeeper, has it. When thus assembled, the birds will come regularly to be fed on fruit, seed, bread-crumbs, or berries, and they will never stray further than is necessary for their further supplies of food. I am one of the true Waterton family; I never hear the report of a gun in the winter season but it goes to my heart. It is not a sufficient argument for me to be told that a man or a boy is a bad shot. By their want of skill their victims are too often maimed, when death would have been a blessing. Scandalous is it that humanity should be thus outraged, and that God's lovely and loving creatures should be thus wantonly deprived of their lawful, innocent enjoyment of life, to gratify the worst feelings of which human nature is susceptible.—*William Kidd, New-road, Hammersmith.*

Pruning Forest Trees.—From time to time articles have appeared in your columns, from the pens of various correspondents, advocating what I still call the pernicious and absurd practice of pruning forest-trees. I call it by these epithets in relation to the extent and the mode in which it has been heretofore recommended and practised, and not in regard to what I consider "judicious pruning," for which I am an advocate as well as those who have controverted my opinions. A writer, in your Number of July 27, who signs himself "W. H.," quotes a sentence of mine, I think rather incorrectly, viz.—that "I never saw a magnificent stem that had not a proportionally large head;" and proceeds to ask me whether I had not seen a magnificent head that had not a proportionally large stem? I answer, yes; and there are some specimens very near me now, and the cause of the disproportion is pruning—extreme pruning, vulgarly called pollarding. My opinion formerly expressed, and not correctly quoted by "W. H.," is—that I never saw a magnificent stem but what, at some period of its life, had a proportionally large head; for I have seen many magnificent stems with little or no head at all, but that is quite beside the question. Your correspondent is quite right in preserving any and every tree that is an ornament to his grounds, whatever its proportions. It is worth considering, however, whether his magnificent heads would not be quite as ornamental if they had also proportionally magnificent stems? I quite agree with "W. H." on the propriety of planting Oak wherever the character of the soil and other circumstances are favourable to its growth; not, however, to the exclusion of other things. I agree with him also as to the desirableness of clean, straight timber, for useful purposes, &c. I commend him for his attention to his plantations—a pleasing contrast to the general neglect and mistaken management we so often witness. His 40 years' experience entitles his opinion to respect; but, query—What is "judicious pruning?" It is a phrase, I fear, mistakenly—as it is variously—understood. Were "W. H." here, I could show him abundance of Oaks out of which "the builder might cut his stout beam or girder," not only 25 or 30 feet, but 35 or 40—some even 50 feet, that, in all likelihood, were never touched by a pruning instrument in their lives. Now, again, what is "judicious pruning," and how long is it to continue? If those who are so zealous in advocating the process generally, would define what it is particularly,

and to what period of a tree's existence it is to be continued, we should then be able to form more correct ideas of how far "W. H." is justified in his concluding affirmation—"that increased vigour, stature, and bulk are its sure result;" a position which, though backed by 40 years' experience, I must still very seriously question.—*Quercus.*

Swan Marking.—For the sake of the reader who is unacquainted with what is called "swan marking," I shall briefly state how that is done, without entering into details as to when and how such laws or regulations relative to swans were established. When swans are kept on large streams by different proprietors, their servants meet about the last week in August, and besiege, as it were, the river, and cut the same kind of mark on the beaks of the young swans as that on the bills of the parent birds. They also pinion, or cut off the two first joints from one wing—one joint not being enough—then return the bird to the water. By that means each proprietor's swans are known. When it happens that swans belonging to different proprietors mate together, the brood are equally divided, the odd cygnet always going with the cock bird. In order to settle disputes, the old swans are caught and claimed by the marks already noticed. Some speak against pinioning of swans. I suspect, however, that the necessity of it is apparent; for, supposing they were not migratory, and had the use of their wings, is it likely they would suffer themselves to be caught by the neck with a crook, as a shepherd does his sheep? Even in the pinioned state it is attended with difficulty, especially in large rivers. On the Yare I lately observed a brood of 10 swans, being the greatest number I ever saw or heard of. Those acquainted with Ornithology know that our common swan is not identical with the wild sort that visits us in winter, but with what is called the mute swan common in Russia, and is met with in some parts of this country, without a master.—*J. Wighton.*

Strawberries, Asparagus, &c.—With all due deference to "Villagius," I must demur to the inferences contained in his letter last week. In nine cases out of ten, according to my experience, if you manage two Strawberry-beds in the same way—one bed being one, and the other three years old—you will have the best crop from the latter. Therefore it is quite clear, as his crops were equal according to superficial observation, his experiment proved against the mutilating, unscientific system of cutting off the lungs of the plants. Now, as to the time of applying salt to Asparagus, I have stated the result of practice, not theory. I have applied salt, after dressing in the autumn and early in the spring—1 lb. to the square yard—with the most striking advantage. Now the questions to decide upon this interesting subject are—1st, Do we actually apply the salt to the dormant root, by covering the surface in autumn? To this question I answer in the negative; inasmuch as the salt has to be washed through a considerable depth of soil before it reaches the root, and it is only reasonable to infer that when it does arrive there, its caustic character will have materially altered by dilution and chemical decomposition. 2d, Will not the salt do decided harm by being applied to the delicate green, living texture of the young shoots late in spring? Let "Villagius" try it, and I will wager him the best dish I cut next year that he will destroy or materially injure his plants. But, as I said before, I made my statement from practice, not theory. My beds are now looking beautiful, with lofty, flourishing plants. As soon as they begin to die back, I shall cut and dress them, and apply the salt as heretofore on the surface, to be gradually washed in by the winter rain. Should I fail, I hope "Villagius" will tell me where to send him the lost wager.—*C. R. Bree, Stowmarket.* [We quite agree.]

Toads and Frogs.—A few weeks ago, among "Notices to Correspondents," I observed an inquiry in reference to toads: the question was—Do they eat slugs? I am now enabled to say that they do. I am satisfied that they are carnivorous, and that they do not eat either fruit or vegetables. I referred to the "Penny Cyclopædia," and found an excellent article under the word "Frog." I there learned that they live on slugs and other small animals; that they take their prey with great rapidity and swallow it immediately, without mastication. I went into my garden, found a slug, and put it on the end of a stick, and gently introduced it before a toad; I kept my eye upon it, and soon it disappeared; and at the same time I saw the toad swallow: so rapidly, however, had the toad taken the slug in with his tongue, that I did not see it done. I believe both frogs and toads live on the pests of the garden. I am always glad to see them. Last summer I had many slugs, and they destroyed several crops; this summer I have had plenty of frogs and toads, and very few slugs.—*Jasper Stokes, Birmingham.*

Pine-apples.—As the system of growing and fruiting Pines without pots is becoming general, it is desirable to become acquainted with those substances which are most conducive to their growth. It is evident that Pines when planted out attain more robustness, and this mode is certainly more natural than that of confining them in pots; but whether it is more favourable to the production of larger fruit than the old plan, remains to a certain extent undecided. Pines will grow in any soil, and other plants will do the same, but the results will be different. A strong soil favours the production of large fruit, and in this the habit of the plant is more compact; a light substance, such as leaves or tan, has an opposite effect—the plant and fruit grow quite disproportionate. Pines growing in leaves half decomposed, will, in a given period, be larger plants than those growing in loam; the leaves are equally broad and the roots are more abundant, but they are altogether deficient in substance and compactness. I cannot suppose there is any advantage to be derived from laying up a heap of soil before it is wanted for use, particularly when a few inches only of the surface is taken. When spread about that depth it is more exposed to every atmospheric change than when it is in one mass and turned several times during a twelvemonth. In preparing a bed over a tank the first stratum should consist of rough gravel for two or three inches in depth; above that the same depth of leaves or other litter should be laid; then the last layers, consisting of two parts loam, one leaf-mould, and one horse-droppings, well mixed together, should be fifteen or eighteen inches in depth. Pines grown in such a compost, and duly attended to with heat, will reward the owner with excellent fruit. Sometime ago I was informed by a gentleman, lately residing in India, that in some of the Pine districts near the sea, where the soil is naturally strongly impregnated with saline substances, Pines flourish and produce enormous fruit. The ocean, at times, flows over the ground; probably, therefore, a little salt introduced into soil for Pines might prove efficacious to them.—*Mémet.*

Gray Parrot.—I have read the different statements respecting the treatment recommended for keeping a favourite bird from plucking off its feathers. My treatment in regard to its food is quite the reverse of many of your correspondents. I have two fine birds, which I have had for this last seven or eight years; their food has been bread and butter in the morning, meat two or three times a-day, or anything the family may have—such as Potatoes, pudding, cake, fish, fruit — everything except salt meat; that is avoided, if too salt. Their tins are filled with clean water every day, and their cages cleaned out and sand put in; they take tea, and spirits with water when given them; they are taken out on the hand every day, and fondled over two or three times to exercise their wings, which I consider is very beneficial to their health and the beauty of their plumage. I have never given them any seed or soaked bread. With the above treatment my birds have always been in good health; their plumage has always been good, and they have never lost their feathers till the time of moulting, and even then they have never looked unsightly.—*James Woods, Harwich, Essex.*

Variegated Leaves.—Mr. Groom has stated in last Number that the leaves of some of his Pelargoniums have become regularly edged with white in consequence of his having watered the plants with sulphate of ammonia which had been exposed to the air for some time. Last autumn I planted many young Box-trees; and I have for some weeks observed that nearly all the young leaves in most of them are symmetrically tipped with white, giving the young branches a mottled appearance. I counted twelve trees thus affected. The older leaves are rarely tipped, with the exception of two bushes, in which they are regularly tipped, and the younger ones much less so. Mr. Groom states that in his Pelargoniums the older leaves are chiefly affected. The Box-trees are quite healthy, and growing well. I gave to some of them nitrate of soda, but it has made no difference in this variegation. Those growing in deep shade are not tipped, nor are some older trees. These facts may appear trivial; but I think the first appearance, even if not permanent, of any peculiarity which tends to become hereditary (as I fear is the case with the variegated Sycamore) deserves being recorded. — *C. Darwin.* Mr. *H. W. Bucknall*, of Bedminster-lodge, Bristol, also forwarded leaves taken from three Greengage Plum-trees, which were regularly edged with yellow. Mr. Bucknall writes that the trees were watered with ammoniacal liquor diluted with five times its bulk of water by mistake, instead of ten times. The whole of the leaves of each tree have turned yellow round the edges, the rest remaining a healthy green. The trees perfected their fruit well, and are otherwise in good health. The same mixture, he adds, was used on Peaches and Nectarines, but did not affect them.

Lilium lancifolium album, &c.—In the spring of 1843 I paid three guineas for a flowering bulb of one of these fashionable Liliums, which flowered well, and also ripened a pot of seed, which I sowed in a shallow box; this was kept during the whole summer in a Melon-frame, and was watered and nursed with particular care. Notwithstanding this, however, not more than half a dozen plants ever appeared; these did not produce more than one leaf, and put forth small bulbs about the size of a grain of Wheat. After these were fully ripened, I proceeded to take them up, and in so doing I was surprised to find the whole of the soil in the box full of bulbs, superior even to those that appeared; they were an inch deep in the soil on which the seeds producing them had been laid upon the surface; the seeds, as they swelled by moisture, were barely covered. I have thus most unexpectedly found myself in possession of 180 bulbs; and I should like to know how these wholesale underground operations were conducted. This circumstance should induce others to examine narrowly their seed-pans before discarding them; as, before this was known to me, I am sure that I have sacrificed thousands of bulbs.—*N. M. T.*

Transmutation of Corn.—Is it possible that Wheat, Barley, and Oats, can change, from being kept from coming into ear? If so, then perhaps it may be true that Primroses, turned root upwards and made to grow so, become Cowslips. I have always laughed at the idea, but it is believed in some parts of Wiltshire. I have been also told that if single Primroses, Tulips, Polyanthuses, and Auriculas, are turned root upwards, they will become double in a year or two. Can it be? Mignionette kept from flowering for a year becomes a shrubby plant and perennial, but still it remains Mignionette, only much more powerful as to scent.—*A Non-believer.*

Wistaria sinensis.—I have a plant of this truly beautiful and ornamental climber, about five years old, which has been allowed to grow in a very irregular state; no attention has been paid to it during that period. Early in March of this year I thought, on seeing the noble specimen in the Horticultural Gardens at Chiswick, that something might be done to assist Nature in forming a similar specimen, in course of time, out of my deformed plant. Accordingly, I cut and trimmed all the branches to within a quarter of a foot of the stem, leaving two wood-buds, and also flower-buds, varying from one to three on each spur; after which it has bloomed well. About the middle of March I commenced giving it a plentiful supply of water, twice or three times a week. This I continued to do for about six weeks, occasionally loosening the ground about the roots, so as to prevent the earth becoming baked under the influence of a May sun. It went on growing, and still continues doing so; but two of the principal shoots, measuring 26 feet, the growth of this year, have turned by a freak of Nature into monstrosities as flat and about the same thickness as a penny-piece. They are about 7 feet in length, turning upwards and dividing into two branches at the extremity: one branch measures two and the other one foot from the division. Will you inform me what plan, under these circumstances, had better be adopted, in order to insure a healthy and vigorous growth next spring.—*T. D. Gordon.* [Your branch is what botanists call fasciculated; it is of no consequence, for the new branches, &c. will come from it all the same if you get it ripe. It arises from over-luxuriance.]

Country Shows.—We have a Society in our village, and on the morning of its July meeting I met a respectable tradesman whom I shall call Mr. Smith, and said: "Well, Mr. S., I suppose I shall see some of your plants at the Show to-day?" Mr. S. "No you won't, ma'am. What is the use of my sending plants when —— and —— and —— will beat me out and out? Haven't they the use of the greenhouse, stove, manures, and all that their masters' purse can buy; and what chance can I have with my frame only? Depend upon it, ma'am, those Horticultural Societies will not last long, if they don't alter! Now, if I had a chance of a prize I would send my plants, and I would take my family, and some of my friends would go too, and then they would get as many shillings towards their funds; but now I stay at home, or I go to the Stag and smoke my pipe instead." X. "Then you think there should be a prize for tradesmen, or those persons who possess a frame only?" Mr. S. "Certainly I do; but, bless you, they'll never do anything till they let the women have a share." X. "Then you think there should be a lady's prize?" Mr. S. "No, I don't mean quite that—I mean that there should be prizes for women only; let there be two of them—one for ladies, and the other for women in a lower rank, or it will be just the same as it is now with the men. Why, ma'am, it would do no end of good; instead of being stitch, stitch, stitch, all day long at that worsted-work, why they would get out into the air, and it would do them a world of good." X. "Well, Mr. S., I should be glad to see your suggestions carried into effect; but I fear——" Mr. S. "Ah, well, ma'am, all I can say is, that if something is not done our Society will die of consumption; and if they will only use a little common sense about their rules, why they will prevent consumption in others, for instead of spending our evenings at a tavern, we should be tending our plants." We then separated, and I send Mr. Smith's hints, as showing what I know to be general sentiments respecting garden societies.—*X.*

Onions.—A piece of garden ground, 13 yards long, and 4 feet wide, cultivated by Mr. Everitt, gr. to D. Hoste, Esq., Barwick House, Norfolk, produced this year 28 st. 12 lbs. of White Spanish Onions. Is not this an unusually fine crop?—*W. E.*—[Very.]

Wasps.—A few weeks since I observed in the *Chronicle* a statement made by a correspondent to the effect that a wasps' nest might be easily destroyed by means of turpentine. I have since tried the experiment, and, in accordance with your correspondent's directions, I inserted the neck of a bottle containing a small quantity of turpentine into the mouth of the hole, and plaistered it round with clay. The result was, that it not only did not destroy the nest, but the next morning a wasp, perfectly alive, actually came out from the bottle! I wish to know wherein I was wrong in making my experiment, and how your correspondent reconciles this fact with his former statement.—*H. P.* [Spirits of turpentine poured into wasps' holes will certainly kill them; the bottle experiment we have not tried].

Growth of Trees.—Respecting the elongation of the spaces between the tiers of branches on a tree after they are formed, it is said, that after a year's stem-shoot is fully formed, it will elongate, and that a side-branch at one time—say any given number of feet from the ground—shall in a few years afterwards be raised considerably higher from the surface. Whoever defends such a notion has surely never attentively observed the growth of trees. Take a Fir, for instance, after it has been planted, even 20 or more years, it will be found that the lower branches are as close to the surface of the ground as when it was planted, and of course the distance between each successive tier of branches remains of the same length, as those spaces never elongate after they are formed.—*W. Billington.*

COUNTRY SHOWS.

Bury Floral and Horticultural Society, Aug. 21.—This was the second meeting for the exhibition of Carnations, Picotees, Stove and Greenhouse-plants, Dahlias, Fruits, and Vegetables, &c. It was held in the Victoria Gardens. The morning was rather unfavourable; but the number of articles for exhibition was, nevertheless, so numerous, that the marquee, which is 22 yds. long by 10 yds. wide, was scarcely large enough to contain them. We were pleased to see the Cottagers had taken the advantage of the opportunity offered them to contend for the prizes given by the Society. Thirty-eight exhibited in this class, and their productions did honour both to their table and the exhibition. We hope that the success which has attended the Exhibitors in the Cottager's class will be the means of making many earnestly set about cultivating their little gardens and bringing their productions to future Exhibitions. The wealthier classes expressed their astonishment at seeing such good fruit, flowers, and vegetables as were exhibited on the Cottager's table, and are anxious to afford them every means of encouragement. The prizes were awarded as follows: CARNATIONS—*Scarlet Bizarre*: 1, Ely's Jolly Dragoon, Mr. J. Cheetham; 2, Omnium Primum, Colonel Lee; 3, Kershaw's Duke of Richmond, Mr. W. Leach; 4, Duke of Leeds, Mr. J. Cheetham; 5, Don John, Mr. J. Cheetham; 6, Gameboy, Mr. R. J. Kaye. *Crimson Bizarre*: 1, Lord Milton, Mr. W. Cheetham; 2, Paul Pry, Colonel Lee; 3, Seedling, Mr. J. Hurdman; 4, King Alfred, 5, William Caxton, 6, Rainbow, Colonel Lee. *Scarlet Flakes*: 1, Chadwick's Brilliant, 2, William the Fourth, 3, Ringleader, Colonel Lee; 4, Potter's Champion, Mr. J. Scholes; 5, Beauty of Bradley, Mr. R. J. Kaye; 6, Marquis of Granby, Colonel Lee. *Rose Flakes*: 1, Duchess of Devonshire, Colonel Lee; 2, Lovely Ann, Mr. R. J. Kaye; 3, Duchess of Sutherland, Mr. Holland; 4, Apollo, Mr. R. J. Kaye; 5, Dobbin's Mountaineer, Colonel Lee; 6, Lady Ely, Mr. Dunderdale. *Purple Flakes*: 1, Euclid, 2, Princess Charlotte, Colonel Lee; 3, Elizabeth, Mr. J. Hurdman; 4, Bellerophon, 5, Mungo, 6, Commander, Colonel Lee. PICOTEES—*Purple, heavy-edge*: 1, Nulli Secundus, Mr. J. Cheetham; 2, Beauty of Wurley, Mr. R. J. Kaye; 3, Victory, 4, Bonny Bet, Mr. W. Leach; 5, Kaye's Monarch, 6, Jackson's Delight, Col. Lee. *Purple, light-edge*: 1, Nulli Secundus, Mr. W. Leach; 2, Field Marshal, Mr. T. Smith; 3, Grace Darling, Mr. W. Lodge; 4, Prince Albert, Mr. J. Scholes; 5, Royal Adelaide, Mr. W. Lodge; 6, Seedling, Mr. Holland. *Red, heavy-edge*: 1, Duchess of Cambridge, Mr. R. J. Kaye; 2, Marshal Soult, Mr. Holland; 3, Marc Antony, Colonel Lee; 4, Mrs. Horner, Mr. Lodge; 5, Little Wonder, Colonel Lee; 6, Duke of Wellington, Mr. R. J. Kaye. *Red, light-edge*: 1, Mrs. Maynell, Mr. Holland; 2, Mrs. Horner, 3, Nonpareil, Colonel Lee; 4, La Superb, Mr. Lodge; 5, Princess Sophia, Mr. Holland; 6, William the Conqueror, Mr. R. J. Kaye. DAHLIAS—*Dark*: 1, Essex Triumph, H. Openshaw, Esq.; 2, Garrick, A. Wood, Esq.; 3, Standard of Perfection, 4, Sir R. Sale, Mr. J. Gaskell. *White or Blush*: 1, Antagonist, 2, Emma Noke, Mr. Gaskell; 3, Lewisham Rival, 4, Coronation, A. Wood, Esq. *Yellow or Orange*: 1, Aurantia, Mr. Lodge; 2, Argo, Mr. Gaskell; 3, Parkmount Rival, Mr. Lodge; 4, Lady Stamford, Mr. Gaskell. *Lilac or Purple*: 1, Standard of Perfection, Mr. C. Noyes; 2, North Midland, Mr. Lodge; 3, Lady Harlam, H. Openshaw, Esq.; 4, Pickwick, Mr. Gaskell. *Scarlet and Red*: 1, Eclipse, 2, Tournament, Mr. Gaskell; 3, Duke of Cornwall; H. Openshaw, Esq.; 4, Scarlet Defiance, Mr. T. Davenport. *Rose and Crimson*: 1, Attilla, 2, Miss Abbot, Mr. Gaskell; 3, Mrs. Shelley, Mr. J. Ashworth: 4, Competitor, H. Openshaw, Esq. *Edged and Tipped*: 1, Lady Antrobus, Mr. C. Noyes; 2, Beauty of the Plain, Mr. Lodge; 3, Lady Antrobus, Mr. T. Davenport; 4, Madame Chouvieri, Mr. Lodge. AMATEURS—24 *varieties*: Mr. T. Davenport. AMATEURS AND GENTLEMEN'S GARDENERS—12 *varieties*: 1, H. Openshaw, Esq.; 2 and 3, Mr. J. Gaskell. GREENHOUSE PLANTS: 1, Mr. Thos. Davenport; 2, Daniel Grant, Esq. *Single Specimens*: 1, Lilium lancifolium, Mrs. Ramsbottom; 2, Helichrysum proliferum, R. Ashton, Esq.; 3, Fuchsia formosa elegans, Mr. T. Davenport; 4, Rose Louis-Phillipe, 5, Rosa odorata, Miss Grundy. STOVE PLANTS—1, Lantana mutabilis, L. crocea, Nerium oleander, Ardisia crenulata, R. Ashton, Esq.; 2, Gloxinia tubiflora, Thunbergia alata, Daphne odora, Ardisia crenulata, &c., D. Grant, Esq. *Single Specimens*: 1, Thunbergia alba, J. Fenton, Esq.; 2, Achimenes pedunculata, R. Ashton, Esq.; 3, Zygopetalum maxillare, J. Fenton, Esq.; 4, Cockscomb, Mr. Gaskell; 5, Ardisia crenulata, D. Grant, Esq. *Pansies, 24 varieties*: 1, Mr. T. Cross; 2, Mr. N. Cronshaw; 3, Mr. Cross; 4, Mr. Noyes. 12 *varieties*: 1 and 2, Mr. N. Cronshaw; 3, Mr. Cross; 4, Mr. N. Cronshaw. *Pines*: 1 and 2, Providence, 3, Montserrat, J. Fenton, Esq. *Black Grapes*, 1, Lombardy, J. Fenton, Esq.; 2, do., Mrs. Ramsbottom; 3, Black Hamburgh, D. Grant, Esq. *White Grapes*: 1, White Muscat, D. Grant, Esq.; 2, do., Mrs. Ramsbottom; 3, do., Mr. Richardson. *Melon*: 1, Mr. Noyes; 2, Cantaloupe, D. Grant, Esq.; 3, J. Fenton, Esq. *Peaches*: 1 and 2, D. Grant, Esq.; 3, Miss Grundy. *Nectarines*: 1 and 2, D. Grant, Esq.; 3, Miss Grundy. *Apricots*: Miss Grundy. *Plums*: D. Grant, Esq. *Dessert Apples*: Mr. Cross. *Culinary Apples*: 1, Mr. Noyes; 2, Mr. Cross; 3, R. J. Grundy, Esq. *Dessert Pears*: 1, R. Hucking, Esq.; 2, Miss Grundy; 3, Mr. Noyes. *Culinary Pears*: 1, Mr. Noyes; 2, Mr. Cross; 3, R. Hucking, Esq. *Alpine Strawberries*, J. Faulkner. *Orange-tree in fruit*: 1, D. Grant, Esq.; 2, Mrs. Ramsbottom. *Lemon-tree*: 1, Mr. Richardson. *Cucumber*: 1 and 2, Mrs. Ramsbottom; 3, R. Ashton, Esq. *Mushrooms*: 1 and 2, R. Ashton, Esq.; 3, J. W. Swannick, Esq. *Peas*: 1, Mr. Davenport; 2, A. Wood, Esq.; 3, Mr. Ashworth. *Broad Beans*: 1, Mr. Cross; 2, Mr. G. Jackson; 3, R. Hucking, Esq. *Kidney Beans*: 1, Mr. Faulkner; 2, A. Wood, Esq.; 3, D. Grant, Esq. *Celery*: 1 and 2, A. Wood, Esq.; 3, Mr. J. W. Swannick. *Cauliflower*: 1, Mr. Faulkner; 2, Mrs. Ramsbottom; 3, Mr. Faulkner. *Broccoli*: 1 and 2, J. Fenton, Esq.; 3, D. Grant, Esq. *Cabbage*, 1, Mr. J. W. Swannick, 2 and 3, R. Hucking, Esq. *Red Cabbage*: 1, Mrs. Ramsbottom; 2, R. Ashton, Esq. *Parsnips*: 1, Mr. G. Jackson; 2, J. Fenton, Esq. *Turnips*: D. Grant, Esq. *Carrots*: D. Grant, Esq. *Artichokes*: 1, J. Fenton, Esq.; 2, Mr. Noyes. *Beet-root*: 1, D. Grant, Esq.; 2, J. Fenton, Esq. *Onions* (Autumn-sown), Mr. J. Jackson. (Spring-sown): 1, Mr. Noyes; 2, Mr. Cross; 3, Mr. H. Smith. *Endive*: Mr. J. W. Swannick. *Parsley*: 1, A. Wood, Esq.; 2, D. Grant, Esq. *Lettuce*: 1, R. Ashton, Esq.: 2, J. Fenton, Esq. COTTAGERS: *Pelargoniums*: 1, T. Holt; 2 and 3, T. Allen. *Dahlias*: J. Sykes. *Apples*: 1, J. Foster; 2, T. Greenhalgh; 3, J. Knott. *Pears*: 1, J. Foster; 2, T. Booth; 3, T. Greenhalgh. *Plums*: T. Greenhalgh. *Peas*: 1, R. Olivant; 2, T. Booth; 3, J. Chatterton. *Beans*: 1, B. Pickstones; 2, C. Hilton; 3, A. Taylor. *Celery*: J. Kaye. *Cabbage*: W. Tweedale. *Red*: 1, T. Pollett; 2 and 3, T. Booth. *Carrots*: 1, J. Fletcher; 2, M. Millet; 3, J. Sykes. *Turnips*: 1, D. Astley; 2, H. Partington; 3, M. Millett. *Onions*: 1, J. Pollett; 2, W. Bowker; 3, T. Pollett. *Lettuce*. T. Booth. *Parsley*: T. Booth. [We have inserted this at the particular request of the reporter; but we cannot again depart from our rule of excluding reports without the names of the flowers or fruit that win.]

Hunts. Horticultural Society.—This was the annual Show of the Huntingdonshire Horticultural Society: the display of fruit and flowers was small compared with former years.—CARNATIONS.—*Scarlet Bizarre*: 1, Barringer's Fair King, Mr. F. Barringer; 2, Hepworth's Leader, Mr. Giddings; 3, ditto, Mr. J. Barringer. *Purple*: 1, Barringer's Surprise, Mr. J. Barringer; 2, ditto, Mr. Wood. *Flake Scarlet*: 1, Lydia, Mr. F. Barringer; 2, ditto, Mr. J. Barringer. *Purple*: 1, Beauty of Woodhouse, Mr. F. Barringer; 2, Queen of Sheba, Mr. Franklin. *Rose*: 1, Barringer's Apollo, Mr. F. Barringer; 2, ditto, Mr. J. Barringer; 3, Sir George Crewe, Mr. Franklin; 4, Barringer's Apollo, Mr. F. Barringer. PICOTEES.—*Purple*: 1, Wood's Princess Alice, Mr. Wood. *Dark Red*: Duke of Wellington, Mr. Franklin; 2, ditto, Mr. F. Barringer; 3, Sir Robert Peel, Mr. Giddings. *Scarlet or Pale Red*: 1, Sir Robert Peel, Mr. Barringer; 2, Duchess of Sutherland, Mr. Franklin; 3, Hector, Mr. Franklin. *Rose*: 1, Queen Victoria, Mr. J. Barringer. *Yellow*: 1, Maid of Middelburgh, Mr. J. Barringer. *Best Picotee*, by Amateurs: Queen Victoria, Mr. Price. GOOSEBERRIES.—*Heaviest Red*: 1, Wonderful, Mr. Giddings; 2, ditto, Mr. Giddings. *Yellow*: 1, Piggot's Leader, Mr. Giddings. *Green*: 1, Pumper, Mr. Giddings. *White*: 1, Ostrich, Mr. Newman. *Extra Prizes* were given to Mr. Slight for a beautiful Achimenes grandiflora; to Mr. J. Barringer for Cockscombs; and to Mr. Giddings for Elton Strawberries.—*Cambridge Chronicle.*

Isle of Wight Horticultural Society, Aug. 28.—This was the second and last Exhibition for the season. The Prizes were awarded as follows:—*Stove or Greenhouse Plants.*—1, Mr. Barnicle, gr. to J. Percival, Esq., for Lisianthus Russellianus, Amaryllis striatiflora, Erythrina crista-galli, Hibiscus sinensis roseus, Hibiscus Cameroni, and Vinca alba; 2, Mr. Jobling, gr. to the Rev. A. Hewitt, for Statice arborea, Vallota purpurea, Crassula falcata, Gesnera zebrina, Achimenes pedunculata, and Clerodendron speciosissimum. *Twelve best Roses.*—1, Mr. Meehan, gr. to Col. Harcourt, for Lamarque, Emile Courtier, latifolia, Abbé Mirland, Lyonnais, Henri Berbet, Bernard, Don Carlos, La Biche, Pourpré supérieur, Clara Sylvain, and De Neuilly; 2, Mr. Jobling for Jaune Desprez, Lady of the Lake, Aimée Vibert, Philip the First, Noisette multiflora, Lee's Crimson, Madame Desprez, Bougare, Hymenée, and Fabvier. *Fuchsias.*—1, Mr. Barnicle for Pageana, Coronet, Modesta, Vesta, Neptune, Coccinea, Toddiana, Moneypenii, magnifica, insignis, tricolor, and Albion; 2, Mr. Meehan for Epsii, Defiance, Brockmanii, Exoniensis, St. Clare, Formosa elegans, Toddiana, magnifica, tricolor, conspicua arborea, transparens, and racemiflora. *Cockscombs.*—Mr. Bone, gr. to Mrs. Lind. *Dahlias.*—1, Mr. Bone for Squibb's Defiance, Princess Royal, Stella, Majestic, President of the West, Ne Plus Ultra, Scarlet Eclipse, Grace Darling, Lady Bathurst, Rival Sussex, Phenomenon, and Beauty of Sussex; 2, Mr. Barnicle for Springfield Rival, Admiral Stopford, Scarlet Defiance, Squibb's Defender, Virgin Queen, Marquess of Lothian, Bonaparte, Purple Perfection, Rival Sussex, and three seedlings. *German Asters.*—Mr. Jobling. *Verbenas.*—1, Mr. Barnicle for Boule de Feu, Queen, Bridesmaid, Stewart's Purple, Renown, Ingramii, Prince of Wales, Groomiana, Strata coccinea, Mortlock's Superb, Unique, and Burstii (these were in pots); 2, Mr. Jobling for Teucroides carnea, Unique, Groomiana, Stewart's Purple, Queen, Joan of Arc, Hendersonii, Melindres superba, Laconii, Incisa, Ingramii, and Renown. *Seedling Pansy.*—Mr. Meehan for a dark variety. *Grapes.*—Mr. Jobling for Black Hamburgh. *White Grapes.*—1, Mr. Bone for White Sweetwater; 2, Mr. Barnicle for the same. *Peaches.*—1, Mr. Meehan for Chancellor; 2, Mr. Bone for Noblesse. *Nectarines.*—1, Mr. Meehan for Newington; 2, Mr. Jobling for White Nectarine. *Plums.*—1, Mr. Meehan for Greengages. *Apples.*—1, Mr. Thompson for Kerry Pippin; 2, Mr. Barnicle for Quarrenden. The following *Extra Prizes* were awarded:—To Mr. Bone for Balsams; to Mr. Meehan for a stand of 24 Pansies (chiefly seedlings), for Hollyhocks, and for a single specimen of Clerodendron speciosissimum; to Mr. Jobling for *Phloxes*, viz.: Wheelerii, Sheperdii, speciosa, omniflora, cordata grandiflora, excelsa, pendulifolia, Drummondii varieties, Pyramidalis, reflexa, and incarnata; to Mr. Barnicle for Gloxinia maculata, and for a seedling Dahlia (white, tipped with vermilion), for six Cockscombs, and for two bunches Black Hamburgh Grapes; to Mr. Thompson for six Newington Nectarines.

Morningside Practical Gardeners' Society.—This was the third meeting for the season. The following prizes were awarded:—*Seedling Pelargonium.*—1, Mr. J. Downie, gr. to General Robertson, for Miss Easton; 2, Mr. H. Gibb, gr. to Mrs. Stark, for Gem. *Seedling Pansy.*—1, Mr. T. Ovens, gr. to Alexander Russell, Esq., for Queen Bess; 2, Mr. J. Downie for Little Wonder. *Roses.*—Mr. H. Gibb for Crested Moss, Madame Hardy, Village Maid, Louis-Philippe, Ne plus Ultra, and Fulgens. *Pinks.*—Mr. T. Ovens for Queen Victoria, Nimrod, Tweedside Beauty, Miss Brandland, Nymph, and Rainbow. *Verbenas.*—Mr. J. Downie for Vivid, Princess Royal, Burleyana, Tweediana picta, Howardii, and Ingramii. *Calceolarias.*—Mr. J. Downie for Standishii, Duchess of Buccleuch, and Lady Constable. *Salvias.*—Mr. J. Downie for Fulgens, Patens, and Grahamii. *Picotees.*—Mr. J. Young for Duchess of Kent, Incomparable, and Nulli Secundus. *China Asters.*—Mr. W. Denholm, gr. to Sir J. Forest, Bart. *Stocks.*—Mr. J. Young. *Herbaceous Plants.*—Mr. J. Downie for Phlox omniflora, Delphinium Barlowii, Double Scarlet Lychnis, Lathyrus latifolius, Campanula grandis, and Chelone barbata. *Grapes.*—Mr. J. Fergie for Black Hamburgh. *Melons.*—Mr. W. Denholm for Duke of Bedford. *Gooseberries.*—Mr. J. Gould for Porcupine. The Prize by Messrs. Dickson and Son, Nurserymen, Inverleith, for the best one-head of *Cauliflower*, was won by Mr. T. Wood, gr. to A. Falconar, Esq.—The Prize by Mr. M'Intosh, Agent for Messrs. W. Wood and Son, for the best 6 Roses, was won by Mr. J. Downie with Boule de Nanteuil, Kean, Triomphe de Montmorency, Bourbon Queen, Moss du Luxemburg, and Louis-Philippe.—Mr. J. Gould, gr., Canaan Cottage, exhibited a very fine plant of a seedling Maurandya, for which an extra Prize was awarded.—There were also exhibited from Grange Bank some pretty seedling Pansies.

West Bromwich Floral and Horticultural Society, Sept. 29.—This, the first Exhibition of the Society, went off much better than was expected. A. Kenrick, Esq., sent a miscellaneous collection of stove and greenhouse plants, not for competition, amongst which were fine plants of Gesnera zebrina, Achimenes grandiflora, longiflora, and rosea; Vinca alba, and V. rosea; Erica ampullacea, and Irbyana; Fuchsia formosa elegans, and Lanelli; Citrus Aurantium, and two fine plants of Nerium splendens, gracefully bending under the beautiful trusses of rose-coloured flowers.—Messrs. Pope and Sons also sent a collection of plants, not for competition, containing fine specimens of Cycas revoluta, Cereus lanuginosus and pentagonus, Erica Irbyana, ampullacea, and viridiflora; and other plants of equal merit. The following is the list of Prizes:—*Fuchsias.*—1, Exoniensis, Mr. Woodward. *Best Three.*—Lanelli, Balloonii, and Conspicua arborea, Mr. Woodward. *Greenhouse Plants.*—1, Agapanthus umbellatus, Mr. Woodward. *Best Three.*—Fuchsia corymbiflora, the Pelargonium named Sylph, and a seedling Calceolaria, Mr. Woodward. *Extra Prizes.*—Nerium splendens, Mr. Woodward.

Ancient Society of York Florists, Sept. 5. (Established prior to 1760.)—This was the Dahlia Show, which is the last Meeting for the season. The Prizes were awarded as follows:—*Premier Dahlia*: Mr. Quarton, Standard of Perfection. *Dark Puce, Maroon, or Crimson*: 1, Mr. Quarton; 4, Mr. Edward; 5, Mr. Summers, with Essex Triumph; 2, Mr. Edward, with Sir H. Pottinger; and 3, Mr. Quarton, with Admiral Stopford. *White or Blush*: 1, 4, Mr. Quarton; and 5, Mr. Summers, with Bridesmaid; 2, Mr. Edward, with Beauty of Bucks; and 3, Mr. Edward, with Mrs. James Richardson. *Light or Dark Rose*: 1, Mr. Quarton, with Mrs. Shelley; 2, Mr. Quarton, with Widnall's Queen; 3, 5, Mr. Summers; and 4, Mr. Harrison, with Mrs. Shelley. *Buff or Orange*: 1, Mr. Edward, with Orantia; 2, Mr. Quarton, with Marquis of Lansdown; 3, Mr. Edward, with Orange Superb; and 4, 5, Mr. Harrison's Seedling. *Light or Dark Purple*: 1 and 3, Mr. Quarton; 2 and 4, Mr. Edward; and 5, Mr. Harrison, with Standard of Perfection. *Yellow or Sulphur*: 1 and 4, Mr. Quarton; 2, Mr. Edward, with Cox's Defiance; 3, Mr. Summer, with Prince of Wales; and 5, Mr. Harrison's Seedling. *Scarlet*: 1, Mr. Edward, with Carlough's Eclipse; 2, Mr. Quarton, with ditto; 3, Mr. Harrison, with Nonpareil; 4, Mr. Edward, with his No. 12; 5, Mr. Harrison, with Nonpareil. *Light Edged or Tipped*: 1 and 2, Mr. Quarton, with Beauty of Sussex; 3 and 4, Mr. Edward, with Princess Royal; and 5, Mr. Summer, with Princess Royal. *Maroon or Dubonnet*: 1, Mr. Edward, with President of the West; 2, Mr. Quarton, with Girling's Prince of Wales; 3, Mr. Edward, with Madame Charivari; 4, Mr. Quarton, with Rouge et Noir; and 5, Mr. Harrison, with Lord Howden. *Lilac*: 1 and 2, Mr. Quarton, 3 and 4, Mr. Edward, and 5, Mr. Summers, with Miss Abbott. *Seedlings*: Mr. Harrison.

Reviews.

A Descriptive Catalogue of Roses, cultivated for sale by Messrs. Wood & Son. 1844. Taylor.

THIS is another of those descriptive catalogues, the importance of which we last week insisted on. It is divided into two parts, the first including Roses that flower in June and July, the other such as flower from July to November—a very useful variation from the common plans of arrangement, considering how large a part of the wealthy class never see their country residences before the beginning of August. Its orthography has apparently been carefully attended to; but we really abandon all hope of ever ascertaining how the majority of Rose names should be spelt, and therefore cannot blame Messrs. Wood and Son for any errors that have escaped the quick eyes of the reader in Messrs. Taylor's printing office. It is, however, evident that Berlize should be Berlèze, after the writer on Camellias of that name; Casimir Perrier spelt his name, we believe, with one r; Mamorea should certainly be Marmorea; General Kloeber should be Kleber, we presume: and we imagine that for Hypocrate, Columbrière, and Jean d'Arc, we should read Hippocrate, Colombine, and Jeanne d'Arc. However, these are things that Rose-growers think little about.

The Meteorological Ephemeris for 1845; *with Ruled Pages for Observations.* By Henry Doxat, Esq.

MR. DOXAT makes no pretence to weather prophecy, further than may be gained by a very attentive consideration of those influences which may be naturally supposed to influence atmospheric changes. He was so very nearly right this year in some of his anticipations—for they are neither guesses nor predictions—that we intend to watch his "Ephemeris" carefully next year, and we recommend others to do so likewise.

The Mother's Primer; a Little Child's First Steps in Many Ways. By Mrs. Felix Summerly. 12mo. Longmans.

"MY experience with children," says the Authoress, "is, that learning to read may be a pleasant instead of a painful task." We think so too, and recommend mothers to study, by the help of this pretty little book, how to make it so.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

ALONA CŒLESTIS. Sky-blue Alona. (*Greenhouse Shrub.*) Nolanaceæ. Pentandria Monogynia.—It has long been known to botanists that Chile and Peru abound in shrubby plants allied to Nolana, few of which are yet published, but including among them some species of remarkable beauty. Hitherto our gardens have possessed no others than N. prostrata, tenella, paradoxa, and atriplicifolia, of which the first and last alone remain in cultivation. But they are annuals, and, with the exception of the last, of small importance for the purposes of decoration. The shrubs are still to procure. Of these one species, viz. this one, has at last been raised from some of Mr. Bridges's seeds, by Mr. Best, gr. to A. Park, Esq., of Merton Grove, Surrey. It proves to be a very fine thing, with pale sky-blue flowers, each of which remains in beauty for several days. Its habit is that of a soft leaved Heath, and it appears likely to form a bush of some such size as a common Pelargonium. What its proper treatment may be we are unable to tell, having had no opportunity of studying the plant; but we presume it will thrive with the same cultivation as Scarlet Pelargoniums, and we hope it will prove a capital thing for bedding out during the summer. We would, however, suggest to gardeners, that as all the Nolanas appear to be shore plants, salt in small quantities may be found useful in the soil. A plant of it was exhibited to the Horticultural Society in July last, when it received the silver Knightian Medal.—*Botanical Register.*

Garden Memoranda.

Hewell Hall, near Bromsgrove.—At p. 663 of our volume for last year we gave an amateur's sketch of this interesting place. At the risk of repetition we now offer an account of it by a correspondent of great skill as a gardener. Our readers may be anxious to compare the views of two different persons concerning the same array of facts. Hewell Hall is situated in one of the finest parks in England. The mansion is a noble Grecian building, placed in the very worst situation in the whole park. One cannot help admiring the princely liberality that suggested the idea of such a pile, and pause to condemn the taste that could place it in such a situation, and in such a park too! Few demesnes afford so much choice in the site of the mansion as this, having such a diversified surface, and grouped in all directions with huge masses of stately timber. An extensive lake has also been formed near the house, certainly in the best situation for such an ornament. The outline, however, wants boldness and variety; for although conceived on a scale commensurate with the magnitude of the place, it is nevertheless destitute of interest from its inartistical form. This is very strikingly exemplified in the opposite shore running nearly parallel with the mansion: and as the latter does not occupy an elevated situation, the defect becomes more apparent and objectionable. The splendid groups of timber trees which meet the eye in all directions, are, in most instances, judiciously placed. They are composed, however, of trees assimilating greatly in form, and want the Cedar of Lebanon, and in some instances the Lombardy Poplar, to give variety and style to the general character. The

lawn near the mansion can boast of one of the finest pieces of turf in this country; it is the very perfection of what turf should be—quite free from Moss and Plantain, and as smooth as a billiard-table. On this lawn are large masses of shrubs, herbaceous plants, and gay annuals, mixed together and surrounded with a kind of wicker-work, which gives an idea of their being huge baskets of evergreens and flowers. For ourselves we should prefer to see the branches of the Portugal Laurels and other evergreens resting quite unobstructed on the beautiful sward, and the wicker-work inclosing lesser-sized clumps, judiciously distributed, and filled with Scarlet Pelargoniums, Salvias, &c. &c. On this lawn are two very fine Pinus cembra; near it, and connected with the house, is a Dutch garden on a small scale. The walks from this lead to a range of conservatories, filled with plants in the highest health and culture. Mr. Markham pointed out some Camellias to us of an immense size, which he had transplanted in consequence of the alteration and re-erection of these houses; they had not, apparently, received the least check—indeed, nothing could surpass the health and vigour of these truly magnificent specimens. Near this is a rock-garden, formed out of a gravel pit. This is one of the few things of the kind we can bear to look upon. It is a pity, however, that geometrical forms should have been admitted in the arrangement; they are most certainly out of place here; the basins of water for aquatics are raised above the surrounding walks and beds, which should never be in any case; the beds also were rendered too gay with Scarlet Verbenas. The mind in such a scene reverts to those plants we find in rocky wilds and alpine regions, and this feeling should not only be created, but maintained with scrupulous severity. The water in the basins was as pure as crystal—no trifling matter, in our estimation, when water is introduced in garden scenery. How often do we find these receptacles for plants fœtid pools, covered with Duckweed, and swarming with frogs and tadpoles! We observed the walks leading to this garden, and in places where the trees overhang them, edged with a kind of tile. Edgings of this kind are admissible in geometrical gardens of some kinds, but they do not associate well with rural scenery. When the shrubs are not surrounded with turf we should prefer edgings of Ivy, which answers admirably, and would harmonise well with the beauty and character of such a situation. The French garden, as it is styled, is upon an extensive scale, and designed with great judgment and skill. It is just now looking brilliant, from there being an immense display of all kinds of profuse-blooming plants, well arranged and superbly managed. An improvement could readily be effected in this garden by the introduction and right disposition of fastigiate evergreens flanking the broad walks of turf and gravel; such, for example, as the Irish Yew, Cypress, Juniperus excelsa, Cupressus thurifera, Cupressus torulosa, &c., &c. At some distance from the house, in an outer park, is the kitchen garden, which is equally well managed; the fruit trees of every kind are loaded with fruit; the Peach and Nectarine trees against the open walls were quite free from red spider. The kitchen-garden crops were in luxuriant health, evincing none of the signs or effects of this dry season. The Pine-apple, the Grape, the Peach, and the Fig, are here all cultivated in the highest possible perfection; indeed, it would be difficult to point out another place where these are all equally well done. The Pines are chiefly grown in pits, heated by hot-water gutters; the gutters were formed of zinc, but this kind of metal has proved a failure, and Mr. Markham is about introducing Burbidge and Healy's cast-iron gutters, being perfectly satisfied that this is the most efficient mode of obtaining bottom-heat. Mr. Markham has been long celebrated for his superior management of the Grape-vine, and we trust he will, through the medium of the *Gardeners' Chronicle*, favour his less fortunate brethren with his system of culture. The writer of this article has had several opportunities of witnessing the extraordinary success, during the last ten years, attending the culture of the Vine at Hewell, and he can safely aver that he has never seen anything equal to it in Great Britain. It is almost unnecessary to repeat that the whole of these extensive gardens and grounds were in the highest possible keeping; the same order prevails, from the rubbish yard to the lawn and conservatories. The whole of the turf looked as if it had all been mown that morning—the walks all swept, and the whole of the surface of the ground, whether in the flower or kitchen gardens, just stirred and raked. Our attention was directed by Mr. Markham to a most important circumstance, which would have drawn on the incredulity of Mr. Knight himself. That celebrated physiologist considered the Golden Pippin Apple to be in the last stage of decay. Here, however, it is in its youth, growing as vigorously as any Apple in the garden, both old and young trees producing fruit abundantly, without in either the least signs or indication of progressive decline. This doctrine of the deterioration and degeneracy of some of our best old Apples, is unquestionably opposed to analogy in trees generally; and although this instance is somewhat remarkable, it at least leaves the question open for further investigation.—*R. G.*

Miscellaneous.

To Cook Tomatoes.—Take a ripe Tomato, quite red, but not soft. Cut out the stalk and scoop out the seeds, leaving as much of the flesh as possible. Fill the inside with forcemeat (which will be better if mixed with a little chopped ham or tongue). When well stuffed set it in a Dutch oven, in a dish, before the fire, with a piece of butter on the top of the Tomato, and leave it to roast till brown. Care must be taken that it does not burn.

New Discoveries concerning the Pollen of Plants.—Mr. Siegfried Reisseg announces that he has discovered that pollen will produce its tubes in the parenchyma of the stem and leaves, as for instance, that of an Allium in Potato tubers; that it then grows into conferva-like cellular green plantlets; and that pollen will change, under certain circumstances, into animalcules, such as those of Ehrenberg's genus Astasia! What next?

The Jay.—Having the reputation of being partial to the eggs of young birds is quite enough to include this beautiful bird in the list of destructives; its principal food, however, being Acorns and Beech-mast. This terminates, it is believed, those birds that come under the gamekeeper's denomination of "varmint." The rook has been omitted, as it is believed that farmers have now become sensible of the advantages they confer; and instances are known that where, in their ignorance of the utility of the rook in clearing their lands of grubs, &c., they have prevailed on their landlord in getting the rookery destroyed, in a very short time, finding out their error, they have earnestly entreated for its restoration. Still the eye is too frequently disgusted in seeing one of these birds suspended in the field, under the idea of saving a few miserable potatoes, &c. &c. The gardener's list is rather more numerous; it will not be necessary to enumerate all which come under his ban. If the money spent in powder, pay of boys kept from school, and the original cost of the gun, were expended in teaching net-making to those in the parish who are lame, or otherwise infirm, a saving would be obtained, and a moral benefit conferred. Too much praise cannot be awarded to the benevolent exertions of the late Rev. Charles Bathurst, for introducing this art into his parish, superintending it personally, and for the little volume which records his proceedings, with the mysteries of the art of reticulation.*—*J. M.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

After the stove has been kept dry for some time, as is always done more or less from the end of August, the red spider makes its appearance in some collections, in greater numbers than at other times. This is the worst time in the year to permit the ravages of this insect, as if the foliage is now disfigured it must remain an eyesore till next season's growth; therefore on the first appearance of this evil, apply sulphur to the pipes, &c.: and any plants more liable to the attack may now have their winter pruning, rather than be a harvest for the red spider. See that Gloxinias are well ripened before they are set to rest, and likewise that a proper label is fixed to all those kinds which rest periodically. All woody plants ought now to be done growing in the stove; slight fires may be made in the morning: the watering got over early in the day, and a free current of air admitted on all fine days for a few hours.

Conservatory.—Plants in this house, the greatest portion of which are expected to be in flower, may be kept as still as if they were in a Ward's case from this time till the beginning of the growing season; merely giving air to keep down sun heat occasionally; indeed, sun-heat will do no harm from this time, although it should raise the temperature up to 70° or 80° for a few hours, as the excitability of plants is now over. Plants thus treated will get over the winter much easier than where the ventilators are in requisition at every change of our variable climate, as was the case in my younger days; but recollect that unless your plants, pots, borders, walls, trellises, &c. be kept as clean as a drawing-room, this system will not answer with you, as the effluvia rising from decaying leaves, ill-drained pots, and mossy borders, will soon contaminate the confined air, and you must have recourse to constant ventilation, as in the olden times.

Greenhouse, Pits, Frames, &c.—There is no plant, however hardy it may be, that will endure with impunity the drenching rains of autumn, if confined in a pot. An Oak, Ash, or Elm might thus be injured in wet seasons: how much, then, must half-hardy plants endure if exposed in this way! And yet it is no less injurious for them to be housed early; that is, after they have passed the nursery stages. All young and delicate plants, such as Heaths, &c. should now be put into frames, not through fear of cold, but to guard them from the rains and heavy dews; and all large and more hardy sorts should now be placed in the full sun on the south side of hedges, walls, or other screens, and some means of throwing off the wet from them devised. Cinerarias, Chinese Primroses, Calceolarias, and the like, which have been grown on north or shady aspects, should now be changed to face the south. Sufficient quantities of peat, loam, sand, and leaf-mould in a dry state, for winter and early spring potting, should be put under cover at any time now, when they are in a dry state. Our success or failure depends on the state and condition of our compost more than many are aware of.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

We have few finer tribes of plants for bedding out in the summer season than the Petunia, and few genera in which a greater improvement has been effected as to the quality of the flower. One of the finest varieties of the purple class for forming groups is undoubtedly Violacea superba, a variety sent out some years back by the Horticultural Society, and which has the property of holding its colours until the flowers are quite withered. Prince Albert is another variety possessing nearly the same properties, with a little improvement in form; and Duncan's seedling Elegans with a white throat, Beauty, Gem, Newmanii, and Newmanii superba, are flowers of nearly the same colour (purple), the last four are of unusually large size. The great disadvantage of the last four is the looseness of the flowers, and their tendency to burn or lose their colour under bright sunlight. Lady Peel has the same fault, and though a remarkably free bloomer must be discarded in consequence. Of the pale colours some fine varieties have this season been sent out; a very distinct sort is Ivery's Pet, a small flower, not much larger than a Nierembergia, with a pale ground, the throat pencilled with dark purple, and the edge of the flower beautifully mottled with dark-rose. Magna Charta is a larger flower of the same character, the mottling being distributed over a broader surface; and this mottling is not the result of decay, as is the case with "Miller's Punctata," but is the natural and proper colour of the flower. Reliance has a finely pencilled throat, on a ground of very pale lilac, and slightly edged with purple. Kentish Beauty has a very dark pencilled throat, on a deep lilac ground; and Enchantress has the same character of throat on a rich peach-blossom surface. Ovid is a large flower of superior form, and of a deep purplish-lilac colour. Triumphans, or Rosea alba, has a white flower edged with deep rose. Erubescens is an old but an abundant flowering kind, of a pale lilac colour; and Lady Sale has very delicate pale lilac flowers slightly edged with pale rose. The above are the only varieties which a careful examination of the best metropolitan collections has enabled me to recommend as distinct. They may all be propagated by cuttings, which root freely in a gentle heat; but as they are liable to become long-legged, spring propagated plants are preferable for bedding out.

Flower Garden.—The sowing of Annuals to stand the winter must not be delayed; a light free soil is the most suitable, but it is not desirable to have them in a very sheltered situation. At this place we find them to stand the best when the seeds are scattered over the rockwork.

Bulbs.—Where these are required to be got in for the flower-garden in the spring, no time should be lost in making a selection of them, and it is worth remarking that good bulbs, though they may cost a little more, are very preferable to going to a cheap market and getting indifferent kinds.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Carnations.—As we have before insisted, parties desirous of having layers which will healthily pass through the coming winter, will do well to pot them off as soon as rooted; and where new and fresh varieties are required, the best plan is to see them taken off. Should layers come from a distance, examine that part of the stem which communicated with the parent plant—it will sometimes have a cankered or decayed appearance; this must be carefully removed with a sharp knife, and the stem cut back to where it is healthy. Should there be no appearance of decay the stem must then be cut across at the joint, which will frequently emit fresh roots. As the layers are taken off, the compost in which they have been grown may be turned into the Tulip bed, either as a substitute for that which previously formed the bed, or to ameliorate that which is already there. *Pinks.*—It is now a good time to plant out those intended for flowering on the best bed next year. By putting them out at this season there is a much greater certainty of their coming or blooming in true character next season. Bradley's Duke of Northumberland, Norman's Splendid, Beauty of Weston, Kirtland's Gay Lad, Bunkel's Queen Victoria, and Wilmer's Miss Jones, are worth adding to collections, laciing well and being all "rose-leaved," or nearly so. *Tulips.*—Prepare a bed for offsets; they ought to be in the ground at least a month before the main bulbs are planted. Continue to turn the soil of the best bed at intervals, giving it the benefit of sun and air. *Auriculas.*—Take care to have the frames intended for the reception of these plants properly cleaned, and the broken squares of glass repaired, &c.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—Pines showing fruit after this time, although they cannot be expected to produce as fine fruit as if earlier in the season, will yet be found very useful, and should have every encouragement given them, while the season still continues favourable. The warmest situation in the house should be allotted to them, and when dry they should have a little liquid manure, for the next three or four weeks. Plants that appear likely to show about November or December, if kept at a temperature of 65° or 70°, should have the heat lowered gradually to 60° by night, and 70° by day, which would be just sufficient to keep them from standing still, and would retard their coming up. After the season begins to turn there is a much better chance of swelling off fine fruit. Begin now to lower the temperature for the younger successions, letting the decrease be very gradual. Do not let them want for water, but continue to look them over twice a week, lest any of the plants near the pipes or flues should become too dry. Plant all suckers as soon as taken from the plants, as they soon shrivel by laying out, and are consequently much weakened.

Vineries.—If damp is kept from the late vineries, the damaged berries cut off the bunches, and the ingress of wasps prevented, little else will require attention for some weeks. Where there are not many vineries to protect from wasps, a cheap way is to make bags of tissue paper, to draw up over the bunches, twisting the mouth of the bag round the stalk. If this is carefully performed the bloom need not be injured. I like these bags—they are a cheap, simple, and effectual prevention from insects and dust. Prune the Vines as soon as the leaves fade, and let them be thoroughly cleaned from dust and insects. When this is done let all alterations, repairs, whitewashing, and painting be done, when the houses may be used as greenhouses, till required for forcing. Continue to stop all laterals in the late houses.

Peach-House.—If any fresh trees are to be removed from the walls to the Peach-house, the sooner it is done now the better, as the shifting will check the present season's growth, and the wood will ripen sooner. The tree will make new roots enough this autumn and winter to enable it to produce a good crop next season if of sufficient age. In preparing the place in the Peach-house, remove all the old soil that can be taken away without material injury to the other trees in the house, and fill up with half decayed turf from a rich loamy pasture. No manure need be added. Keep the tree high to allow for sinking, and give a good watering to settle the soil round the roots. Continue to syringe the trees in the late houses, if the leaves are yet firm.

Fig House.—Figs in tubs and pots, still bearing, should be assisted with liquid manure when dry; but in less quantities at a time as the power of the sun declines. It is not well to give much water to the borders as now, as the trees should be induced to ripen and go to rest early.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Peach Trees.—In paying attention to the fruit at this season do not let the trees be forgotten, but take every opportunity for hastening the maturing of the wood. The points of the shoots might now be shortened, and the large leaves on strong shoots cut through the middle. The shortening the shoots will cause the buds left to swell better, and unless the trees receive too much moisture at the roots there will be no danger of the buds then bursting. In extreme cases of luxuriance the stronger roots might be pruned with advantage.—*Wasps* are now getting extremely troublesome, after we began to think ourselves secure from their ravages. Every means must be resorted to to keep them in check, by covering with gauze, &c., but even then they will often discover a cranny by which they may enter. For fine single fruit nothing is better than wrapping them round thinly with wool, or cotton wadding; and Grapes that are worth preserving should be bagged at once.

Tomatoes will now require considerable attention to get the fruit well ripened, by stopping the shoots, and cutting off the leaves very liberally, so as to expose the fruit fully to the sun. *Onions* should now be dried and got off the ground as soon as possible; and the ground well dug, with the addition of a little dung, will furnish a suitable place for the main plantation of Spring Cabbages, which had better be got in without much further delay. The last crop of Autumn sown Onions, and the last sowing of Lettuces may also now be made. *Small Salads.*—We have seldom alluded to these, as where they are in demand, the sowing of them is a weekly occurrence. Normandy and American Cress may now be sown for the Winter. *Kidney Beans.*—A quantity of the Early Dun, Cream-coloured, or Speckled Dwarf China, may be sown in pots in a warm place, to perfect their produce under the protection of a frame or pit afterwards. No more need be sown, where the plants cannot have the advantage of fire-heat. *Mushroom-house.*—There is little difficulty in procuring Mushrooms after this period, until May next season, in houses where a sufficiency of heat can be commanded by artificial means; such as thick covering, fermenting material inside the house, or flue or hot-water pipes. If in a house with shelves, upon the Oldacre system, the depth of the bed must be regulated by the quantity of materials at your command, and the period you expect them to produce. A bed of 5 or 6 inches thickness of dung may be ex-

* "Notes on Nets."

pected to produce for six weeks; and, as I am scarce of material, as soon as a bed finishes bearing profusely, the top part is removed, fresh droppings added to the depth of two other inches, the old and the new mixed together, spawned, and earthed at the proper time—the same as in a fresh bed. It is not of much consequence whether the material of the bed is rather dry or rather wet; only in the first case, after spawning, a covering of wet cow or horse-dung is added, and in the second case, the spawn should be wrapped in a handful of dry litter before being inserted. In all shallow beds, the earth should be put on after spawning as soon as the state of the bed will permit, regulating the thickness of the earth from 1 to 2½ inches, according to the thickness of the bed, and the time you expect them to produce; as, the thinner your covering of earth, the sooner will you obtain Mushrooms,—at the expense, in general, of solidity in the Mushroom, and permanence in the crop. Both with in-door and out-door beds the heat should be rather on the decline, and just about milk-warm, before spawning; and then if, after earthing-up, the heat should not be sufficient, you may throw what you wish into the bed by covering. Before you could remedy too much heat, the spawn is worthless.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—Proceed with preparations for fresh planting, if any is to be done during the ensuing season, by clearing the ground of any useless shrubs, such as Briars, Thorns, Furze, &c. Trench and hole the ground where any additions are to be made.

Coppice.—Refer to last week's *Chronicle*, and attend to what is wanted to be done at this season. Remove any useless stuff, where something more profitable may be substituted.

Young Plantations.—Attend to former directions. Too much attention cannot well be paid to these where it is wished to have them profitable, as well as creditable to the owner and to the person intrusted with the management of them.

Hedge-rows.—Make ready for fresh planting, if required. Filling up the places where trees have died should be proceeded with at every opportunity.

Nursery Work.—The most important work at this time is eradicating all weeds as they appear—they make great progress in a little time at this season. Train the leading shoots of the plants until they have done growing for the season, and pinch off the ends of the strongest side-shoots that extend too far from the stem.—*W. B.*

VII.—COTTAGERS' GARDENS.

The principal operations to which attention is now to be directed are the protecting of Grapes and the gathering of fruit. The Grapes, which should now be swelling fast, had better be put into small gauze bags, to preserve them from the attacks of wasps, &c., which are now troublesome. With regard to the gathering of fruit, such as Apples and Pears—the sorts that Cottagers generally cultivate—great care is necessary to keep them from being bruised. They should be handled like eggs, in order to insure their keeping. The time when the fruit is ready for gathering is indicated by its beginning to drop of its own accord from the trees, by its parting freely from the stem on being slightly moved, or if, on cutting open one of the fruit, the seeds are of a dark-brown colour, it is fit for gathering. In performing this operation, however, the fruit should never be shaken from the trees, as is often done, but it should be all hand-picked on a dry day. In storing it, let it be taken from the basket, and placed where it is to remain with great care; and, if possible, let it be arranged side by side, and not placed one upon another. With respect to Vegetables, look over the seed-beds, and keep them clear of weeds. Onions, if not already done, should now be dried and stored as soon as possible, in order that the ground may be got ready for other crops. Owing to the late favourable weather, the flower-borders still maintain much of their beauty. Scarlet Pelargoniums are in fine condition; and I have lately seen in the open ground some noble bushes of Fuchsia Riccartonii in luxuriant health, and loaded with blossoms. This is an excellent border variety; it is a very profuse bloomer, and may be easily kept over winter by covering the root with a little litter or leaf-mould, so as to keep out frost. Herbaceous plants that are done flowering should be cut down, and have their stems removed whenever they become unsightly. Dahlias, on the contrary, that are still in fine bloom should be trimmed and tied up. If the ground is weedy, run the hoe through it, and endeavour to keep the whole as neat and clean as possible.—*J. M'H.*

State of the Weather near London for the week ending Sept 12, 1844, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

ASPARAGUS.—*A Subscriber.*—Consult a letter from Mr. Bree in to-day's Paper.

BRAZILIAN BEET.—*Toby.*—We shall be much obliged.‡

BULBS.—*Flora.*—Grow the hardy bulbs in a good peat border, in which there is a tolerable proportion of loam. All the tender ones must be planted in loam and kept from too much sunshine, in a well-ventilated greenhouse. We cannot go into details, for each of your 40 sorts would require a separate set of directions, for which we have no room; nor indeed can we undertake to answer such a crowd of questions.

CANKER.—*R., Clapham.*—There is no known remedy for canker in Apple trees. Some varieties are more subject to it than others, and in some soils it is induced on every variety planted in them. Wood that is produced in wet cold seasons is apt to canker in succeeding years. If it is owing to the variety, this may be changed; if the soil is the cause, endeavours must be made to better it. Lime will probably do good. Shoots produced in a bad summer should be well shortened in, and the diseased parts of the old branches should be cut out. Your method of numbering Labels is the old well known plan.‡

CARNATIONS.—You will find lists of Carnations in No. 9, p. 136, and in No. 33, p. 560, of the present year, from which you can select the number you require; and a list of Polyanthus also, No. 9, p. 136.*

COPPICE SHOW.—*C. W., York.*—The Judges at this Show placed several seedlings which, owing to informality on the part of the exhibitor, did not receive a prize. We especially noticed a scarlet bizarre, a noble striking flower; it had, however, a very slight serrature on the edge of the petals, but we should say it is better than two-thirds of the varieties comprising that class. The scarlet flake was also fine; white, good, high coloured, and the petals of good texture and well ribboned. A purple flake, we understood a seedling from Ely's Mango, had all the good properties of that esteemed flower, with a darker stripe. *W.*

CINERARIAS.—*C. K.*—You will find an excellent variety in the following 12 sorts, viz.: Eclipse, Rival King, Victoria Regina, Triumph, Goodeii, Emperor, Red Rover, Black Knight, Fanny Elsler, Captivation, Compacta, and Criterion.*

CYPRIPEDIUMS.—*A. H.*—We believe the secret of keeping these in health is to preserve them during winter in a frame whence frost and wet are excluded. They like peat. Upon the management of the bee and spider Ophrys we regret to say we have no information. Perhaps some correspondent has.

EVERGREENS.—*C. R. D.*—Cut down your bushes in the beginning of April; and serve them all alike.

FRUIT.—*J. B.*—The maturity of fruit is influenced by so many different circumstances, such as soil, elevation, aspect, and latitude, that every one must be his own adviser on that point. To give weekly directions would only mislead.

FUCHSIAS.—*M.M G., F.H.S.*—Procure the following 12 sorts: F. Exoniensis, Formosa elegans, Epp's Kentish Bride, Smith's Vesta, Robusta, Bell's Queen, Conspicua arborea, Pride of Peckham, Youell's Queen Victoria and Countess Tyrconnel, Halley's Sanguinea, and Standish's Candidate.*

HEATING.—*T. E F.*—The circulation of water is the same, whether the flow-pipe is quite full or not.——*A Subscriber.*—You are right in having plenty of water: we cannot, however, recommend you to construct your hot-water tank of bricks and cement; for it is found in practice almost impossible to prevent the joints breaking, in consequence of expansion and contraction; unless, indeed, the tanks are constantly filled with hot water, in which case they will probably stand. By all means have some pipe in addition, and manage, by means of a stop-cock, to heat them or not, as you please. A second-sized boiler will do.

HERBACEOUS PLANTS.—*O. G.*—The following are 12 handsome and rather new hardy sorts:—1, Aquilegia fragrans; 2, Statice pseudo-armeria; 3, Campanula grandis; 4, Cynoglossum longiflorum; 5, Sedum Sieboldii; 6, Epimedium macranthum; 7, Hoteia japonica; 8, Phlox Van Houttei; 9, Salvia hians; 10, Potentilla insignis; 11, Pentstemon crassifolium; and 12, Anemone vitifolia.¶

HORTICULTURAL SOCIETY.—*An Exhibitor.*—We cannot insert letters at a moment's notice; yours will appear next week.

INSECTS.—*x. λ, σ.*—There is a Clover weevil, but we should feel obliged by your sending Mr. Curtis some of the injured leaves and specimens of the insects alive with them in a small box. *R.*——*N. Esk.*—If you will favour Mr. Curtis with a portion of a Melon-leaf and some of the leaping insects, in a box protected from pressure, your queries will be attended to; but the leaf was so dry and matted together that it was impossible to find anything. He would also like to see the insects injuring the Calceolarias.——*T.*—The destructive grubs you sent are the offspring of a moth called Noctua exclamationis, whose history is given in our columns of this day. *R.*——*C. J.*—Your caterpillar, it is expected, will produce a Saw-fly, called Trichiosoma Lucorum, but in future we beg that with inquiries you will favour us with specimens. *R.*——*W. H. R.*—From your interesting letter we are inclined to believe that your Wasp's nest is the work of Vespa Britannica, vide "Curtis's Brit. Ent.," fol. 760. Mr. Gray, of the British Museum, will inform you if the specimen would be acceptable. *R.*——*John Cot.*—Your beautiful larva is the Privet caterpillar, and will produce Sphynx Ligustri. *R.*——*J. M.*—One of your insects is the young larva of a Lady-bird, lately figured and described in this Journal; the other is too much injured to decide upon its name. It may be the larva of a small moth. We cannot advise you how to exterminate the Rose maggots, but if our correspondents will furnish us with sufficient materials in the spring, we will turn our attention to the subject. *R.*——*C. B.*—It is generally impossible to give advice regarding Melon plants, for without examining them we are often unable to ascertain whether the mischief arises from atmosphere or insects. *R.*——*Q. Q. Q.*—The caterpillar last sent will change to a moth, called Spilosoma lubricipeda, figured and described in the 1st vol. of the *Gardeners' Chronicle*, p. 700. *R.*

LAVENDER.—*A Subscriber.*—If your ground is in readiness, and plants at hand, they may be put in with advantage now. The distance between the rows should be two feet, and the plants in the row should stand about one foot apart. If, however, the ground is not in readiness, you had better defer planting till spring. The soil in that event, if wet, should now be well drained, and laid up in ridges to be exposed to the action of the weather, until about the end of March or beginning of April, when the ridges may be levelled down, some well decayed manure dug in, and the Lavender planted. The best plants are those raised from seeds. It likes a light dry soil.‡

NAMES OF FRUITS.—*Tyro.*—Your Cherry, called the August Heart, has not been found under any other name. Some Correspondent will probably afford information regarding its locality, and where plants of it may be obtained.‖——*J. W.*—Black Morocco Grape.‖——*C. C.*—1 and 3, Hawthornden; 2, Old English Codlin; 4, Pomme de Neige. Plums, 1, Diamond; 2, Coe's Golden Drop; 3, Blue Imperatrice. Pears: 1 and 3, Jargonelle; 2, Beurré de Capiaumont, of some, but not the true one.‖——*G. B.*—1, 2, 4, 9, Royal George; 5, 8, Grosse Mignonne; 6, Red Magdalen (of Miller); the Nectarine, No. 3, is the Elruge. The specimens were fine.‖——*H. W. B.*—No. 1, Yellow Ingestrie; 2, Summer Pearmain (of some); 3, Court of Wick; 4, Ribston Pippin.‖——*R. M. K.*—No. 1, Henri the Fourth Pear. Plums: 2, Purple Gage; 3, Wine-sour; 4, bruised—probably the Nectarine Plum. Apple: Beauty of Kent.‖

NAMES OF PLANTS.—*F. J. Z.*—Apparently Cuscuta chilensis, which will soon strangle everything that comes in its way.——*J.C.*—Your fragments seem to belong to Eutoca viscida.

PELARGONIUMS.—*J. R.*—To your collection you may add the following:—viz.: Sultana, Lord Chancellor, Luna, Queen Phillipa, Hodge's Oberon, Beck's Susanna, Unit, Hoyle's Titus, and Pompey, and Lyne's Imogene. A very few of your sorts may be discarded; these will suggest themselves. Some of the high-coloured varieties, although not good in shape, are useful in adding splendour to the general effect, and should be kept till others are produced of the same colour, with finer properties. The list of flowers in your postscript we cannot recommend, as your taste lies in an opposite direction. The growers' lists not being all published, we may have to add to the above list.*

PETUNIA.—*M.M.G.*—A variety named Medora. Calceolarias are so numerous that it is impossible to answer your question.*

PLANTS AND TREES.—*J. M. S.*—The following trees and shrubs are suitable for planting on an elevated situation, near the sea, in the south of Devon:—Leycesteria formosa, Spiræa ariæfolia, bella, and cuneifolia; Hydrangea hortensis, Arbutus procera and others; Berberis aquifolium and fascicularis; Alnus cordata, Quercus cerris, Fulham, Ilex, coccinea, and sessiliflora; Ulmus vegeta, rubra, nigra, and stricta; Cratægus Douglassi, orientalis, prunifolia, and Aronia; Garrya elliptica, Hippophae conferta, Cytisus alpinus, Magnolia grandiflora and conspicua; Pinus pinaster, insignis, and pinea; Abies deodara and canadensis; Aucuba Japonica, Ailantus glandulosa, Syringa persica, and the common Lilac.¶

ROSES.—*A. P. B.*—Any of the great Rose-growers will tell you better than we can, what are the best Roses to grow for competition. You had better send your order to them with no other directions except as to the climate they have to be exposed to.

SEEDLINGS.—*J. N. C.*—Your double Canterbury Bell has nothing remarkable about it.——*A. C.*—Your seedlings are between Achimenes rosea and coccinea; they are pretty, but not very distinct, and we do not attach importance to them.——*J. D.*—Your Achimenes is too much like coccinea; it would not improve much by having a larger pot.

STRAWBERRIES.—*G.*—Give your Strawberries a good top-dressing of guano, mixed with six times its bulk of light soil in the end of February. If good it is suitable to them.

THE VINE.—*N. B.*—There is no good or even tolerable analysis of this plant. The nearest approximations to a good one are those of Geiger and Proust, but they are vague and incomplete.

THUNBERGIAS.—*O.*—These are stove plants, and do not succeed well in a greenhouse. If they are not grown in a warm moist atmosphere, they either become stunted or are attacked by red-spider.§

TOBACCO.—*Alpha.*—In order to cure Tobacco, so as to render it most effectual for the destruction of insects, it is not sufficient that the leaves be taken off and merely dried like specimens. Liebig states, that in the process of curing, the addition of water is necessary for the formation of that peculiar oil to which the virtue of the article is attributable. He also mentions fermentation; but if this be at all allowed, it must be in an extremely slight degree, otherwise the article is materially wasted in quantity, whilst the quality is rendered decidedly bad. When mature, the leaves slightly yellow, pull up your plants, or cut them very close by the roots, hang them by the root end in a dry place, without stripping off the leaves. In a day or two they will occupy less space, and should then be kept in a heat of 70° or 80°, till even the midribs of the leaves are dried up, and the leaves in the state in which they would easily crumble to snuff. They are very absorbent, and by wetting the floor and otherwise damping the situation very much, the leaves will soon acquire the quantity of water absolutely necessary for the only formation above alluded to. After several days, drying may be again commenced, and continued till such time as the leaves are considerably dried, yet still retaining sufficient pliability to admit of their being stripped from the stems without breaking. They should then be spread out flat above each other, in handfuls, pressed, then finally well dried, and packed up close till required for use. Thus managed, you will find it superior in quality to much of the imported Tobacco, for the destruction of insects on wall-trees, &c. It is impossible to say how much of the imported Tobacco is rendered inferior, of a burned foxy colour, in consequence of improper fermentation, and of water not being supplied during the process of curing.‖

TULIPS.—*N. N. P.*—Three Bizarres: Polyphemus, Charbonier Noir, and Catafalque. There is no method of getting a speedy increase of bulbs. There are no plates of these flowers.*

VINES.—*A .B.*—As soon as the Fruit is cut you may remove as much of the old wood as will admit sufficient air and light for the maturity of the young wood.*

WASPS.—*L. Short.*—If you know of a better way of destroying these creatures than by turpentine, pray say what it is. We doubt the possibility of anything being more effectual. But why do at three different times what may be done so easily at once?

MISCELLANEOUS.—*X. A.*—Achimenes longiflora cannot be grown to any good purpose in an open border. You cannot make a fountain without a head of water or some good mechanical contrivance for producing the requisite pressure. The little self-acting fountains are the most childish things imaginable. A heavy rain extinguishes them.——*Omega.*—The ordinary allowance of labour is a man to an acre. For what is called a single-handed place, you may get a man for a guinea a week. Sashes for frames are usually 3 feet 8 inches broad, and 6 feet long. If your pits are sunk they will be more easily kept warm; but then, if the soil is not well drained they are apt to be damp. By all means heat them with some sort of apparatus; of which the sort will depend upon the purpose to which you mean to apply them. You will find many statements respecting that subject in our previous Numbers. Glaze with sheet glass; it is rather expensive, but much the cheapest.——*M. M. G.*—For the pronunciation of Dahlia refer to vol. ii. p. 737.*——*D. J.*—If your object is to procure double flowers, rid your bed of the single ones.*——*N. N. P.*—Double Pansies are not worth cultivating.*——*A. G.* is answered in another column.‡——*A. C.*—We have not received the parcel you mention.‡

SEEDLING FLOWERS.

DAHLIAS.—*F. and A. S.*—Your seedling *Lady Sale* is a promising flower—a bright-yellow regularly tipped with crimson; it is novel in colour and good in form. The centre is well up, but the bloom sent was too young to judge whether this part of the flower developes itself sufficiently.*

FUCHSIAS.—*T. F.*—Your seedling is an elegantly-formed flower, with fine violet corolla, but it differs too slightly from other varieties in cultivation.*——*J. M.*—Your seedlings were not only bruised and damaged by their journey, but the labels were all torn from the flowers, so that it is impossible to determine to which they belong; some of the light-coloured varieties are very pretty, but they are very much discoloured, from being so much bruised.*——*Anon.*—Three seedlings, which are fair flowers, but not possessing novelty sufficient to send out. No. 2, which is the best, is disfigured by having very long and narrow sepals; in other respects it is good, as the tube and sepals are of a transparent and delicate pink, with a deep vermilion corolla: 3 too much resembles others in cultivation; and No. 1, which is a good stout flower, has the same fault.*——*A Kentish Florist.*—Your four seedlings are all good flowers, but they too much resemble each other; 3 and 4 have slightly the advantage, being the brightest and most distinct, and having also the best-formed corollas.*——*J. N. C.*—Nos. 1 and 4 are large, rich-coloured flowers, but the sepals of both are coarse. No. 3 is pretty, but none of them are equal to sorts in cultivation.*

PETUNIAS.—*J. A.*—The best flower among the Seedlings sent is No. 2; light lavender, with dark purple veins; 1 and 3 are common and colourless; 4 is a very fine colour, but too small.*

VERBENAS.—*W. G.*—Your seedling is a good flower, colour crimson maroon, and though it strongly resembles some of the varieties out, from its size and manner of opening, it is equal to any of the same colour.*

PANSIES.—*J—n.*—It is impossible to tell the merits of a flower when sent folded up in paper; it becomes dry and discoloured by the time it reaches us. The centre appears to want distinctness, and the petals substance.*——*A Subscriber.*—No. 22 is a very pretty flower in its young state, fine in form and good in substance; but when fully expanded the margin round the side petals becomes weak and watery, especially in the upper part, where it unites with the ground colour; the eye is also insufficiently marked on the side petals, which shows more in the larger bloom. It is a flower of fine form, but deficient in the points we have mentioned. 5 is not so fine in form as 22, but it is of good substance, flat, clean, and good in colour, with a very fine eye.*

PICOTEES.—*Leitrimea.*—Your seedling is pretty in colour, but the petals are too small in size and few in number.*

VERBENAS.—*W. M.*—No. 1 was too much decayed to judge of, the true colour of the flower could not be seen; the pink variety, No. 140, is of a beautiful tint, clear, and lively.*

SEED-WHEAT. — Any one desirous of obtaining Seed-Wheat for use this autumn, may ascertain, by application to me, the particulars of the crops of two excellent varieties—Shirreff's Hopetoun, and Morton's Red-Straw White, which have been grown on

WHITFIELD FARM, THORNBURY, GLOUCESTERSHIRE, during the last 3 years. This year's crop is on sale at 8*s.* a bushel. —JOHN MORTON, Whitfield.

TO AGRICULTURISTS.

CAMPBELL'S CORN STEEPS.—The Material for Wheat is on Sale by the undermentioned Agents, at 2*s.* 6*d.* per gallon.

Notwithstanding the extreme drought of the last spring and summer, the results of the experiments, in very many instances, have been surprising, averaging a saving on seed, in the first instance, of 3*s.* per acre, and yielding a produce of 20 per cent. additional in straw, and 40 per cent. in grain. Had the season been more moist the result would have been at least double

From Report of the Judges, Glasgow Cattle Show, Aug. 7, 1844.

"Among the remaining articles of the Exhibition (of Roots, Seeds, &c.), the Judges would direct attention to a series of specimens exhibited by Mr. James Campbell, of Dundee, consisting of various Grasses (they were Wheat, Barley, Naked Barley, and Oats), raised from Seed steeped in a Fertilising Liquid. These were contrasted with others which had not undergone the process, and were in all cases decidedly superior."

Agents:—Messrs. G. Gibbs, 26, Down-street, Piccadilly; Thos. Gibbs, corner of Half-moon-street, Piccadilly; and Edw. Purser, 40, New Bridge-street, London. W. E. Rendle, Plymouth Manure Company; J. Campbell, 5, Mersey-street, Liverpool; P. Bruce, Merchant, Hull; Crouch and Co., 66, Close, Newcastle-on-Tyne; W. F. Karkeek, Truro; John Mayer, High Offley, Staffordshire; George Griffith, Bewdley; J. B. Haden, Warminster; Phillips and Whittem, Coventry; John Towers, Maidenhead; Samuel Waldie, Carlisle; John Rodway, Carmarthen; James Black and Co., Aberdeen; W. Campbell, Merchant, Wick; Wm. Cuthbertson, Printer, Annan; J. and D. Campbell, Thurso; Maxwell Dick, Irvine; Dickson and Turnbull, Perth; Drysdale and Co., Glasgow; Drummond and Sons, Stirling; Wm. Dalrymple, Cupar Angus; John Dykes, Kilmarnock; James Haldane, Lauder; J. Bell, Dundee; Thos. Kennedy, Dumfries; A. Kennedy, Thornhill; P. Lawson and Son, Edinburgh; Wm. Low, Forfar; A. M'Farlane, Kinross; John Ogg, and Shield and Co., Arbroath; Geo. Robertson, jun., Kirkwall; John Rae, Ellon; A. Simpson, Macduff; A. B. Telfer, Ayr; Wood and Co., Stonehaven.

The Agricultural Gazette.

SATURDAY, SEPTEMBER 14, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

FARMERS' CLUBS.

Sept. 20—Debenham, Stoke Ferry, Wrentham.
Sept. 21—Cardiff, Gloucester.
Sept. 23—West Hereford, W. Firle, Fairford, W. Market, Yoxford.
Sept. 24—Framlingham, Isle of Thanet, Rayleigh.
Sept. 26—Richmondshire.
Sept. 27—Halesworth.

THE month of August is the gala month of British Agriculture. To those who would estimate its resources, its capital, energy, and skill, no season is so favourable; for the success arising from their application is at this period evidenced both in the golden maturity of our crops, and in the splendid Exhibitions of stock and mechanical ingenuity which OUR THREE NATIONAL SOCIETIES afford us.

Not only do the Exhibitions of these Societies promote improvement in stock and machinery, but indirectly they cannot fail to diffuse agricultural knowledge and improvement in general. For can it be supposed that great numbers of persons, from all parts of the empire, can be brought together at a season when the success or failure of the previous year's operations are written on the face of the country, in a language so plain that he who runs may read, without much information being received? And we cannot suppose that, coming as they do with minds ready to criticise what they see and hear, men of science, practice, and capital, can associate without much that is useful being conceived and propounded. From these considerations, therefore, it is obvious that the results of our Annual Agricultural Meetings constitute a meter by which may be indicated to us the intensity of that energy in agricultural improvement which has already done so much for the country. One pleasing feature developed at these meetings promises us important results, viz., the desire which was everywhere apparent to seize the opportunity presented by the assemblage of scientific men, in order to unite scientific knowledge and practical skill in the investigation of subjects of agricultural interest. And the necessity for such an investigation exists all the more, because the results of discussions at Glasgow simply prove our entire ignorance of many of them. It is thus alone that we may expect improved methods of culture to be made known, the causes of failure in our crops to be ascertained, prejudices to be removed, knowledge to be diffused, and a spirit of observation and inquiry to be encouraged.

The actual results of the meetings alluded to are, however, the best illustrations of what may be expected. Thus, at the Glasgow meeting "the best means of making Science promote the Practice of Agriculture," and "the Causes of the Failure of the Potato-crop," were discussed; and at the Southampton meeting of the Agricultural Society of England, and at the Irish Society's Show at Dublin, the subjects of "Agricultural Education;" of "the Best Description of Stock for special purposes;" and of "the Cultivation of Flax," were respectively mooted. The first of these is a matter of general and permanent interest. We have already seen morasses, waste lands, and heaths, converted, by its aid, into golden corn-fields and profitable pastures. Heather has given place to the Oak, and the rabbit to the sheep.

The cause of the failure of the Potato-plant, again, on account of the money value of the crop, is a question of immediate importance. At the present time especially, when that failure has been so general throughout the country, and when, in addition, the Hay and the Red Clover crop have also failed, and when, as report says, the Turnips are failing, it is worthy of most anxious investigation.

In estimating the importance of a knowledge of the *specific* qualities of stock, we must look only to two products—beef or milk, mutton or wool;—and some of our purest breeds of stock, and certainly of our multitudinous crosses, must be inferior to others in both these respects. The breeding and grazing of such is therefore a loss which might be prevented. The cultivation of Flax also—the subject introduced at the Dublin meeting—is not uninteresting to us. It has been shown to be a crop worthy of a place in the rotation of a judicious farmer on good soils; and to the farmer of poor lands, as well as to all, its cultivation is of consequence, for it provides us with Linseed-cake, one of the best substitutes for our green crops in a season like the present, and a most excellent fattening food in any season.

At present, of course, we cannot give even an outline of the information brought to bear on the subjects alluded to. Each is worthy of extended consideration. Our object now is merely to call attention to these discussions, as they indicate the existence and activity of a spirit of improvement, and as they evidence a power which our Agricultural Societies possess of promoting the progress of the science, and the practice of the art; and should the spirit of research and observation which was excited be the only result of these proceedings, that power will not be ineffective. "Let us," said Mr. Alexander, at the Glasgow meeting, "go home, and put in force the various suggestions we have heard; a little labour will enable us to test many opinions, and a little time put us in possession of a great amount of knowledge." The sentiment was unanimously applauded and appropriated. With this spirit abroad, can we fail to learn that from which safely to deduce principles whereby our practice may be regulated?

Let us, however, suggest that if it be intended to adopt the discussion of any question on a future occasion, the subject should be publicly announced, and our local clubs recommended to take it into consideration. The experience of the whole country would thus be brought to bear upon it, and the matter would be thoroughly sifted. In carrying out this design, instead of mingling argument with conviviality, and trusting to one or two speakers for information on any subject they may select, as is the case at our English Society's meetings, we would advise the adoption of the method practised at the Highland Society's Show at Glasgow, which is, to have public breakfasts, at which questions may be discussed, and information given or received by any one who may think proper to attend; these interfere neither with the duties of the day nor the pleasures of the evening. Anniversary dinners are unfitted as times for the discussion of business questions; after-dinner hours are as essentially the hours of relaxation and amusement amongst Englishmen as those before that period are of business and reflection.

On the strength of this peculiarity our Continental neighbours term us a "dining race:" and thus it cannot be expected that a concourse of Englishmen, with spirits elevated, can settle themselves down, contrary to their wont, after a day of pleasing toil, to the calm discussion of difficult questions. From neglecting these considerations many discussions at agricultural dinners have failed; and the extraordinary *éclat* with which those of the Highland Society went off during the last meeting, are undoubtedly to be attributed to the arrangement we now recommend —an arrangement which, by *discussing business at business hours*, does not oppose itself to the customs of society, but, on the contrary, enlists them in its service.

This lesson will, we trust, not be lost; it is not the first which we have with advantage derived from the experience of the *parent* Society beyond the Tweed. —*H.*

SEVERAL complaints have lately been made by Correspondents of the ravages of that extremely injurious parasitic plant—THE CLOVER DODDER. Many such complaints were made at this season last year, and they elicited from the scientific and practical readers of the *Gardeners' Chronicle* much useful information, from which, according to our last week's promise, we now proceed to make a few extracts. In the Number for Sept. 9, DR. LINDLEY writes as follows:—

"As soon as the seed of the Dodder is ripe, it falls to the ground, and usually seems to lie dormant till the succeeding year. When the spring returns, the embryo sends one end down into the earth to form a root, and with the other it rises upwards, like a small white thread or worm. At this time it is not a parasite, but seems to derive its food from the soil, like ordinary plants. It cannot, however, do so long, but withers and perishes, unless it touches some living branch or stem. If it succeed in doing so, it immediately seizes the live stem by means of a sucker, which is protruded from the point of contact; and then, twining from left to right, and forming more suckers as it twines, it establishes itself on its victim, and ceases to have any further connexion with the soil. From that time forward it is a true parasite, feeding on the juices of the plant it has seized upon. After making a few turns round the branch, and securing itself firmly in its new position, it again lengthens, and catches hold of some other branch, when more suckers are protruded; and thus it goes on—branching, and twining, and sucking, and branching again—until it forms that appearance which Professor Henslow well describes as resembling 'fine, closely-tangled, wet catgut.' Now the Dodder has a new and independent seat of life wherever it has twined round a branch; and as it is incessantly twining and separating, and twining again, a single plant is speedily in the condition of a polype—so that if it be cut into a thousand pieces, each piece will immediately go on growing, as if nothing had happened to it. Tearing the Dodder to pieces, then, so far from extirpating it, only multiplies the mischief, instead of arresting it.

"This short statement will show that it is a formidable enemy that has been thus unfortunately introduced to our fields; and, as these things are not very nice in their food, it is not impossible that the Clover Dodder may next take a fancy to our Wheat-fields, unless we can speedily put an end to its presence. It is of little use to cut it in pieces,—it is of no use whatever to do so, if the fragments are left where they can catch hold of anything else.

"As it is only an annual, it would be killed if we could prevent its flowering; but that is difficult, because of its hiding itself among the lower branches of plants, where it cannot well be seen: and a few heads of flowers will soon renew it in a succeeding year. The right plan would be to dig up the Clover where the Dodder appears, so as to form a circle considerably beyond the patch apparently formed by it, and then to burn it in heaps; or, in cases where the entire field is infected by it, to sacrifice the whole crop, and burn it. This may appear a violent remedy, but it is the only one likely to be effectual; and even this will fail, if (which is not yet the case, but soon will be) the Dodder is allowed to form its seed: for, they will fall on the ground, lie hid in the crevices, and reappear with the next crop,—when all the labour will have to be done over again."

The following remarks on the rapidity of its growth are by PROFESSOR HENSLOW:—

"I find one of the patches, which I stated to be two yards in diameter three weeks ago, is now six yards in diameter, which gives us a ninefold increase in area. The mere raking which this patch had received appears to have promoted the spread of the Cuscuta, possibly by having retarded the development of the flowers, and by thus fitting the numerous fragments left upon the Clover for making independent and more vigorous shoots. Another patch is now a perfect mass of cream-white flowers, upon which a number of flies have stationed themselves, in seeming enjoyment of the succulency of the heads of flowers. As you have thrown out a suggestion that this Cuscuta may possibly become a future pest in our Corn-fields, unless it shall be timely checked, I directed my attention to the plants upon which it is now growing, and I observed it was attached to and evidently attacking the following species:—Geranium dissectum, Daucus carota, Carduus arvensis, Euphorbia exigua, Viola tricolor, Malva sylvestris, Linaria spuria, Senecio vulgaris, Medicago lupulina, Alopecurus arvensis, and another Grass, which seemed to be Agrostis vulgaris."

The seed of this plant appears to have been imported from Cabul along with the seed of Trefoil. The following is an extract from the communication of a correspondent, with remarks by DR. LINDLEY:—

"I have the pleasure of sending you a packet *in the state in which it was purchased at a bazaar* with that which produced the Cuscuta above mentioned. Close examination may possibly detect the seeds of the parasite mixed with those of the Trefoil."

We have carefully examined the seed alluded to in the foregoing letter, and we are able to state that the seed of Cuscuta trifolii was in it. Out of a small packet we have picked *thirteen* seeds, each with its snake-like embryo perfectly alive and fit for growth.

We are also enabled to state something more important; namely, that the Dodder-seed may be readily separated by sifting. Lucerne-seeds are about 2 lines long and 1¼ broad. Clover-seed is much the same; the Dodder-seed is spheroidal, and scarcely a line in diameter. It is of a pale-grey colour, in form like the quarter of an Orange, and looks more like fragments of grey clay than an organised body.

In a subsequent paper we are informed that Dodder seed may be separated from Clover-seed by the use of the sieves called No. 17.

From the information thus accumulated, it appears that the existence of this weed in our Clover-fields is matter of serious importance. Those who have the misfortune to be attacked by it ought to place the spots where it has made its appearance under the strictest quarantine. Let them act upon Dr. Lindley's

advice, dig the land round the isolated patches to hinder it spreading further, and then carefully pare and burn the patches themselves.

ON FLAX-SEED AS FOOD.

(*Concluded from page 610.*)

Flax-seed, it has been already observed, is applied to the feeding of the various animals on the farm at Horkesley Hall, in the manner above described—a steaming apparatus having been recently erected there, instead of a common boiler, formerly employed. The arrangement of the houses and sheds for using the Flax-seed compound does not materially differ from that adopted at all the improved farmeries for stall-feeding. It is merely necessary to provide simple and convenient troughs to contain the food, which admit of being washed out with facility, to keep them sweet; and further, to provide a dry and comfortable bed for the animals. When fed on this compound, the quantity of urine will not, however, be so great as when Turnips are used; but the manure made when feeding on it is superior to that produced from any other kind of food. According to Mr. Blair Warren's arrangements, the liquid manure is not separated from the more solid matters, and hence no tank or reservoir is necessary for its reception. The sheds and other apartments in which animals are fed in this manner are slightly excavated, and in these the manure accumulates for weeks, fresh additions of litter being made as they are required. The troughs in which the food and water are supplied are of course fixtures, but arrangements are made for raising or depressing them, by means of a sliding groove, so that as the manure accumulates the troughs can be raised to the height most convenient for feeding from, and after the boxes are cleared out, the troughs are again lowered with facility. The treading of the animals prevents any considerable degree of fermentation from taking place until the manure is removed to the heap, and small quantities of finely-powdered gypsum are sprinkled over the surface, to prevent the escape of any ammoniacal gas which may be disengaged. This may appear to many a slovenly system of management, and one calculated to maintain the animals in a foul atmosphere; but such is certainly not the case. The manure thus produced, taking both the nutritious quality of the food and the plan of storing it into account, is the most valuable which can be conceived. The attention which is paid to properly littering the animals, and to prevent the formation of gaseous exhalations, effectually guards against the presence of any unpleasant smell. These circumstances it is particularly necessary to allude to, as Mr. Blair Warren conceives the increase in quantity, and improvement in the quality of the manure, which is effected by means of the system he follows, as important features in estimating its value; which they confessedly are. The smallest particle of liquid matters is not allowed to flow from the yards, and still the state of the manure at its removal does not indicate the slightest appearance of any excess in this respect. The animals have a perfectly dry bed; and cattle-sheds more free from any noxious effluvia than those now described cannot be conceived. At the period of the removal of the manure from the sheds, powdered gypsum is liberally employed in being sprinkled over it as it is freshly turned up, and by these means it is applied to the soil without being deprived of any of its fertilising properties.

There is, perhaps, no animal of the farm to which confinement in houses or sheds has been considered more unsuitable than the sheep, whether the inaptitude to take on flesh under such treatment, or the supposed tendency to become diseased is considered; but the success which has attended Mr. Blair Warren's management in this respect shows that such opinion is not well founded. A portion of his sheep get an allowance of compound, formed as already directed, on their pastures, and others are supplied with their food in the houses, in which they are divided into lots of half-a-dozen each, when they put on flesh rapidly, being littered with Bean or other straw, which they convert into excellent manure. No arrangements are necessary in their case for carrying off any portion of their urine, which is absorbed by the litter, and adds to its value as manure. They are supplied with this compound four times a day, about a ¾lb. of linseed and 2¾lbs. of inferior grain being given to each animal in the twenty-four hours. During the summer months sheep may be advantageously fattened, penned on their pastures; but when the weather becomes cold they should be removed to the houses, to protect them from the vicissitudes of the weather, the injurious effects of which, as retarding the acquirement of flesh, I have already noticed in recent papers on the subject in the *Agricultural Gazette*. Even during the months of summer it has been ascertained that sheep may be successfully fattened in close houses, being there habituated to a greater uniformity of temperature than when in the fields—protected alike from the oppressive heat of the noon-day sun, and from the colds of the night.

The compound now under notice forms an equally valuable food for horses as for cattle and sheep, and is more highly relished by them than any other food which can be given them. Advantage may be taken of the nutritious properties of the Flax-seed, to substitute the inferior for the more valuable grain for horses, and this, too, without any loss of condition being occasioned. The sleek coat of such as are fed in this manner is quite conclusive as to the adaptation of the food to the animals. To feed farm horses economically their Hay should be cut into chaff, and mixed up with farinaceous matters, and the addition of the Flax-seed jelly enables this system to be carried into operation with facility. The quantity of Hay which a horse will destroy and consume when given to him in its natural state, is, in fact, more than double that actually required when cut into chaff.

But enough has, I trust, been said relative to the advantages of this system of feeding, to convince the most sceptical of its value. It, indeed, only requires a fair trial to insure its adoption. The following are a few of the returns which have been obtained by it at Horkesley Hall, selected almost at random from the farm accounts kept by the steward, which were kindly placed at my service. The quantities supplied to each of the animals have not been correctly ascertained, but a usual proportion has been about three parts inferior grain, and one part of Flax-seed meal, somewhat less than a stone of this mixture being daily consumed, with cut Hay and straw, by an ordinary sized bullock. As the details of Mr. Warren's system were not intended to be placed before the public, no comparative experiments as to the value of this compound and other articles of food have been made; but from the experience he has already had, he is quite convinced of the superiority of the compound to any other article of food, both as regards cheapness and the possession of nutritious qualities. The value of the compound is about 5*d.* per stone of 14 lbs.

A lot of heifers, 3 years old, which cost 10*l.* each, after having had a rather small allowance of Mangold Wurzel for a month, were placed on the compound on 21st November last, and sold on the 23rd January following at 9*s.* 2*d.* per score, dead weight, and realised at this rate, 17*l.* 16*s.* 1½*d.* each. This result would have been more satisfactory had the improvements effected by the first month's feeding on the Mangold Wurzel been ascertained.

A lot of two-year old bullocks were laid in on the 21st November, at 7*l.* each, and fed on compound with cut Hay and a small quantity of Mangold Wurzel daily, during a part of the time. These were sold in the beginning of May following at 14*l.* 10*s.* each.

Four two-year old steers, purchased on 29th December, at 6*l.* each, and fed in the same manner as the bullocks, realised 13*l.* each for six months' feeding.

A lot of sheep were laid in the end of September last, at 16*s.* 6*d.* each, and sold on the 13th July at 34*s.* 6*d.* During the last ten weeks these sheep were fed in boxes in the farm-yard on the compound, until which they had been folded on Turnips during the winter in the Turnip-field, and on Clover during the month of October.

Another lot of sheep were purchased on 17th June, at 22*s.* each, and sold on the 26th of August (last week), in Smithfield, at 29*s.* a head. These were folded on Clover by means of hurdles, and supplied with compound morning and evening in troughs in the field.

Further cases of the results of feeding on Flax-seed compound might be adduced, but it is hoped the foregoing will be sufficient to induce many farmers to give it a trial, and report also the results which they obtain. No additional apparatus will be required for the purpose, as it is conceived a Hay and Straw cutter, and machinery for bruising grain are already on every well-managed farm. A common boiler will, in the first instance, suffice for the preparation of the jelly, so that no extra expenditure need be incurred for fixtures until the result of any necessary experiments are ascertained.—*J. Sproule.*

MANURE FOR HOP GARDENS.

About this time last year I read an account, I think in the *Gardeners' Chronicle*, of a Vine-grower in Germany, who had manured his vineyard for some years with the cutting of his Vines. It then occurred to me that our Hop bines, now completely wasted—for they are generally burnt in the field to get rid of them—might be turned to the same use. Not being a Hop-grower, I got one of my tenants to cut up some of the bines into pieces of about one inch long. This was done with a common chaff-cutter at an expense of about 3*s.* an acre, *i. e.* cutting up the bines of one acre; part of these were spread dry into the ground immediately; the rest were put in heaps, of about four bushels in a heap, and covered with earth and left in that state to rot till the time for digging the garden, when it was found that the bine had decomposed into a rich black mould; this was spread about the land and dug in; part of this and part of those that were dug in in the autumn, were dunged with half the quantity of dung given to the other part of the garden—the other half had no dung. The bines throughout have grown as rapidly, looked as well, and at this moment the Hops appear quite as good on the part only manured with the bines, as where dung only was used; nor do I perceive any difference where the dung was added to the cut bines. My tenant is so satisfied with the experiment that he is now making a cutting-box to cut all the bines of his garden, as he is convinced that he will be able to save at least one half the expense of the dung, which he cannot put on under 5*l.* per acre. Now it appears to me but reasonable that this should answer, as it is returning to the soil in a state easily taken up by the growing plant, the very elements that had been taken from it the year before; and all that seems requisite to add is manure to make up for the weight of the Hop, which is carried away. As the cultivation of the Hop plant is very local, it is possible that this experiment may not have attraction for your general readers; still I am anxious to draw attention to it at this moment, when Hop-picking is about to commence, and earnestly hope that other Hop-growers will test the experiment apparently so successfully made by my tenant. —*John Maxwell Tylden, Milsted, Kent.*

SKETCHES OF EAST LOTHIAN HUSBANDRY.

(*Continued from page 612.*)

When the grain first cut becomes thoroughly dried and ready for removal to the stackyard, such of the farm-servants as are usually employed in driving horses are withdrawn from the reaping, for the purpose of leading in or conveying the Corn from the fields to the stackyard. The reaping, leading in, and stacking, are thus for some time carried on simultaneously. The corn-carts previously noticed, of which every farmer has a few, are now put in requisition; but when a sufficient number of these are not obtainable, frame-works fastened to close carts are made to answer the same purpose. A man attends in the field to fork the sheaves to each set of carts, leading to one stacker, and a boy or woman is employed in raking up any stalks remaining on the ground after the stooks are removed. Another boy is also occasionally required on the stacks to hand the sheaves to the builder.

The stacks, which are always circular in form, vary in size according to the kind and condition of the crop and the taste of the farmers. Some take a pride in erecting and possessing gigantic Corn-stacks, notwithstanding the manifest loss of valuable time which their building necessarily occasions. When the Corn has been well won, and got in in a dry state, the stacks are made of large dimensions, but if imperfectly dried, smaller sized ones are adopted. The usual breadth at bottom for Wheat-stacks is 16 feet, and for Oats and Barley 14 feet. It is held as a general rule by East Lothian farmers that all Corn-stacks should be made only of such a size that one of them may afford employment to the threshing-machine and the persons attending it for a yoking of five horses, two such stacks being threshed and dressed in a day. Stacks of this size will contain from 25 to 30 qrs. each, according to the quality of the Corn.

Corn-stacks are now generally built upon raised stands supported by low cast-metal pillars, having projecting caps at their upper extremity, on which the frame-work of the stand rests. The caps also prevent the entrance of vermin into the stack. These stands are usually of a septagonal form, and when firmly constructed, with the timber frame-work of substantial materials, will last for a very long period. They not only admit of stacking the Corn much sooner than what can be done with ground stands, but also effectually prevent the depredations of vermin. Cast-metal stands of this description may be put up in the most substantial manner for about 2*l.* 10*s.* each—a sum which they will soon amply repay. Elevated stands of a more temporary and less expensive character are employed by some farmers; instead of the cast-metal pillars, ones formed of wood or stone are used, upon which the most suitable sticks which can be conveniently procured are placed, without any further preparation; but these require to be renewed or repaired every year. These stands are here commonly formed without the usual accompaniment of a conical funnel projecting perpendicularly from the centre of the frame-work.

Although raised Corn-stands of either of the above descriptions are now pretty general throughout the county, stacks are still not unfrequently formed on the ground, in which case the site on which to build the stack is usually prepared in the following manner:—The centre of the site for the intended stack being ascertained, a stout pin of wood is there driven into the ground; three sticks previously prepared, of an equal and suitable length, and connected at the top by means of a pin passing through perforations in them, are then planted in an upright position over the centre, and the lower extremities of the sticks are stretched out in a circular manner around, and about 3ft. from the centre. A straw rope is next wound round the sticks near the ground, for the purpose of preventing the sheaves from falling into the open space. A tress* from 3ft. to 4ft. in length, made for the purpose, and fixed on the site between the funnel and the margin, allows the free access of air into the interior of the stack. A layer of dry straw placed on the ground, and made circular by means of a string attached to the pin previously inserted to mark the centre, completes the preparation of the site. When the Corn is considered to be sufficiently dry, the funnel or kiln, as it is also termed, is omitted as being unnecessary.

The manner of forming the stacks themselves need not be here described. The head, or conical part, is made rather smaller now than formerly, in order to economise time and straw in thatching. As the kiln or open space in the centre of the stack seldom reaches to the eaves, it is customary to continue the aperture to near the summit by means of a sack filled with straw, which is pulled up as the building proceeds. A flat board is then usually laid across the stack, on which a few draining-tiles are placed. There is thus formed the means of an uninterrupted circulation of air throughout the interior of the stack, from its base to its summit, the influence of which upon the quality of the straw and grain is obviously beneficial. After being built the stacks are thatched without delay, if the weather appear unsettled, but in most cases they are allowed to subside for a few days. Three persons are engaged together at the operation of thatching—two on the stack, one above another, and one on the ground, to fork up the bunches of drawn straw used as thatch. When thatched, the stacks are immediately roped, to keep on the straw. One of the thatchers remains on the stack for this purpose, standing on a long ladder, while the other descends to assist the man already on the ground in fastening the extremities of the ropes either to the stack itself, or,

* Similar to those used by builders for supporting platforms, &c.

what is most general, to a stout rope passing round it immediately below the eaves.

In consequence of the variable climate to which this country is subject, much damage is often sustained by the Corn, from sudden or unexpected falls of rain. To be, in some measure, prepared for such contingencies, it is customary on some large farms to have a band of men solely for carrying on the process of thatching and roping. The usual practice is only to half rope the stacks at first, and afterwards to return and finish them off in as neat a manner as time will allow.

Harvest-time is peculiarly a period of anxiety and exertion. No useful hands are then allowed to remain inactive, and no time is permitted to be lost or trifled away. Economy of time and labour is shown in various ways. The straw ropes employed in securing the thatch upon the stacks are manufactured on the wet days occurring during the summer and harvest. Straw is also drawn into bundles for thatching when other operations cannot be carried on. In the wet and dewy mornings, when the leading in is suspended, the men engaged at it are busily employed in setting up fallen stooks in the field, in thatching and roping stacks already erected, and in preparing sites and kilns for others. By a studious attention to these minutiæ of management, the men are seldom employed at any operation on a dry day that may be done in a wet one; the main work is never delayed when suitable weather for its performance occurs, and much valuable time of men and horses is consequently gained.

Many of the stack-yards deserve a passing notice, not only on account of the plentiful appearance they present after the in-gathering of the harvest, but also from the manner in which the ground is arranged. If naturally wet it is in most instances perfectly drained, and afterwards disposed into wide ridges raised in the crown, and every third one reserved for a road, which is covered with broken stones, coal-cinders, &c. A low stone dyke frequently incloses the whole. An elevated well-exposed stack-yard is, for obvious reasons, always preferred. Wheat and Beans, particularly the latter crop, which, from the succulency of its straw, and the late period at which it is cut, is peculiarly difficult to be got sufficiently dry in unfavourable seasons, are often stacked by themselves in some exposed situation near the field in which they grew—a practice by which the best samples of grain are obtained.—*T. Sullivan.*

ON MINERAL AND INORGANIC MANURES.

No. XXV.

By Professor Charles Sprengel.

(*Continued from page 579.*)

b. Ashes of Soap-boilers.—Formerly all ashes of soap-boilers consisted of extracted wood-ashes and lime, the latter either caustic or combined with carbonic acid. They were, therefore, a superior manure, as they improved vegetation by the phosphate of lime, magnesia, and gypsum, as well as the lime admixed. Since, however, many soap-boilers used soda instead of wood-ashes or common salt, ashes are turned out which consist merely of caustic lime or its carbonate, which have, therefore, not so much value as mere burnt lime. Whoever, therefore, purchases ashes from soap-boilers has to attend to that.

If the ashes of soap-boilers consist of extracted wood-ashes and lime, they are amongst the best mineral manures, still a good marl is always preferable, as any one can see by comparing the chemical constituents of both.

How they act on the ingredients of the soil, does not require to be again referred to in detail. It is also superfluous to speak on the manner in which they nourish plants, as everything just said of extracted ashes applies equally to these. It is the general opinion, that the ashes of soap-boilers act especially by the potash contained in them; but this is a mistake, because, although I have several times subjected them to chemical analysis, I have always found but small quantities of that substance. 100,000 parts of a sort of soap-boiler's ashes, which experience had proved to be a superior manure, consisted of

35,000	parts of	silica.
35,010	,,	lime, mostly in a caustic state.
2,330	,,	manganese.
1,500	,,	alumina.
1,700	,,	oxide of iron.
1,840	,,	oxide of manganese.
0,500	,,	potash, combined with silica into a silicate.
0,180	,,	soda, ditto.
0,190	,,	sulphuric acid, combined with lime into gypsum.
3,500	,,	phosphoric acid combined with lime.
0,090	,,	common salt.
18,160	,,	carbonic acid, combined with lime and magnesia.
100,000	parts.	

Of soap-boiler's ashes, 2000 to 3000 lbs. (in a dry state) are generally used on one acre of land. By 3000 lbs. the soil would obtain about 920 lbs. lime, 70 lbs. magnesia, 15 lbs. potash, 5 lbs. soda, 12 lbs. gypsum, 230 lbs. phosphate of lime, and 3 lbs. common salt, by which it is to be seen, that they owe their manuring properties mostly to caustic and the carbonate of lime, to magnesia and phosphate of lime; as their 15 lbs. potash, 12 lbs. gypsum, &c., may produce a very inconsiderable effect, the more so, as the potash is also combined with the silica into a substance not soluble in water.

After manuring with soap-boiler's ashes, plants of the Clover tribe will grow best, but all other crops will be benefited; and the fresher they are, the more effective, as they then contain much of caustic lime, by which, especially, the carbonic humus, or the organic matter in the soil are affected, and changed into humic acid. Soils which contain very little lime, will be always best improved by them, and in this case they will be very useful, whether employed on fields or meadows. According to the amount used, this effect will last six to nine years; which, however, will be only the case when the soil is not deficient in humus, and such other substances of which the ashes contain but a small quantity.

Soap-boiler's ashes are strewn (like wood-ashes) either over the crops already growing, for instance Clovers, Lucerne, Grasses, &c., or they are harrowed in with the seed of the winter or summer crops, and they act partly like extracted ashes, and partly like caustic lime; they can be also used to great advantage on new marshes.

GEO-AGRICULTURAL NOTES ON SOUTH GLOUCESTERSHIRE.

(*Continued from page 578*).

Lower Lias.—With the exception of the Bath stone—the uppermost member of that portion of the oolitic series which we have described—the strata constituting the lower, or as it is generally termed, the Blue Lias, cover a greater portion of our district than any other occurring within its limits. From the edge of the hills, under which it dips, being overlaid by the rocks we have already described, it extends to the Severn, at Purton Passage and beyond the northern limits of the district. From Purton Passage, where it overlies one of the members of the Silurian series, its western boundary runs south-east, near Berkeley. The marl of the new red sandstone here appears below it, and the junction of the two is easily traceable by Lower Wick Green, along the edge of a slightly rising ground by Charfield, up the eastern side of the valley which extends beyond Wickwar. Here its boundary is irregular; the rock being intersected by valleys exposing the marl and magnesian limestone of the new red sandstone. From Wickwar, the western limit of the lias runs south by Sodbury, overlying the old red sandstone and the mountain limestone, along the edge of the basin already described, of which, with the marl of the new red sandstone there exposed, it forms the eastern boundary. It passes Waterleigh, Siston, and Doynton, leaving exposed there a small district very curious in a geological point of view, which shall be described in its proper place. From Doynton it runs south-west by Barrow Hill, &c., to Hanham, where the line of its junction with the new red marl crosses the Avon to Keynsham, and thence it lies along the irregular edge of the hills to Bristol. Besides this tract, which extends the whole length of our district, and varies from upwards of four miles as at Purton and Pucklechurch to less than one mile in width, as at Wotton-under-edge, there are numerous cases in which it occurs in smaller extent capping the hills and covering the highlands which occur on the other side of the basin. Thus, proceeding from Bristol to Gloucester, the first ten miles of the road lie along a district of this kind. The boundary of this tract, commencing at Montpelier by Bristol, runs along the edge of the hills by Stoke as far as Itchington, where it crosses to Abbey Common by the Gloucester road, overlying the mountain limestone between the two places. From Abbey Common it proceeds by Alveston, Almondsbury, Over, Compton, round by the edge of the vale of Henbury, by Charlton, above Westbury, near Redland, to Montpelier, whence we started; thus inclosing a tract of about 20 square miles in extent. Besides this, which is by far the most extensive of these outlying masses of lias, it occurs at Aust, at Henley Hill, and the hills overlooking the town of Thornbury, on the south; at Eastwood hills, and Whitecliffe Park, near Berkeley, overlying the new red marl. It also covers the red marl at Tortworth-coppice, also between Charfield and Wickwar. Its occurrence so frequently, and at such distances on nearly one level, shows that at one time it must have covered nearly the whole of the vale. The lower lias consists of two members:—an impure limestone-rock, of a blue or white colour, deposited in layers varying from 6 to 10 inches in thickness, with thin seams of clay between them; and a stiff calcareous clay, of a blue or yellow colour. This last is the general character of the lias in the northern part of the vale. There is little or no rock to be found north of Almondsbury, Stoke Gifford, and Westerleigh. To the south, however, of a line drawn through these towns, the lias consists chiefly of the rocky member. The lias varies in thickness; in one instance, at Codrington, it thins away altogether, and leaves a tract of mountain-limestone exposed in the midst of it. The rock of the lias is burnt for lime when lime of a better quality, as at Stoke Gifford, Bristol, &c., cannot be had in sufficient quantity. It is suited for underground and water-works; the price is generally 18*s.* a hundred bushels. The chief portion of the expense in the quarrying consists in the necessity of removing the great quantity of clay between the beds of rock; and hence, a quarry is frequently carried over the whole extent of a field, three or four only of the beds being dug, and the surface being thus lowered 2 or 3 feet as the quarry proceeds. In the northern part of the vale—at Slinsbridge and Frampton, &c.—the clay of the lias is covered by beds of gravel, as has been already said.

Agricultural Character of the Lias.—The surface of this formation is in the northern part of the district, which is chiefly clay, nearly level, the undulations being very slight. South of Westerleigh and Dyrham, however, where it is chiefly rocky, many valleys intersect it, leaving ridge-like hills and abrupt eminences. It is very much covered by wood. This wood is chiefly Oak. Down at Purton Passage the country has a most forest-like appearance, and this is generally the case over the clay of the lias. Thus, at Hawksbury, several square miles of an Oak plantation occur on land otherwise worth very little, as is attested by the wretched state of the commons surrounding it. On the rocky part of the lias the country is not so thickly wooded; a view of the country in the neighbourhood of Pucklechurch from Hinton Hill, near that town, is very bleak. The soil on the lias is of two kinds. It is clayey or brashy, according as it is on the clay or the limestone. North of Almondsbury and Dyrham it is a dark, nearly black calcareous clay, the subsoil being either blue or black. In the neighbourhood of Newport it is a brown or light-coloured clay, the subsoil in this case being of a yellow colour. Towards Doynton and Wick, the soil is a black clay, full of fragments of the blue and white limestone, on which it rests. Over the whole of the formation the land is almost entirely in pasture, which is very much overshadowed and soured by the hedgerow timber. The fields are generally small, and the hedgerows wide. The pasturage is of a very poor kind, as might be expected on a soil which is so thoroughly soaked during six or eight months of the year. It consists, in great part, of Sedges, with a few plants of Plantain, and plenty of Rushes. The way in which these dairy farms are managed varies greatly. It is generally allowed that, to take more than one, or, at the most two, successive crops of Hay off the land is bad management. The value of the spring feed is nothing; the land being rarely in a state fit to allow of being stocked, till it is time to shut it up altogether for the Hay crop. The Hay is harvested in the month of July. It seldom averages more than 15 cwt. per acre. After mowing, the land is stocked till November, or later, if the land be sufficiently dry. If a crop of Hay is to be taken next year, the farmer tries to manure so much of his land each year. This is sometimes laid on not long after the mowing, in August or September, though generally it is done during the frosts of winter. If the land is not to be mowed the next year, this manuring is put off till next autumn, the land being depastured during the interval. In general, however, one year's grazing supplies the place of manuring. After all, the manuring the land receives is not calculated to do it much good. The scrapings of the ditches, mingled with the droppings from the cows that have been collected from the fields, where they have been consuming the Hay during the winter and spring, is all that it gets, and this is not laid on plentifully. In a great many instances, however, the land does not receive such good management as this. Frequently two-thirds of the land is mowed, and the other third depastured each year; that which is furthest from the buildings being mowed, and that next the farm and the buildings, and therefore more convenient for the dairy, being grazed. None of this land is efficiently drained; it is always soaked during winter; indeed, the farmers deny that it is possible to keep it dry. The prejudice, however, which still exists in many places against underground draining, is disappearing gradually. Many farmers would willingly pay 5*l.* per cent. on money laid out by the landlord in this way. But the chief way in which water is carried off is still by open gripe, which are cleaned out once every two or three years, and the earth laid in heaps and mixed with the cow-droppings to be spread over the land. The mole-plough is in considerable use also. It is either worked by a windlass or by horses—in the latter case a great many are employed; I know of one instance in which eighteen horses in a row were used by a farmer to make a drain only 18 inches deep. The loss of power in such a case must be immense. A more effectual way of draining land is also to a considerable extent adopted; this is termed clay-draining. The labourer stands on the surface of the ground, and, with a tool for the purpose, digs a trench about 20 inches deep, 2 wide at bottom, and perhaps 10 at the top; after clearing this out, he uses a wooden mandril, made of pieces of wood of the size of the drain, connected together by hinges, so that it is to a certain extent flexible; this fits the bottom of the trench, and fills it up to a depth of 6 or 7 inches; clay is hammered on this, and the drain is filled in; the mandril is then drawn forwards, clay is hammered down on it again, and the drain is again filled in, and so the work proceeds. This is much more effectual than the mole-plough, but not so permanent as draining with stones or tiles. The general objection to draining deep with tile or stone is the statement that water will not sink through the clay to them: the use of the subsoil-plough is thus called for, and if the pastures were broken up and well cultivated, and properly laid down again after the use of this implement across a thorough drainage with tile, their value would certainly be greatly increased. This effect would also probably follow the use of the mole-plough across the direction of deep stone or tile drains, although the land were not ploughed up, but merely pastured with sheep for four or five years. There is, as has been said, very little arable land on this soil. Many farms are entirely pasture; some, however, have a few acres under the plough. This is generally cultivated without any system, Wheat and Potatoes being the chief crops, and these are taken to supply the house. When it occurs in larger quantity the system on which it is cultivated is not only generally faulty, but the way in which it is carried into effect is slovenly: in many instances nothing but Tenths are grown, of which occasionally good crops are raised on this soil; but these will not pay for the injury which the land must receive from so scourging a crop, repeated so many successive years.

There are many instances in which a farmer, who has obtained permission to break up a field of Grass, has taken crops of Wheat after Wheat off it, until the land would not carry it any more, and then having laid it down for a series of years, till it is refreshed sufficiently, has broken it up again to give it the same treatment. The general rotation on the lias is a three-year course—Wheat, Beans, fallow. The kind of Wheat sown is the Blue Cone or Red-straw Lammas; generally the former, which seems to be well suited for a stiff clay. Eighteen or twenty bushels per acre is an average produce. This is a very low one for a clayey soil, but it is owing to the extreme state of wetness in which the land lies during six months of the year. If the land should get worn out with this treatment, it is laid down for several years; a very small crop of seeds is, however, obtained. Occasionally a portion of the land in fallow is sown to Vetches, which are cut for the stock. In some districts a crop of Oats is taken between the Beans, and the fallow, or Vetches. The crops then come round once in four years; viz., 1st, Wheat; 2d, Beans; 3d, Oats; 4th, Vetches, or fallow. This formation, when compared with the others in an uncultivated state, is certainly one of the lowest in the scale of fertility. This is well seen in Wickwar and Yate Commons. The land is covered with brambles and briers, the scanty pasturage being nothing but Sedges and Rushes. The Sloe and the Thorn, indeed, are not confined to the commons; it is hard to keep them out of the pasture lands. This aptitude to grow Thorns may almost be made a means of laying down the boundaries of the formation. Thus, on going from Alveston to Itchington, the Thorns disappear entirely as soon as we step off the clay of the lias on to the rock of the mountain limestone. The lias joins on to the gravel and the marlstone, by which it is covered, and to the new red sandstone, the mountain limestone, and old red sandstone, which it covers. In none of these cases but that of the gravel, which has been already mentioned, is that increased fertility consequent on a mixture of the two rocks observable. At its junction with the mountain limestone, the soil on the lias is benefited, or otherwise, according as the clay thins off abruptly or gradually from the rock. In the latter case the nearness of the rock to the surface acts as a drain. The improvement, which in some instances, I was told, existed in the nature of the soil just at the junction of these two rocks, is due more, I think, to this drainage than to any mixture of the clay and the limestone. The lias is the first formation we have mentioned, on which, within this district, the use of lime is sanctioned by experience. On most of the arable land on this formation, lime is used to the extent of about 70 or 80 bushels per acre. It is laid generally along the headland of the field on which it is to be spread, and being covered with earth is allowed to slack perfectly, after which it is carted or wheeled over the ground. The expense of liming, and all the chief expenses of cultivation, are made to precede the Wheat-crop, on which principally the farmer depends for his return. I met on this soil, near Frampton, with a curious instance of the extent to which long experience and observation may teach the same lessons as a knowledge of the science of geology would lead to. It was observed by a farmer, over whose farm I had been walking, that a good soil never existed where those shells (pointing to a number of fossil shells in the soil) were found in it. The shell was a graphite characteristic of the lias. The experience of the agriculturist had led him to connect the faults of the soil in some way with the existence in it of these shells. The geologist would at once know the nature of the subsoil from their presence in such abundance; and, throughout this district at any rate, the soil over that subsoil is bad.

Home Correspondence.

Woes of Farming.—I am a little man, with a little land, no experience, very little money, and a very great demand for it. I wanted to make my capital of 1000*l.* work a farm so as to keep myself and family in comfort, my daughters playing their piano, my horse having his groom, and I some good old port in the cellar for myself and friends. This was, I think, a very natural desire; and an old friend of my father's who had been a farmer in 1810, and had made a fortune, told me that I might be sure to do well, if I was but attentive to my business. Well, sir, I took a farm of 100 acres two years ago, and I paid great attention to it for a twelvemonth; but at the end of the year I found my capital all gone, although I took all the care I could of my money. Seeing that affairs had taken such a bad turn, I borrowed another 1000*l.* of my brother-in-law, discharged my bailiff, and took to farming scientifically. I bought guano, nitrate of soda, Potter, Poittevin, and Humphrey; but one turned out clay and brickdust, another salt, while chalk, charcoal, and sawdust was all I could make out of the others. They seemed to be no good, but I was told they were scientific, believed, and tried them. And now I am worse off than ever; I have wasted my own money, I have spent my brother's, and what is worse, I am deeply in debt. What am I to do? It seems to me that the friend who recommended me to take to so beggarly a trade as farming ought to pay my losses. But he will not; in fact, he says I am a lunatic, and fit for nothing but a strait waistcoat. I answer, I have straits enough without that, and I hope you will advise me what I should turn to next.—*Edward Pinthorn, Barkinfield.*

[It seems to us that the friend is right, and that advice is wasted upon one whose ignorance is even greater than his folly.]

Allotments.—A stranger hearing that I let land near the Seahouses, Eastbourne, at 1*s.* a rod, which is 8*l.* an acre, including rates, tithes, and taxes, blamed me, supposing the rent unreasonably high. When Benjamin King, who receives the rent of upwards of 400 allotments for me, was called in, he said not one farthing rent had been deficient in ten years, and that he had more applications for allotments at 8*l.* an acre near the fishermen's houses, than at 4*l.* near the church, though before the little tenants broke up the old turf it was called poor, sour land; and B. King said this land at 160*s.* an acre was more coveted than land at 6*s.* an acre on Beechy Head, also including rates, tithes, and taxes, though this last land had at that rent yielded the tenant at the rate of forty-eight bushels per acre of Wheat—I think the 7th year after breaking up the turf, which as a sheep-walk does not keep one ewe per acre. The land on the Down was not equally coveted, because it was two miles off, and up an ascent of 500 feet, which could not be accomplished at the odd hours which the land near at hand profitably employed. I presented, as dessert, to the stranger who objected to 160*s.* per acre, rent, rates, tithes, and taxes, a Cabbage—one the tenants had just given me—which weighed 22 lbs., produced by means of the manure his fish afforded. If gentlemen would oblige their neighbours by accepting the high rents their neighbours would gladly tender them, all parties would be served. Near Penzance, in Cornwall, about 20 years ago, 1000 acres of land were let for 10,000*l.* a-year; and Mr. Cuthbert Johnson's pamphlet on liquid manure, sold by Ridgway, says, the Grass lands round Edinburgh, watered by the town drainage, are yearly let in small portions by auction, at from 20*l.* to 30*l.* per acre; 130 acres belong to W. Miller, Esq., and the rest to the Earls of Moray and Haddington.—*M. A. G.*

Wide Drilling.—In the *Gazette* of 6th July, "Home Correspondence," this subject is treated of by "Lusor," referring to your article on the subject in p. 413. Having referred to it, I now send you an experiment of my own, made last year on Wheat. In farming my own land for the last eight years, I had always used a Suffolk drill for grain crops at 10 inches apart. Last year I had convinced myself that 12 inches would be better, and from 5 to 6 pecks of seed per acre instead of 3 bushels, usually applied; being of the same opinion on this head with Mr. Hewit Davies, who has written on this point. I was, however, induced to make a practical experiment on a wider drill, through my becoming acquainted with the results of a crop of Wheat—Golden Drop—which a neighbour had harvested the year before, put in at 2 feet apart in loamy brush land; he reaped a most abundant crop. Not having had all the results of his experiment, which I found had been carelessly carried out, until January last year, I had not time to try a similar one at my autumn sowing, so I determined to make a spring experiment of it, on a close of land that had been part of a coppice wood which I had grubbed up four years previously, but had not had Wheat in it before, and was then preparing for Beans, being heavy rich land, shallow, brush sub-soil. I, however, marked out two plots of 10 perches each, adjoining each other, and had the seed hoed in drills, north and south, one at 1 foot, and the other at 2 feet, as follows. It came up well, and progressed admirably. There were no weeds;—it was hoed at the commencement twice.

No. I.—Seed, Red-straw Lammas—the Wheat which suits this neighbourhood best. Hoed in on the 18th Feb., 1843, at the rate of 5 pecks per acre, in drills 1 foot apart, in a direction north and south, on 10 perches of rich heavy land; harvested September following, threshed, cleaned, winnowed, and weighed immediately:—

Produce of grain	2 bushels
Weight	124 lbs.
Straw	270 lbs.

Good sample and very little tailing.

No. II.—Seed, same as No. I. Hoed in same day, but with little more than half the quantity of seed, viz., at the rate of 3 pecks per acre, at 2 feet apart, on 10 perches of same land, and adjoining No. I.; harvested the same day:—

Produce of grain	1 bushel 3½ pecks
Weight	114 lbs.
Straw	234 lbs.

Sample better than No. I.

The Red-straw Lammas is essentially a winter Wheat; the crop, therefore, would have been greater had it been put in in November instead of February; or, if I had used a spring Wheat instead; and it being close to the wood the birds attacked it greatly. I have not thought it worth while to make another experiment as to 2 feet-drilling, because I am convinced that such a distance could never answer as a universal method, it being too far apart to support itself in exposed situations. The above results of No. II. would have been greater had it not been partly laid: the sheltered situation saved it from being more so. This experiment has, however, been a useful one. It clearly demonstrates that Wheat requires space to expand its roots in; therefore, broadcast or narrow drilling cannot be a correct method. My crops of Wheat this year, just harvested, being very fine and abundant, all drilled in at 1 foot, with 5 pecks of seed only, there will be very little tailing. As the above experiment may be worthy of your notice when making a comparison with the others, I understand from the *Gazette* to be in progress, I have thought it well to send it you.—*Henry T. Davis, Waterhouse, near Bath.*

Wide Drilling and Dibbling.—Having recently observed in your Paper, and in others, several paragraphs on the advantages of dibbling seed-corn, and of sowing a much smaller quantity of seed than is usually done, it occurs to me that the result of a small experiment I made on a patch of ground adjoining my garden might not be uninteresting, and, by confirming previous statements, might lead others to make experiments on a somewhat larger scale. The following Tables will furnish you with the particulars of my experiment:—1st. As to produce of a single grain of three kinds of Wheat. 2dly. The total produce of 50 grains of the same description; and 3dly. The quantities per acre.

TABLE No. I.

Time of Sowing.	Sort of Wheat.	Quantity Sown.	No. of Ears Produced.	No. of Grains.
Nov. 18, 1843 ..	Red Lammas.	One Grain	39	1267
Ditto	Creeping Red.	Ditto	34	928
Ditto	Prolific.	Ditto	31	1040

TABLE No. II.

Time of Sowing.	Description of Wheat.	Quantity Sown.	No. of Grains destroyed.	No. that produced Corn.	No. of Ears produced.	Average No. of Ears to each Corn.	Total No. of Grains.	Measure of Grain.	When Cut.	Quantity of Ground.	Mode of Planting.
1843, Nov. 18	Red Lammas.	50 Grains.	16	34	642	19	19,128 or 562 to each grain.	3½ Half Pints.	Aug. 1st, 1844.	18 square feet.	Dibbled 6 in. apart
Ditto.	Smith's Creeping Red.	50	15	35	765	21	19,925 or 569 to each grain.	3¾ Half-pints.	Ditto.	Ditto.	Ditto.
Ditto.	Smith's Prolific Red.	50	12	38	637	16	19,711 or 518 to each grain.	3½ Half-Pints.	Ditto.	Ditto.	Ditto.

TABLE No. III.—PRODUCE PER ACRE.

Description of Wheat.	Quantity of Seed.	Quantity Produced.	Weight per Bush.	Quantity of Straw.
Red Lammas.	121,000 grains or six 4-5th quarts.	66 Bshls.	60 lbs.	65 cwt.
Smith's Creeping Red.	Ditto.	70⅞ Bshls.	62 lbs.	49 cwt.
Smith's Prolific Red.	Ditto.	66 Bshls.	60¼ lbs.	63 cwt.

In order to form a correct judgment of the above Tables, it is necessary that I should add some particulars. There is no doubt the produce would have been very much greater, had the season and other circumstances been more favourable. The loss sustained in various ways is far more than any deduction that may properly be made from the above figures, as being the result of a garden experiment. In the first place, the soil, though recently broken up, was unfavourable for the season—a stiff, dark, heavy loam (lying in a clay subsoil), full of vegetable matter and very wet; the consequence was that about one-third of the whole plant was destroyed by the slug, and the rest was much weakened; again, the long-continued dry weather, although generally favourable for the Wheat crop, in this instance was otherwise, as nearly all the outside plants were injured by the roots being so much exposed, through the very large fissures in the soil. Although the average number of ears to each grain is about 19, in many cases only 6 or 8 ripened; the remainder died away, having become loosened from the ground. Very considerable additional loss was sustained by the birds; for although I had a girl five weeks tending it, yet of so little effect was it, that in order to secure it at all, I was obliged to cut it quite green, which very much lessened the bulk—of course, not only the measure, but also the weight. I have, however, given you the exact result. The samples and quantities answering to the above Tables I have by me, and may add that I have seen to the matter entirely myself. I intend this autumn planting an acre on the same principle. I hope others (practical men), will be induced to do so, as it is by experiment alone that the comparative merits of thin and thick sowing can be ascertained.—*E. W. M.*

Potato Failures.—I quite agree with Mr. Alexander's remarks in page 596, and think the following is a further proof of the correctness of the observations as to the land being moist, so as to bring out the latent powers of vegetation. A farmer near this for some years, and with great success, has adopted the following plan:—If the season be very dry he has the manure well watered before any of it is put into the drills; this causes a great moisture to the earth in the drills; no time is lost in getting the Potatoes in and closing them up. This year he has a most abundant crop, and his neighbours a complete failure whose manure was dry when put into the drills. Where guano and manure have been used together for Potatoes, they have answered well this season, and for this reason guano, when deposited in the earth, produces a moisture similar to salt when it dissolves in the earth, or by dampness.—*M. S.*

What is the action of common Salt on Carbonate of Lime?—I should be extremely obliged if any of your chemical readers would inform me whether salt and carbonate of lime (under the form of sea-shells) would, if

slightly moistened and left in great masses long together, act in any degree on each other? It is, I believe, known that masses of the same substances will act on each other, of which smaller quantities will not. I do not ask this question for agricultural purposes (though possibly the answer might be of some interest in that point of view), but from having found in Peru a great bed of upraised recent shells, mixed with salt, which are decayed and corroded in a singular manner, so that the surfaces of the shells are scaling off and falling into powder. I may mention, as explaining one element in the value of sea-shells as manure, that they are dissolved by water with greater facility than apparently any other form of carbonate of lime: one proof of this I observed in a curious rock, from Chili, chiefly composed of small fragments of recent shells, which are all enveloped and cemented together by a pellucid calcareous deposit; but in some parts of this rock the little included fragments are in every stage of decay and disappearance; in other parts they are entirely dissolved, the little calcareous envelopes being left quite empty. Here we see that water, capable of dissolving shelly matter, has penetrated through their thin films or envelopes of carbonate of lime, without having acted on them; these films, moreover, being a deposition from water within quite recent times.—*C. Darwin.*

Potter's Guano.—I received this analysis from Mr. Mason. The sulphate of soda cost me 3*l.* 10*s.* a ton, and was very good, with a slight excess of sulphuric acid, not injurious, I think, to vegetation. I obtained the sulphate of ammonia at 17*l.* a ton, but I diminished the proportion of gypsum and salt, in order to employ a larger quantity of sulphate of ammonia. A compound resembling the manure which you have sent me for analysis, may be made as follows:—

Bones ground fine	200 parts
Sulphate of lime	100 ,,
Common salt	100 ,,
Sulphate of soda	75 ,,
Sulphate of ammonia, mixed with urine.	25 ,,
	500 parts.

—*X.*

Guano; Superphosphate of Lime.—Last year I had some Guano sown over part of a field of Wheat, which had been manured with between thirty and forty bushels of lime per acre, in the autumn, at the time of sowing the seed. There was not more grain at the time of harvest, where the guano was sown, than where there was none, but much more straw. The expense of the guano appears to be almost thrown away. With regard to superphosphate of lime, I used about four bushels an acre, drilled with the seed; but from the strong and rank appearance of the leaves, I should think a less quantity sufficient.—*J. W.*

Transmutation of Species.—In Dodsley's "Annual Register" for 1759 (p. 381), is an account of some Oats which the second year produced in Sweden Rye, having been cut off two and three times. I sowed some in March, 1832, and cut them several times, but the roots died in the winter. The experiment was a source of great ridicule and amusement to my neighbours. Did not Bruce find Wheat apparently growing wild about the source of the Nile?—*C. M.*

New Soil.—Surely your correspondent, "Rambler," (p. 580), is incorrect in stating that Potatoes are generally better in a new than old soil. Every person I have conversed with on the subject, allows that the produce is larger [that is probably what he meant,] but that the quality is much inferior, being waxy. This year I had a piece of pasture double dug (the Grass sods being removed), and set with Potatoes and various manures; the quality from all the manures is bad.—*R. J.*

Clover Dodder.—I have inclosed a piece of what I believe is the Dodder plant, Cuscuta europæa, the stem being thread-like, yellowish, branched, and twining. The seed of this horrid parasitic plant I have no doubt has been introduced into our Clover in the foreign seed which is generally sold to the farmers. The havoc the Dodder has made amongst the Clover is quite astonishing; immense patches of yellow silk-like net-work may be seen all over one of the fields near this place, and in a field of my own, although I had taken the precaution to have a space cut all round the Dodder, and the plant itself cut and thrown together, yet so tenacious does it seem of vitality, that it has spread afresh and commenced blooming. I have this time had it cut and burnt, as I feared much that, should it be allowed to seed, I should have had a troublesome enemy in the land, awaiting to destroy any plant that might be brought or grown in its neighbourhood.—*Rurirusticus.*

Failure of Hay Crop.—I do not see that your attention has been called to the serious consequences of the almost total failure of Hay in the grazing and dairy districts, where for the most part not more than 20 or 30 acres out of 100 are under the plough. In the neighbourhood of Aylesbury, the average crops of Hay have not exceeded 5 cwt. per acre, instead of from one to two tons; and many meadows have not been cut at all, from the shortness of keep in the pastures. Many have been relying on rain in July and August, to mow in September and October, but this is now out of the question. The object of this communication is to invite discussion and information as to the best mode of supplying dairy stock with food, in lieu of Hay, during the winter, in a district where green crops, and especially Turnips, are scarcely known. On my farm of 360 acres, about seven acres sown with White Carrots and Mangold Wurzel, have wholly failed; and my Turnips, although they came up abundantly, and are untouched by the fly, are dying away in the present drought.—*A Farmer.*

FARMERS' CLUBS.

Darlington Farmers' Club.—This Club held their monthly meeting on Monday last, at the offices of Mr. Thos. Dixon, Land Agent, their Honorary Secretary, when there was a pretty good attendance of members present. The subject under discussion was The most beneficial Time for Reaping Wheat and other Corn, and the profitable Mode of Cutting and Securing it. Henry Chapman, Esq., the Chairman, introduced the subject, and said, that having formerly himself been a pretty extensive farmer, for a good many years, more particularly in Derbyshire, he had had opportunities of observing the cutting and harvesting of Wheat under different circumstances, and he was decidedly in favour of cutting Wheat before being fully ripe, as by that means a finer sample is obtained, as well as having the crop cut with less waste; but although he was an advocate for reaping Wheat before being fully ripe, yet he did not recommend cutting it very raw; for although a brighter sample was by that means obtained, yet he was strongly of opinion that it yielded a less quantity of flour; not, however, having himself made any experiments in proof of this position, he merely gave it as his opinion.—The Secretary then said, that from the experience he had had, he considered it judicious to cut Wheat a little earlier than what has been generally practised, as by that means not only is a brighter and better sample obtained, but if the crop is broken down, as is sometimes the case, it could be cut up much cleaner in a raw state than if fully ripe; the straw is also of a better quality, and in a wet harvest both the corn and straw stand the weather much better than when cut ripe. And in support of this position he mentioned the circumstance of the Wheat on the farm on which he was resident in the wet and unsound harvest of 1816 being cut in a very raw state, and the consequence was, that when all the neighbouring farmers' Wheat was completely sprouted in the stook, by the long-continued wet weather, the Wheat on this farm was comparatively sound; and in the succeeding winter and spring, when other farmers of the neighbourhood sold their Wheat in Darlington Market at 22*s.* per sack, the Wheat from this farm sold for 28*s.*; and he believed that the principal, if not the only reason, was that the Wheat on this farm having been cut in a much earlier stage of ripeness than the rest of the neighbourhood, it was not so easily affected by the weather. He then read some extracts from the "Quarterly Journal of Agriculture," detailing some experiments made by Mr. J. Hannam, of North Deighton, near Wetherby, by which it was clearly shown that it was injurious to allow Wheat to stand until fully ripe before cutting, and that the best period for cutting Wheat was from 10 to 14 days before fully ripe.—An animated discussion now ensued both as to the proper period for reaping and the best mode of cutting and securing the crop, and several members considered hooding the stooks of great service in securing the Grain from the ill effects of the weather; whilst, on the other hand, several others were of opinion that, if properly stooked, it was as well without hooding. As to the best mode of reaping, it having been up to this time almost the universal practice in this neighbourhood to cut Wheat with the sickle, there was no advocate for deviating from the old practice; but as regarded the proper period for reaping, the members present were unanimous in opinion that it is best to cut Wheat in a rather raw state—perhaps a week, at least, before being fully ripe.

Miscelianeous.

Cultivation of the Turnip.—The land is ploughed up as early as possible in the autumn, and receives one, two, or more ploughings, as opportunity offers. In the early part of the winter such portions as require draining are thoroughly drained with pipes of two inches' bore, having the opening heart-shaped—the widest part of which is placed downwards—upon the top of which stone is placed to about three inches in depth, consisting principally of small flints and pebbles, picked from the surface of the land; as soon as the land is sufficiently dry it receives two deep cross-ploughings early in the spring, is rolled and harrowed until a fine tilth is produced, and is then formed into ridges, or small stetches, 37 inches each in width, which is thus effected:—A straight furrow is first ploughed, and a double-breasted plough is then used, having a marking instrument attached, which consists of a small straight tough pole fixed at right angles from the beam of the plough by means of a hook, and placed as far back as possible, so that it does not derange the operation of the plough whilst working; at the end of this stick an iron is fixed exactly the width of two of the intended ridges, which is connected diagonally by a chain with the whipple-tree of the horse; this, as the plough proceeds, marks out the next furrow, occupying the space of two ridges. The work thus proceeds followed by a similar plough, or by the ploughman returning, who, by passing his plough down the middle of this space, divides the stetch of 6 feet 2 inches into two smaller ones of 37 inches each, the marker still defining the distance at which the plough should be held; the ridges being formed, are ploughed off with four furrows to each, and then every fifth ridge is drawn out to enable the manure to be carted on without injuring the form of the ridge. After the manure is carted on, at the rate of 16 loads of 40 bushels each, the ridges are then ploughed by four furrows, leaving a small baulk in the centre so as to divide the ridge into two spaces for the manure, which, from being partially decomposed, is easily spread in this double furrow; the land is then ploughed at four furrows to each ridge, and the manure being covered in, is rolled and harrowed, and is again rolled with a light roller. The Turnips are then drilled—two rows upon each ridge 11 inches apart, at the rate of 4 pints to the acre, thus standing at alternate spaces of 11 inches and 26 inches between the rows. As soon as the Turnips appear, they are singled out by boys and women at 15 inches apart, and are left standing diagonally with each other; they are then carefully and deeply hoed with a heavy hoe, and the furrows are kept clean with the horse-hoe, but the Turnips are invariably set out by hand and never by the hoe, the deep hoeing that is given being considered a main point in the system over and above that pursued with the common light Turnip-hoe; and the singling by hand is assisted by a small measured stick 15 inches in length, enabling the children employed to set the Turnips out regularly and diagonally, so that when finished they stand thus ⁘. In the months of November and December the Turnips are all pulled, avoiding the use of hooks or cutting instruments for trimming them, merely wringing off the tops and dislodging the greater portion of the earth attached to the fibres without cutting them. The Turnips are then carted to the respective fields where they will be required for winter use, and one moiety of them is left in the field for using there; those left are put into heaps of about 40 bushels each, are thatched over with straw, and the earth shovelled up and placed round the heaps to the top, which ends in a point. Those taken from the field are carted to the headlands of other fields where they will be required, which are principally those upon which Wheat was grown in the preceding year after Clover. The old hurdles used for folding are then selected for this purpose; one is placed first at the end across the space to be occupied by the Turnips, and two more are put at right angles, forming a space made by the double row of hurdles, in which the Turnips are placed, taking care to cart them when dry, and adding more hurdles lengthwise until sufficient space is obtained, and the Turnips are disposed of in rows about 7 ft. wide and 4 ft. in height. The Turnips are then protected by the earth being dug up and placed on both sides, leaving air-holes at about 4 or 5 feet distance, level with the surface of the land, which may be formed as the work proceeds by introducing small faggots tied loosely, or by any other mode, leaving the sides of the whole open so as freely to admit air, and extending across from side to side, which is of especial importance towards the preservation of the Turnips, as they might otherwise get into active fermentation, which when it takes place frequently destroys the greater part of them. The top of the heap is then covered with Barley-straw and thatched, and thus the Turnips are preserved from injury by frost and game during the most severe weather, and will remain in excellent condition until May following, very little impaired by keeping. The application of them is by feeding them upon the eddishes, and upon the land upon which they are grown by sheep in fold. The Turnips are all sliced, and the sheep are regularly fed in troughs, having a new fold every day, and with from ½ lb. to 1 lb. each of oil-cake per day. The sheep, for the most part, consist of lambs of the last year, and cost from 16*s.* to 20*s.* each—these in the following spring are shorn and sent to market, and produce from 30*s.* to 32*s.* each; the fleeces from the half-bred Leicesters weighing each about 6½ lbs., and selling from 12*d.* to 16*d.* per lb.—*Mr. Baker, on Essex Farming, in the English Agricultural Society's Journal.*

African Guano.—The guano, in the state in which it was received, formed a moist chocolate-brown powder, intermixed with numerous particles of a whitish substance. It possessed no urinous odour, but smelt strongly of ammonia. On examination under the microscope, no crystals of any kind could be detected in it; but it contained numerous remains of plants, partly in a state of decomposition, but still exhibiting a green colour, and globules of starch in the cells, likewise brown and white feathers, fragments of egg-shells and fish-bones. The aqueous solution was of a light reddish-brown colour, was strongly ammonical, and deposited on slow evaporation an abundant crop of crystals of the triple phosphate of ammonia magnesia. On adding nitric acid to the filtered liquid, an abundant flocculent brown precipitate subsided, which consisted of humic acid and extractive. The insoluble portion was of a light sandy-yellow colour. On boiling with solution of potash and precipitation of the filtered solution with hydrochloric acid, a light-brown flocculent substance subsided, which amounted to 5·50 per cent. This was first regarded as uric acid, but on further examination it proved to contain but slight traces of that ingredient, and to consist of a substance allied to humic acid. To determine the absolute amount of ammonia, one of the ingredients on which the value of guano chiefly depends, a weighed portion of the guano in its normal state was analysed according to the method described by Varrentrap and Will, and afforded 9·70 per cent. The other ingredients were determined in the usual way, and according to the results of analysis, 100 parts of the guano in question consist of—

Volatile salts, as oxalate of ammonia, chloride of ammonium, carbonate of ammonia, and combustible organic matter, containing 5·50 per cent. humic acid, uric acid and extractive . . .	33·97
Water	27·13
Ammonia	9·70
Phosphates of lime and magnesia	22·32
Insoluble residde in nitric acid, consisting of sand .	0·81
Alkaline salts, chiefly phosphates, muriates, and small quantity of small sulphates (chiefly potash).	7·08
	100·00

From the above examination, it is evident that the African guano differs considerably from the Peruvian and Chilian, *i. e.* that it has been more exposed to the decomposing influences of atmosphere and water than either of those kinds, and tends rather to confirm the

views of Fritzsche, Payen and Boussingault, Girardin and Bidard, that the Peruvian guano is in a state of fossilisation. The most remarkable guano hitherto analysed is that described by Fritzsche,* whose investigations, as far as we are aware, have hitherto remained unnoticed in this country. We need, therefore, not apologise for giving a brief abstract of them in this place, more particularly as they will prove how requisite it is that the agriculturist, before purchasing guano, should have a sample submitted to analysis by some competent chemist. Fritzsche describes the guano submitted by him to examination as a dry coarse powder, in which some large compact masses occurred of a yellowish-brown colour. The compact pieces from which the powder had originated were distinctly composed of superposed strata, seldom horizontal, but most frequently compressed and undulate. The strata are of two kinds, one of a brownish-yellow colour, and consisting principally of urate of ammonia; the other of a blackish-gray or dark brown colour, and formed principally of clay. Both layers alternate with each other irregularly, their relative proportions varying considerably. The argillaceous strata are of a more compact nature than those of the urate of ammonia. All the layers of clay are coated with a whitish rind, which cannot be readily washed off with water. This coating consists of urate of ammonia, and proves beyond a doubt that the guano in question has acquired its present state through the agency of water. Feathers, vertebræ, and fragments of other fish-bones occur frequently, as well as remains of plants and some seed. The guano had a strong urinous smell and a faintly saline taste. 16 oz. of the pulverulent mass in its moist state afforded on solution in caustic potash and precipitation with muriatic acid, 7 oz. 2 drs. of a yellowish-brown coloured crystalline hydrate of uric acid = 37 per cent. anhydrous uric acid. 200 grs. of a compact fragment, with very few seams of clay, gave, on being similarly treated, 118 grs. or 59 per cent. of anhydrous uric acid. The residue of these experiments consisted for the greater part of clay, which readily subsided, probably on account of the earthy phosphates contained in it. From the occurrence of so few organic remains, and from the interposition of the argillaceous masses between the layers of urate of ammonia, it is evident that the guano in question cannot have been deposited by the birds in the state in which it occurs at present; the coating of urate of ammonia, which adheres so firmly to the seams of clay, decidedly shows that water must have acted some part at the formation of this deposit. Let us suppose a clayey shore, which is flooded at high tide and left dry at ebb, and behind it a lake to which the tide rises, and flocks of sea-birds which visit the coast at the time of low water; all the requisite conditions are given. Fish and other marine animals, left by the tide, attract the birds, which, in taking their food, at the same time loosen the soil. Meantime a tropical sun dries and breaks up the soil; the tide returns, and carries these loose masses of clay, and the excrements deposited on them, into the basin. In their progress a process of lixiviation takes place; the lighter organic remains, which have not time to subside, are carried away by the effluent water, while the heavier urate of ammonia and fragments of clay subside. At some depth the bottom of the basin is not disturbed by the flood, and here a solution of urate of ammonia may be formed, which subsequently, on drying, covers the layers of clay with a white coating, and serves to unite the pulverulent urate of ammonia and loose clay. The amount of soluble constituents in the guano (20 per cent.) is not opposed to this view, for if the urine of these birds is secreted, like that of serpents, in a concrete form (containing, therefore, solid urate of ammonia), it would be impossible for the salt water to deprive it of much of its soluble constituents during its transfer, and its rapid subsidence in the basin would prevent subsequent extraction. Now it is quite evident that the African guano has been exposed to entirely different conditions to that of the Peruvian just described; for while this contains the enormous amount of 59 per cent. uric acid, scarcely traces of it occur in the former, it having undergone total decomposition. Moreover, the amount of soluble constituents in the African Guano (above 60 per cent.) entirely excludes all idea of its having been subjected to any such lixiviating process as that supposed by Dr. Fritzsche. We may, in conclusion, venture a few words with respect to the comparative value of the African guano as a manure. This depends, first, on the amount of phosphates, and secondly, on that of the ammonia, or substances capable of affording that ingredient. But it is also evident that the state in which the nitrogenous compounds are contained in the manure must be of some importance, *i. e.* whether they exist in the form of ammonia, as is the case with the guano submitted by us to analysis, or in the state of uric acid.† It is probable that this African guano would prove extremely stimulating to vegetation at first, but that its power would soon be spent, unless previous to its employment it were mixed with some substance capable of fixing the ammonia, such as gypsum or charcoal, as recommended by Boussingault and Payen; while that containing uric acid would, from the slow decomposition of this substance, prove for a long time a constant source of nitrogen proportionate to the growth of the plants.—*Chemical Gazette.*

* "Bulletin de l'Acad. de Petersbourg," I. No. 6

† "The value of a manure depends, therefore, on the proportion of nitrogenised organic matter, and especially in relation to the non-nitrogenous organic substances, and lastly, on the decomposition of the quaternary substances being gradually effected, and so keeping pace with the progress of vegetation." And again, "A manure entirely decomposable into its soluble and gaseous products in the course of a single year will be capable of producing as great an effect on the first crop as five times the quantity of another manure which would require five years for its ultimate decomposition, but then the latter will furnish useful products during a period five times longer."—*Payen and Boussingault in "Ann. de Chim. et de Phys.,"* t. iii. pp. 67 and 70.

Employment of Boys as Farm Labourers.—Gangs of boys from 10 to 15 years of age are constantly employed, at wages from 4*d.* to 8*d.* each per day; with every 10 or more boys a man is placed, who is made responsible for their properly executing the work, and also for their application. Narrow hoes are used in preference to wide ones. The Wheat, Beans, and Peas first receive attention, and are all thoroughly hoed and weeded at a cost of about 3*s.* to 4*s.* per acre; the boys also dibble in the Mangold-seed, and single the plants of both that and the Turnips ready for the hoe, weed all the Lent corn, each being furnished with a glove, and then assist in making the hay, shaking it out with their hands without using forks; the smallest are then released for the month of harvest, to follow gleaning, and the largest are all kept to various work, such as hoeing and cleaning the Turnips, and assisting in the harvest-work as required, but always accompanied by the man. As the season advances, the pulling and carting of the Turnips again occupies them, and it is only during the depth of winter that the smallest are not employed. Frequently two or three gangs of from 10 to 15 in each gang are at work; the light hoeing is thus executed at a less cost than could be effected by men, and the boys are at the same time taught early to work and to become industrious.—*Mr. Baker, on Essex Farming, in the English Agricultural Society's Journal.*

Notices to Correspondents.

Rural Chemistry. By Edward Solly, Esq., F.R.S., Experimental Chemist to the Horticultural Society of London, Hon. Mem. of the Royal Agricultural Society, and Lecturer on Chemistry at the Royal Institution, has been reprinted from the *Gardeners' Chronicle*, with additions, and may be had of all booksellers, price 4*s.* 6*d.*

Books.—*Ebon.*—Low's "Elements of Practical Agriculture." The subject of dibbling Corn shall be attended to.

Chinese Oat.—*N. N. P* asks for information as to where he can obtain the Chinese Skinless Oat.

Churn.—*Anon.*—Next week.

Dairy Vessels.—*Hacienda.*—We have no experience on the deleterious effects of zinc on milk, but we believe the assertion to which you allude to be true. The acids formed or existing in milk are solvents of the metal. We do not know the medicinal properties of sea-water.

Decrease in Value from Inundations.—*Maillow.*—We cannot answer your question in our ignorance of the amount of risk to which you are subject. In certain districts bordering on the Severn, at one stage of its course, an inundation involving the total destruction of the crop once in ten years is calculated on; here the effects of liability to such risks obviously affects the value of property simply to the extent of 1-tenth.

Drains.—*H. C.*—Use soles to your draining-tiles; about Ononis arvensis, see Home Correspondence.

Old Pastures.—*W. C.*—Decidedly the best way of breaking them up is by paring and burning. This could be done in spring before Turnip seed-time. You will not otherwise be able to get the land reduced sufficiently for the proper cultivation of the crop. You are certainly judicious in taking a crop of Turnips as the first after Grass. If you pare and burn you may grow Clover on the third year as you propose. The flesh of the alpaca is spoken of as resembling venison.

Potatoes.—*Suburban Farmer.*—If the stalks or haulm are green you cannot cut them off without injuring the crop.

Seed-Wheat.—*J. E.*—The Chidham Wheat is a prettier Wheat in the berry than Mr. Morton's, but so far as our somewhat limited experience of it goes, it is not so productive a variety. Shirreff's Hopetoun is a white Wheat and we should greatly prefer it to the Red Lammas. Will you favour us with your name and address?

Turnips.—*Brassica.*—They can only be propagated by seed.

*** As usual, many communications have been received too late.

Markets.

SMITHFIELD, Monday, Sept. 9.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3s	10	to 4s	0	Best Downs & Half-breds	3s 10	to 4s 0
Best Short Horns	3	6		3 10	Best Long-wools	3 6	3 10
Second quality Beasts	3	0		3 4	Ewes and second quality	3 0	3 4
Calves	3	4		4 0	Lambs	3 8	4 4
Pigs	3	4		4 4			

Beasts, 3217; Sheep and Lambs, 33,070; Calves, 151; Pigs, 370.

The number of Beasts to-day is much smaller than last Monday, yet there is a fair average supply; the trade is rather brisker, and in some instances the very best qualities are making 2d per 8 lbs advanced price; as a general statement of the market, however, we cannot alter our last quotations; the second quality Beasts find more purchasers than of late, and make a little better price. There are a few less Sheep, but still a very large supply; there are, however, more buyers in the Market than of late, which causes the trade to be a shade better; still, there is not a quotable advance in the price. There is a little more demand for Lambs. Pork-trade is rather better.

Friday, Sept. 13.

The supply of Beasts to-day is large, and trade very dull at fully 2d per 8 lbs lower than on Monday; 3s 10d is quite the top price for the best qualities, and many good Beasts are sold at 3s 8d per 8 lbs. The supply of Sheep continues about the same, but owing to the improved state of the dead markets since Monday, the best qualities are making a little more money, but not quite 2d per 8 lbs advance; middling quality is still difficult to dispose of. Veal-trade is a little more lively, but it is difficult to make over 4s per 8 lbs of anything. Pork-trade continues pretty good.

Beasts, 957; Sheep and Lambs, 8330; Calves, 323; Pigs, 330.

41, West Smithfield.

HOPS, Friday, Sept. 13.

About 500 pockets of the new crop of Hops have arrived at Market, for the most part diseased and unripe, and consequently are not much in demand; what few have been sold have realised about as follows:—Farnhams, 10*l* to 10*l* 10*s*; Mid Kents, 9*l* 10*s* to 10*l* 10*s*; Weald of Kents, 7*l* 7*s* to 9*l*; Sussex, 7*l* to 8*l* 8*s*. We expect picking will be general on Monday next, and that the Market will be well supplied during next week. The duty is estimated at 130,000*l*., and no doubt prices will be high.

Pattenden & Smith, Hop-Factors.

HAY.—Per Load of 36 Trusses.

Smithfield, Sept. 12.

Prime Upland Hay	95s to 100s		Clover	100s to 120s	Straw	26s to 30s
Inferior ,,	85	90	,, New	100 120		
New Hay ,,	80	100

			,, Inferior	—	—	

WOOL.—British, Friday, Sept. 13.

There continues to be a good deal of business done in our English Wool Market. The prices of Fleece Wools remain unaltered. We think the Market for Combing Wools a little flatter, but for low short Wools, particularly skin, there has been a good demand.

	per lb.					per lb.	
Long-wooled Wethers	1s	0d	to 1s	1d	Southdown Hoggitts	1s 1d	to 1s 3d
Do. Hoggitts	1	1		1 3½	Kent Fleeces	1 1	1 2½
Southdown Fleeces	1	0		1 1			

James Perrin, Wool Broker.

COVENT GARDEN, Sept. 11.—The supplies of fruit and vegetables have been very large and considerably greater than the demand; trade is consequently dull. Some fine specimens of Pine Apples are in the Market, and hothouse Grapes are also good and abundant. There is no difference in the price of Melons since our last report. Peaches and Nectarines continue good, and are sufficient for the demand. Of Pears there are some good samples of Coe's Golden Drop; Green Gages are almost over for a season, and Orleans are very scarce. Of Damsons there is abundance. Figs are offered at nearly the same price as last week, and very little alteration has taken place in that of either Apples or Pears. Amongst the latter we noticed some good samples of Ribston Pippin, Hawthornden and Emperor Alexander, and amongst the latter were fine looking specimens of Williams's Bon Chrétien, Black Worcester and Louise Bonne (of Jersey). Siberian Crabs are now in the market, as are also Walnuts, which are selling at from 16*s.* to 28*s.* per bushel. Filberts are well supplied. Of Vegetables there is abundance. Cauliflowers bring nearly the same price as last week; they have somewhat improved in quality. Broccoli is tolerably plentiful, and Cabbages and Greens are abundant. French Beans are good, and still continue sufficient for the demand. Onions are plentiful. Capsicums and Mushrooms are not altered in price since last week. Carrots and Turnips of good quality are abundant, as is Celery. Lettuce, Endive, and other kinds of Salading are plentiful. We observed amongst Cut Flowers, Combretum purpureum, Gardenia psittacinus, Gardenia radicans, Agapanthus umbellatus, China Asters, Amaryllises, Camellias, Heaths, Pelargoniums, Fuchsias, Verbenas, Carnations, and Roses.

FRUITS.

Pine Apple, per lb.,	2s	to	6s

Chervil, per punnet,	2d	to	3d
Chilis, per 100,	1s 6d	to	2s

MARK-LANE, Monday, Sept. 9.

The supply of English Wheat this morning from the home counties was small, and taken off slowly at the prices of this day se'nnight: Foreign met a moderate retail demand on the terms of last Monday, being rather over those of the forced sales made at the close of Friday's market.—English Barley must be written 1*s.* lower: Foreign meets a slow sale, and barely maintains late rates.—Beans fully support our quotations.—White Peas are unaltered; Grey and Maple 1*s.* cheaper.—The Oat trade is firm, and last week's prices readily obtained.—The top price of Flour is reported to 44*s.*

TO NURSERYMEN AND SEEDSMEN.

TO BE SOLD BY AUCTION, by Mr. SIMPKIN, (without reserve), on MONDAY, the 23d of SEPTEMBER, 1844, at 10 o'clock in the forenoon, on account of the decease of Mr. RICHARD TODD, the late proprietor, all the Shrubs, Forest Trees and Plants, Shop and House-Fixtures, Greenhouse, &c., situate on the Leicester-road, Loughborough, in the county of Leicester.

TO GARDENERS, NURSERYMEN, AND OTHERS.

TO BE LET, with immediate possession, within 20 miles of London, a small NURSERY, and PUBLIC-HOUSE doing a good business. The Nursery is well stocked with choicest American Shrubs, Fruit, and other Trees; is situated within a few minutes' walk of a railway station. Every particular can be procured by application to Mr. KERNAN, 4, Great Russell-street, Covent Garden; and Mr. NEAL, Nurseryman, Wandsworth Common. No person without capital need apply.

VERY ELIGIBLE FARM.

TO BE LET on LEASE, from Michaelmas next, Forest Lodge (otherwise Lloscoed), six miles from Brecon, and 15 from Merthyr; containing 700 Acres of Land of the best quality, and in excellent condition. It has a Threshing machine and a Corn and Bone-mill, all worked by water; extensive Barns and Cattle-sheds, a very large Piggery, a Steaming-house, Liquid Manure Tank, and all requisites for the scientific cultivation of the Farm. An excellent Sheep-walk of 700 acres can be attached, if desired. The whole is well situated as to roads.—Apply to Mr. DRAYCOTT, Glanusk, Lenny Bridge, Brecon; or to Mr. LARGE, Bassel Down House, Swindon.

HORTICULTURAL BUILDING & HEATING by HOT WATER.

J. WEEKS and Co., ARCHITECTS, &c., Gloucester-place, King's-road, Chelsea, Hothouse-Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry, that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c. by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & C. have also to state that at the request of numerous friends they are now making their Boilers of Iron as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & Co. beg to inform the Trade that at their Manufactory in New Park st., every article required for the construction of Horticultural buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field, and Garden Fences, Wire Work, &c. &c.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the constant supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Rust Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orangeries or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

GUANO (GENUINE PERUVIAN & BOLIVIAN.
ON SALE, BY THE ONLY LEGAL IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
WM. J. MYERS AND CO., LIVERPOOL;
And by their Agents,
COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, Sept. 13, 1844.

GUANO for SALE, in Bags of 1 cwt. each, just landed, with a succession of cargoes to arrive.—Successive years' experience has unquestionably proved that Genuine Guano is the simplest, cheapest, and best Manure within the reach of the Agriculturist. The only reasonable anxiety which now remains is to procure the Guano unadulterated, and to obtain such practical directions for using the Manure as shall fully develop its productive powers. To secure to buyers these indispensable requisites, with each purchase will be given a warranted chemical analysis of quality, and also a copy of the recently-published Pamphlet, "Practical Instructions for using Guano as a Manure, illustrated by Practical Results."

Large parcels will be delivered direct from the ship or waterside premises; smaller quantities may be had at the warehouses, 24 and 25, Billiter-street, or delivered within any reasonable distance at a trifling additional cost. Apply to JAMES CLARK, 24, Billiter-street.

POTTER'S GUANO MANURE is the only Guano that can positively be depended upon, and has stood the test of three seasons. The imported article, it is well known, is seldom twice alike, even when genuine, and is subject to a most extensive system of adulteration. Orders addressed early to the Works, 28, Upper Fore-street, Lambeth, will have instant attention. Testimonials will be sent per post, if required.

POTTER'S LIQUID GUANO may be had as usual of most Chemists and Seedsmen.

*** Beware of being imposed upon by inefficacious imitations.

MANURES.—The Readers of the *Gardeners' Chronicle* must have noticed the complaints constantly made there of the Adulterations of Manures, and which are now carried on to a fearful extent.

The Advertiser, a Broker of the City of London, and in daily communication with several scientific Chemists, calls the attention of the Nobility, Agriculturists, and Farmers to his method of supplying Manures, by which a genuine article is secured. Each article is Analysed, and the Analysis forwarded to the purchaser, who can by this means obtain redress should the article differ from the Analysis.

Terms, Cash and one per cent. commission for buying and forwarding.

A register will be kept of the Analysis of every cargo of Guano imported into London that is brought in the market.

Price-current, London, Sept. 7, 1844:—

Bones	p. ton	£4	10s.	0d	Nit. of Potash	p. cwt.	£1 4s. 6d
,, crushed, 5l. 10s. to		6	0	0	Oil of Vitriol, or Sulph. acid	p. lb.	0 0 1
,, calcined		7	0	0	Rape Cakes	p. ton	4 15 0
Carbonate of ammonia	p. cwt.	2	15	0	Salts, Epsom	,,	9 0 0
Guano, Peruvian, p. tn.		10	0	0	,, Glauber	,,	7 0 0
,, Ichaboe	,,	6	0	0	Sulphate of Ammonia, per cwt., 16s. to		0 17 0
Gypsum	,,	2	0	0			
Nitrate of Soda, p. cwt.		0	14	9			

WM. NORTHCOTT, 13, Rood-lane, Fenchurch-street.

GYPSUM, &c.—Pure Gypsum (Sulphate of Lime) for Compost Heaps, Urine Tanks, Stables, &c.; also Sulphuric Acid, Guano (foreign and Potter's), Rape Cake and Rape Dust, and all other Manures, may be had of the Undersigned.

Synopsis of Prices, and mode of use, on application.

MARK FOTHERGILL, 40, Upper Thames-street.

LIQUID MANURE.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN.

THE attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated, by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed; Garden, Ship, and Barge Pumps; also, those for Distillers, Brewers, Soap-boilers, and Tanners, for hot and cold liquor. Pumps kept for hire, for Excavations and Wells. Buildings heated by Hot Water, for Horticulture, and every variety of manufacturing purposes.

The Trade supplied on advantageous terms, by BENJAMIN FOWLER, Engineer, &c., 63, Dorset-street, Fleet-street, London.

IMPORTANT TO AGRICULTURISTS, &c.

ANALYSES of SOILS, MANURES, and all AGRICULTURAL PRODUCTS, are conducted by Messrs. MITCHELL and FIELD (late Mr. Mitchell), Analytical Chemists, with the view of ascertaining whether the Soil, in which it is proposed to grow any particular crop, contains all that is necessary to produce a luxuriant vegetation; also to estimate the relative value and purity of Manures, and the comparative worth of Farm Produce in general. Gentlemen instructed in Agricultural Chemistry. The course will comprehend the Elements of Analysis.—No. 5 A, Hawley-road, Kentish Town.

HATCHER'S BENNENDEN TILE-MACHINE, Manufactured and Sold only by COFFAM and HALLEN, Engineers, Agricultural Implement Makers, &c., 2, Winsley-street, Oxford-street, London.

This is the most efficient Machine that has been invented for the purpose of making Drain Tiles. Any shaped Tile can be made by merely changing the die, which can be done in a few minutes. It requires but few hands, viz., one man and three boys. With this amount of labour, the product of a day of 10 hours is as follows, viz.:—

1 inch diameter of Tile,	11,000	1¾ inches diameter of Tile,	5,800
1¼ ,, ,,	8,000	2½ ,, ,, ,,	3,200

The Machine is movable down the drying-sheds, so that it requires no extra boys to carry the Tiles, nor are shelves required in drying. It has been in full operation for upwards of four months at Hempstead Park, near Cranbrook, Kent. No charge made for Patent dues or licence. The purchase of the Machine includes free use of it.

DRAINING OF LAND.

THE A LEVEL, designed for the Use of Workmen, in preserving a uniform fall in Drains and Water-courses. In consequence of the approval expressed and the demand made for these Levels at the recent Southampton Show, Mr. BAILEY DENTON has arranged with an eminent London Mathematical Instrument Maker to make them in any number required. Price 30s.

This Level is as accurate as a spirit-level, and so simple, that the workman unable to read can use it with facility. When closed it forms a 5 feet staff.

Orders addressed to Mr. DENTON, Land Agent, 9, Gray's Inn-square, London; or to Mr. CHARNOCK, Wakefield, Yorkshire, will insure a perfect instrument.

WHEAT SOWING.

FREDERICK BRAIN begs to call the attention of the Agricultural world to his GUANO MANURE, prepared expressly for Wheat crops: it abounds in all the ingredients that are necessary for a good grain crop. He particularly solicits persons who found the Foreign Guano a failure last season to give his a trial, it being much more powerful, and free from adulteration, so justly complained of in the Foreign by Agriculturists, as well as by all the leading Agricultural Journals.

Testimonial to Brain's Guano Manure.—"5 A, Hawley Road, Kentish Town, London, Aug. 15, 1844.—This is to certify that we have subjected Brain's Guano to a most patient and rigorous analysis, and find it contains all the necessary constituents of a good manure, and is well calculated to give fertility to a soil which is either naturally barren, or has been exhausted by over-cropping, by supplying the land with those substances which are absolutely requisite to a healthy vegetation: it is not adulterated, and can always be depended on, being of uniform composition.—Signed) JOHN MITCHELL and FREDERICK FIELD, Analytical Chemists, of the Royal Polytechnic Institution, London."

Also, BRAIN'S highly-concentrated LIQUID GUANO, for Grass Lands, Gardens, Shrubberies, Hothouses, and Conservatories, price 1s. 9d. per quart bottle, with full directions for use, (enough for 80 gallons of Liquid Manure), to be had of most respectable Florists, Seedsmen, and Chemists in town and country.

Works, Thomas-st., Duke-st., Stamford-st., Blackfriars-road.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient Protective Material to Plants, and is now in use at the Royal Horticultural Society's Gardens, Chiswick. It can be had of any length, 32 inches wide, at 1d. per foot, super. A discount to the trade. THOS. J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

TO LANDOWNERS, AGRICULTURISTS, BUILDERS, ARCHITECTS, &c.

McKIBBIN'S Improved ROOFING FELT is peculiarly applicable as a substitute for Slate, Zinc, Tiles, and other articles used for Roofing, from its ECONOMY, LIGHTNESS, and DURABILITY.

The disadvantages attending other materials used in roofing, preventing, in agricultural districts, many useful houses and sheds being erected or rendered waterproof, it is submitted that the improved Roofing Felt will in a great measure—and in some instances altogether—obviate them, and prove most serviceable from its lightness, durability, and impermeability to water and damp, in covering Houses, Cattle-sheds, Workshops, Ropewalks, &c., and for the sides, as well as roofs, of light structures for plants, being likewise a non-conductor of heat; besides its economy in repairs, the timber where it is used may be so light as to save its whole expense; it requires no other coping, and may be applied by any person of common ingenuity; being flexible and portable also, it is free from breakage, the expense of carriage is inconsiderable in comparison with slates, tiles, &c., and it is not liable to contraction like zinc.

Sold in sheets 32 inches by 20, at 5d. each (being less than 9s. 6d. per square of 100 feet), with printed directions for applying them.

Orders will meet with prompt attention if addressed to H. C. BOWDEN, 18, East India Chambers, Leadenhall-street, London, or to the following agents:—Liverpool, Messrs. Grueber & Co., 11, Manesty-lane; Plymouth, Thomas Stevens, Esq.; Birmingham, William R. Loyd, Esq.; Sunderland and Newcastle-on-Tyne, Messrs. John Ritson and Sons; Hull, William Ward, Esq.; Bristol, Messrs. Moor and Hewitts; Ramsgate and Deal, Messrs. Edward Hodges & Co.; Whitehaven, William Todd, Esq.; Glasgow, Malcolm Carmichael, Esq., St. Enoch-square; Cork, Messrs. Richard Wallis & Co.; Belfast, Messrs. Grueber & Co., Dunbar's Dock; who have also on sale McKIBBIN'S improved SHEATHING, BOILER, RAILWAY, and other FELT.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. & H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

GLASS MILK PANS, patronised by the ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—Glass Milk Pans have been long and extensively employed in Germany, which led to their introduction in England. The chief advantage is cleanliness, as they require neither scouring nor hot water after use, but are readily rinsed in cold or tepid water.—White Glass Transparent Milk Pans, to hold 8 quarts, 5s. each; Green Glass ditto, ditto, 3s. 6d. each; Ditto, to hold 4 quarts, one-third less in price; Cream Vases, to hold 8 quarts, or 4 quarts, same price as the above; Six-inch Butter Plates, 1s. 6d. each; Condensing Covers, 2s. each; all large sizes, at 1s. 4d. per lb. Manufactured by APSLEY PELLATT, Falcon Glass Works, Holland-st., Blackfriars-road; also sold at the Baker-street Bazaar.

PELLATT'S CONDENSING PROPAGATORS.—The prevention of drip and a moist atmosphere are desiderata in striking cuttings, &c. The above simple invention, by filling the trough with water, alternately evaporates and condenses, and when once filled seldom requires replenishing. Price:—5 inches diameter, 10d. each; 6 inches ditto, 1s. 4d. each; 7 inches ditto, 2s. each. All larger sizes, 1s. 4d. per lb. —Manufactured by APSLEY PELLATT, Falcon Glass Works, Holland-street, Blackfriars Road; and also Sold at the Baker-street Bazaar.

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June* 6, 1844.—The cabin of the Great Western has been regularly supplied with LEA & PERRINS'S Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers for its capital flavour, and as the best accompaniment of its kind for a voyage. (Signed) JAMES HOSKEN."

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup; giving a zest far superior to the long-established favourites; more wholesome and of less cost."—*Naval and Military Gazette*, April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS, Worcester; Messrs. BARCLAY and SON, Farringdon-street; and the principal Oil and Italian Warehousemen in London; and Retail by the usual venders of Sauces.

NATIONAL TESTIMONIAL TO MR. ROWLAND HILL, AUTHOR OF THE PENNY POSTAGE,

Under the management of the

CITY OF LONDON MERCANTILE COMMITTEE ON POSTAGE.

SIR GEORGE LARPENT, BART., CHAIRMAN & TREASURER.

The Committee have the pleasure of announcing to the Public that in compliance with the request very generally made to them from all parts of the country, they have determined to keep open the Subscription to the above Testimonial for a few weeks longer.

The Committee are further encouraged to the continuance of their labours by the success which has hitherto attended them. They feel confident that their object only requires to be made more generally known to insure the active co-operation of all classes of society, for all have derived benefit from the scheme of which Mr. Hill is the Author.

The Subscriptions already received in London amount to 5500*l.* Further sums to the extent of 3500*l.* have been actually collected in various parts of the country, and returns have yet to be received from 200 places, at which 3000 Subscription Cards are yet in circulation.

In the subjoined List will be seen the names of places at which Collections have been made and remitted to London. The inhabitants of Cities, Towns, and Villages, not there mentioned, are entreated to stir themselves in aid of this National acknowledgment of the services of one who has laboured for and established a National benefit.

Where no Committee has been, or can be formed, Subscriptions forwarded by post-office orders or otherwise, to Mr. George Wansey, Solicitor, 3, Lothbury, the Secretary of the London Committee, will be acknowledged, and he will also supply Subscription Cards and afford every information required.

By order of the London Committee, G. WANSEY, Secretary.

London, Sept. 13th, 1844.

Amount previously advertised £3435. 8*s.* 7*d.*

HORTICULTURAL SOCIETY OF LONDON.

This Day is Published, price 3*s.* 6*d.* to Fellows of the Society, and 5*s.* to others.

A CATALOGUE OF THE FRUITS Cultivated in the Garden of the HORTICULTURAL SOCIETY OF LONDON. Third Edition. Sold by LONGMAN & Co., Paternoster-row; J. HATCHARD, Piccadilly; RIDGWAY, Piccadilly; RIVINGTONS, Waterloo-place; and by the principal Booksellers in all parts of the Empire.

A few copies of the Second Edition of this Catalogue may be had at the reduced price of 1*s.* 6*d.* each.

LITERARY LEAVES; or, Prose and Verse. By DAVID LESTER RICHARDSON.

2 vols. 8vo, Second Edition, price 12*s.*

"We strongly recommend this second and enlarged edition. We can easily imagine how such writings as these, appearing from time to time in the Indian journals, must have gratified the English residents, since even here, in the midst of lions and new books, we run over the leaves with unmixed pleasure."—*Atlas.*

"His poetry derives, from his unfeigned attachment to home, a very touching beauty. Most persons who have been long absent from the place of their birth know how delicious is the feeling with which it is approached. Mr. Richardson describes this feeling with exquisite truth and tenderness .... Whatever forms of nature challenge his preference, he views them all with a poetical eye, and paints them in his verses with vividness and fidelity. We should be glad to see the poetry of these volumes detached from the prose, and sent into the world alone. It has sufficient character in it to depend on its own vitality; and we venture to predict that it will live."—*Sunday Times.*

"The essays afford some exquisite reading. We can with perfect confidence refer every man of literary taste to these volumes, which we consider an elegant and valuable contribution to the literature of our country."—*Indian News.*

"The poems are largely impregnated with Nature's best and holiest feelings. They are utterances of the writer's own heart, and they reach the hearts of his readers. They leave an impression which will not be easily or speedily effaced. The diction is in keeping with the sentiments; it is at once accurate and graceful. The same observation applies to the author's prose writings."—*Observer.*

SMITH, ELDER, AND Co., Cornhill, London.

ADVERTISEMENTS IN THE MONTHLY JOURNAL OF MEDICAL SCIENCE, Edited by Dr. CORMACK. Few Periodicals present such advantages to the Advertisers of Medical and Scientific Publications, Works in General Literature, Medical Practices, Chemical Products, Pharmaceutical Preparations, the Prospectuses of Life Insurance Societies, &c. The circulation is large, and has from its commencement gone on steadily increasing in Great Britain, Ireland, India, America, and the Continent of Europe. It is taken in by many General News-rooms, by almost all of the Reading Clubs and Medical Societies in Town, and by a very large proportion of Country Practitioners, in England, Scotland, and Ireland, to whom, from its cheapness and comprehensive character, it is specially adapted. Advertisements inserted in this Journal must be seen by many thousands of the most select class of readers.

*** For the SCALE OF CHARGES, and all other particulars, reference may be made to Mr. Churchill, Princes-street, Soho, London; Messrs. Maclachlan, Stewart, and Co., South-bridge, Mr. Jack, Niddry-street, Messrs. Harthill and Son, Waterloo-place, and Mr. Seton, Head of the Mound, Edinburgh; Messrs. Fannin and Co., Dublin; most News Agents in Great Britain; and Messrs. Fortin, Masson, et Cie, Paris.

Printed by WILLIAM BRADBURY, of No. 6, York-place, Stoke Newington, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the county of Middlesex, Printers, at their Office in Lombard-street, in the precinct of Whitefriars, in the City of London, and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-Garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, September 14, 1844.

The Newspaper.

SATURDAY, SEPTEMBER 14, 1844.

VICTORIA LIFE ASSURANCE COMPANY.—*Trustees.*—Sir Jas. Duke, Ald., M.P., Chairman. Benjamin Hawes, Esq., Deputy Chairman. Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.

Advances made to assurers on real or undoubted personal security, for terms of years, re-payable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary.

WILLIAM RATRAY, Actuary and Secretary.

GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY. 14, WATERLOO PLACE, LONDON.

The Chisholm, *Chairman*. W. Morley, Esq., *Deputy Chairman*.

PECULIAR ADVANTAGES OFFERED TO POLICY-HOLDERS IN THIS INSTITUTION.

An extremely low Rate of Premium, without participation in the Profits, but with the option, at any time within five years, of paying up the difference between the Reduced Rates and the Mutual Assurance Rates; and thus becoming Members of the Society, and entitled to a full participation in the Profits.

Extract from the Reduced Scale of Rates, for an Assurance of 100*l.*, for One Year, Seven Years, and the whole Term of Life.

AGE	ANNUAL PREMIUM. ONE YEAR.	SEVEN YEARS.	WHOLE LIFE.

Just Published, price 1*s.*

AGRICULTURE; ITS PRACTICE WITH PROFIT, Elucidated in a Contrast of Oriental and British Usages: in a Correspondence with the Royal Agricultural Society of England. By HENRY NEWNHAM.

London: Published by ROAKE and VARTY, 31, Strand.

TO SPORTSMEN, TOURISTS, &c.

BERDOE'S SUPERIOR WATERPROOF FROCKS, SHOOTING-JACKETS, GARMENTS for the SEA-SIDE, &c.—An extensive variety of the above, in NEW and greatly improved materials always ready, guaranteed to exclude any rain whatever, and confidently recommended to those who regard a respectable appearance, or wish to avoid the disappointment and vexation consequent upon purchasing articles made by slopsellers, and sold by parties not Tailors.

FIRST-RATE CLOTHING of every description, upon the lowest terms possible, consistent with TRUE economy, and ultimate satisfaction.—W. BERDOE, Tailor, Waterproofer, &c., 69, Cornhill (north side).

IMPORTANT to the FASHIONABLE WORLD.—By far the most influential of all the graces that contribute to personal adornment is the Hair. Its recovery, preservation, and improvement proportionably concern the elegantes of our fashionable circles, and any information which will insure these desirable results will be hailed as an inestimable boon. The following extract from the letter of a respectable chemist in Bridlington will be read with the highest interest:—

"A lady, a customer of mine, has found great benefit from the use of your Balm. About six months ago her hair nearly all fell off. I recommended her to try your Balm of Columbia, which she did. In the course of a few applications the hair ceased to fall off. Before she had used one 3*s.* 6*d.* bottle it began to grow very profusely, and she has now a very beautiful head of hair. "I am, gentlemen, yours respectfully,

"WM. SMITH,

"Chemist and Druggist, Market-place, Bridlington.

"To Messrs. C. and A. Oldridge.—March 13, 1844."

C. and A. OLDRIDGE'S BALM of COLUMBIA causes the Hair to curl beautifully, frees it from scurf, and stops it from falling off, and a few bottles generally restore it again; it also prevents grayness. 3*s.* 6*d.*, 6*s.*, and 11*s.* per bottle. No other prices are genuine.

OLDRIDGE'S BALM, 1, Wellington-street, the second house from the Strand.

TO LADIES.

ROWLAND'S KALYDOR.—This Royally Patronised and universally adopted Specific is a balmy, odoriferous, creamy Liquid, composed chiefly of extracts from the most rare Flowers and Herbs of an Eastern Clime. Its discovery was no less singular (by a Lady of rank), than its effects have been felicitous, during the last thirty years. It is the mildest and most efficacious preparation ever known for dissipating Tan, Pimples, Freckles, Discolorations, and other Disfigurements of the Skin. The radiant bloom it imparts to the Cheek, and the softness and delicacy it induces on the Hands, Arms, and Neck, render it indispensable to every Toilet.

Gentlemen will find it peculiarly grateful after shaving, in allaying irritation of the skin, and in rendering it soft and smooth.

Price 4*s.* 6*d.* and 8*s.* 6*d.* per Bottle, duty included.

CAUTION.—The great demand for this article excites the cupidity of *unprincipled Shopkeepers*, who vend the most *spurious trash* as the "GENUINE KALYDOR:"—whereas the genuine article is prepared solely by A. ROWLAND and SON, and the amalgamation of its *costly exotic* materials renders abortive any attempt to discover its component parts—thus proving the imposition of all other articles bearing the title of "KALYDOR." The genuine article has the words "ROWLAND'S KALYDOR" on the Wrapper.

*** All others are FRAUDULENT COUNTERFEITS!!!

THE BEST ENGLISH WATCHES.—A. B. SAVORY and SONS, Watchmakers, 9, Cornhill, London, opposite the Bank, request the attention of purchasers to their stock of London-made PATENT LEVER WATCHES, which are manufactured by themselves, in their own house. In silver cases, with the detached escapement and jewelled, the prices are four and a half guineas, six, and eight guineas each; or in gold cases, 10, 12, 14, and 16 guineas each. The very large stock offered for selection includes every description, enabling a customer to select that which is more particularly adapted to his own use.

RABBIT NETS, SHEEP NETS, FISHING NETS, CAPES, &c.—Long Hare and Rabbit Nets, on Cords 50, 80, and 100 yards long, for catching Rabbits, and going round coverts in shooting. Net to effectually exclude wasps and flies from ripe fruit, and protect the blossom in the early part of the year, 7½*d.* per yard. Strong Sheep-folding Net, 4½*d.* per yard, nearly 4 feet high. Net to act as fences against rabbits, poultry, &c., 2*d.* per yard. Fishing Nets of all kinds from 4 to 400 yards long. Nets to inclose fowls and pheasants, 2*d.* per yard. Travelling Wrappers, 6*s.* each, for the knees and legs; ditto, covered with waterproof, 7*s.* 6*d.* Agent for the Westmoreland Horse Clothing and Blanket Company. A saving of one-third in these articles. Tarpawling Coats and Capes for watchers, keepers, &c., 7*s.*; Capes, 8*s.* 6*d.*; Coats, Coach and Dog-cart Aprons, 12*s.* each, lined and strapped. Garden Frame Covers (tarpawling), 9 feet and 4 feet, 3*s.* each. Waggon Covers, Roofing, Tarpawlings, &c. ROBERT RICHARDSON, Net and Tent Maker, 21, Tonbridge-place, New-road, London. N.B.—2000 second-hand Police Capes for sale, 2*s.* and 2*s.* 6*d.* each, for labourers and farm servants.

EXTIRPATION of the MEALY-BUG, THRIPS, &c.—These pests to Gardens can be readily and effectually extirpated without injury to the most delicate plants, by HEREMAN'S VEGETABLE DILUTIUM, sold in bottles at 5*s.*, 10*s.*, and 20*s.* each, free of carriage to all parts of Great Britain.—Address, with a remittance, either to SAMUEL HEREMAN, Romsey, Hants, or Messrs. MARNOCK and MANLY, Nurseryman, &c., Hackney, who are the sole London Agents.

TERRA COTTA FIGURES, VASES, FOUNTAINS, &c. Manufactured by DOULTON and WATTS, LAMBETH POTTERY, High-street, Lambeth, London.

D. and W., from their experience as Potters, have made considerable improvements in the manufacture of Terra Cotta, the superiority of which over Artificial Stone or Cement is well known. It is subjected to a high degree of fire, which renders it imperishable, and gives it a sharpness and surface which no changes of temperature can impair.

D. and W. are enabled to offer the Terra Cotta at a considerable reduction in price; and Drawings and Designs will be forwarded Gratis, on application.—Architectural work executed.

News of the Week.

THE liberation of Mr. O'Connell and his fellow-prisoners has produced an excitement in all parts of Ireland far surpassing the enthusiasm of Tara and Mullaghmast, or any other of the monster meetings. The news of his release reached Dublin on Thursday night, and spread from one end of the country to the other with inconceivable rapidity. Within a few hours of the arrival of the steamer at Dublin, signal-fires blazed on the mountains of the provinces, and the entire Catholic population gave way to feelings of rejoicing which it would be difficult to describe. The long-cherished impression that, notwithstanding his late imprisonment, Mr. O'Connell was still invulnerable to the law, has derived a greater impulse from the reversal of his sentence than it had before received from any other circumstance in his history; and the result was so unexpected that it was proclaimed by the priests, and by Mr. O'Connell himself, as the work of Providence and not of man. The enthusiasm of the people may be gathered from the accounts which we have given in another page of the procession in honour of the release from prison; but a more important consideration is the course which Mr. O'Connell intends to pursue with reference to his future plans. At the meeting of the Repeal Association on Monday he entered at great length into this part of the subject, and expressed his readiness to try the experiment of a Federal Parliament. In the meantime, however, he proposes the formation of a Preservative Assembly of 300 gentlemen, to meet in Dublin, and control the proceedings of the Repeal Association, much in the same way as the House of Lords is considered a check upon the Commons. Each member of the Assembly must prove his title by handing in 100*l.*—a qualification which Mr. O'Connell considered would so far insure the respectability of the Assembly, that they would be able to treat with Government and stipulate terms. His next step for the attainment of Repeal is to be the impeachment of the Irish Judges and Attorney-General—the latter for the monster indictment, and the former for their conduct during the trials. He also stated his intention to make a tour of the English provinces for the purpose of stating his case and procuring the assistance of the English people in effecting the impeachment. —The Queen's visit to Ireland, which was prominently announced a few weeks since by the Ministerial papers, has been indefinitely postponed; and Her Majesty is now in Scotland, in the midst of those Highland scenes which made her visit last year the most picturesque of Royal progresses. Her Majesty will return to Windsor in about a fortnight in order to receive the King of the French, whose arrival early in October is officially announced.

The settlement of the Tahiti question is the favourite topic of the Paris papers. The first authentic intimation of the settlement of the affair was conveyed by the Queen's Speech at the prorogation of Parliament, but the terms on which the arrangement has been made supply an abundant field for speculation. The Ministerial papers state that the English Cabinet have relaxed in their demands, and that consequently there has been no recall, but the expression of simple regret and an indemnity to Mr. Pritchard. The Opposition papers, on the contrary, contend that even this is too great a concession, and that France has been humbled by acceding to such terms. From Morocco we learn that the Prince de Joinville on the 23d renewed his attack on Mogadore, in order to silence some guns which had renewed their fire upon his ships. This object was soon accomplished, without loss; and the town, according to the Prince's report, was found entirely deserted, and a scene of horrible devastation. — The India mail has arrived this week with accounts from Bombay to the 19th July. They contain the news of a mutiny in a Bengal regiment, the loss of about 80 reapers and irregular horse, surprised by the enemy near Shikarpore, and the expectation of a plentiful harvest in consequence of the abundance of the monsoon rains. Lord Ellenborough was waiting at Calcutta the arrival of his successor. On the 20th May, which is the latest date from China, Sir H. Pottinger was on the eve of his departure for Bombay.

Home News.

HER MAJESTY'S MARINE EXCURSION.—The Queen and Prince Albert, accompanied by the Princess Royal and a numerous suite, embarked at Woolwich on Monday morning on board the Royal yacht for Scotland. The usual salutes were fired from the batteries and arsenal as Her Majesty embarked, and the Lords of the Admiralty and other official personages were in attendance to superintend the arrangements. The yacht left her moorings at 20 minutes past 9, and proceeded at half speed down the river. The Black Eagle, which, as well as the Royal yacht, had her steam up ready to start at a moment's notice, got under weigh at the same time, and followed in the wake of the Victoria and Albert. She was the only Government steamer, among those which had been selected to form the squadron to attend upon Her Majesty, that was waiting at Woolwich; the remainder of the squadron had been previously despatched with instructions to rendezvous and receive Her Majesty lower down the river. At the time the yacht got under weigh to proceed on her destination, the weather still continued unfavourable, so that Her Majesty did not remain on deck more than five minutes. Prince Albert did not go below, but took shelter in the alcove abaft the starboard paddle-box, where he could see the various objects that presented themselves as the yacht pursued her course towards the sea. The Earls of Aberdeen and Liverpool remained in the alcove with his Royal Highness, who wore a blue naval cap with the gold band. Although Her Majesty was unaccompanied by any of the Government steamers, except the Black Eagle, she was attended by several of the most rapid of the river boats, which, notwithstanding the unpleasant state of the weather, were filled with company anxious to accompany Her Majesty during some portion of her voyage. At 10 o'clock the yacht was off Erith. All the steamers proceeding to London, crowded with passengers, as soon as they descried the Royal standard at the masthead of the yacht, passed her as closely as possible, and cheered her on her passage. As she approached Gravesend, Tilbury fort fired a Royal salute. The shores and piers at Rosherville and Gravesend were densely crowded with spectators. Hitherto the yacht had not been going at full speed, but when she had passed Tilbury Fort she increased it to nearly its maximum. The attendant fleet of little steamers now became as much an object of interest to those on board the yacht as during the previous part of the voyage the Royal yacht had been to them. No vessel that encountered the Victoria and Albert last year was able to compete with her or keep company with her for any length of time, when she chose to leave them in her wake. Not so upon the present occasion. The additional speed at which the yacht was propelled did not alter the position of the little river steamers which accompanied her. The Waterman steamer No. 12 headed the squadron, No. 10 followed immediately in her wake, and the Ariel followed her, while the yacht was astern of the whole of them, and in this position onward they sped, literally flying through the water until they reached the Nore, where the Ocean flag-ship at Sheerness fired a Royal salute. The yacht, after leaving the Nore, altered her course and bore up to the N.E., proceeding through the Channel between the Long Sand and the coast, the Eclair steam-frigate, the Black Eagle, and the rest of the Government steamers forming the Royal escort, following immediately in her wake. At half-past 2 the squadron passed the beacon on the Gunfleet Sands, and at 3 was abreast of Harwich, where a Royal salute was fired from Languard Fort. There were multitudes of persons assembled on the beach, but the view of the squadron was very imperfect, the distance exceeding ten miles. At Orfordness, all the fishing smacks belonging to the place and the adjacent villages were moored in a line about five miles off the coast, and crowded with people of all classes, who were determined to give the Queen a hearty welcome. The whole of the crafts being decked out with colours, and the weather extremely fine, the scene was remarkable. At half-past 4 a black cloud of smoke to the southward indicated the approach of the steamers, and soon afterwards the yacht hove in sight, and as soon as she was abreast of the town a burst of cheering welcomed her, and continued until she had passed. Her Majesty was below, but Prince Albert was on deck, with Lord Adolphus Fitzclarence and others, and acknowledged the cheering by bowing and waving his hand. At 5 the Royal squadron was off Aldborough, and about 6 it passed Southwold, at a distance of about five miles from the shore. None of the squadron of steamers were nearer than a mile from the yacht, and at the rate she was proceeding she would soon lose sight of her escort. There were four steamers in the squadron, the Blazer, Eclair, Stromboli, and Black Eagle. The latter vessel, though considered a fast steamer, was upwards of ten miles behind the yacht. The yacht passed Yarmouth at 10 P.M., followed by the other steamers, which every now and then fired blue lights as signals. The yacht had four brilliant lights, one on each paddle-box, one above the funnel, and the other at her bows. The rest only carried lights. The Royal squadron passed Cromer about ½ past 12. At daybreak on Tuesday morning they were abreast of the New Sand Light, near the entrance of the Humber, and at 9 o'clock passed Flamborough Head, the extreme east point of the coast of Yorkshire. The weather was very hazy all the time, and very few persons assembled to witness the sight, as the squadron was not expected to pass till two or three hours after. There was a fine breeze blowing from the westward, but none of the steamers availed themselves of it for setting canvas. At Scarborough considerable preparations had been made to welcome Her Majesty, and a number of vessels had left the harbour at an early hour to meet the yacht. At ten the squadron was abreast of the castle, within two miles of the land, headed by Her Majesty's yacht, with the Royal standard flying at the mast-head, when a Royal salute was fired from the port. After leaving Scarborough the yacht continued the north-west track close in along the coast, passing before 12 the Great Yorkshire Cliff, Robinhood's Bay, and Whitby, where similar demonstrations of loyalty were exhibited. The squadron passed Tynemouth at half-past three close in shore, loudly cheered by the Tyne steamers, which went out to meet Her Majesty with crowds of passengers. The passage from London to Tynemouth effected by the Royal squadron is the quickest on record. The distance, 320 miles, was accomplished in about 29 hours. The yacht reached Seaton Roads at half past 4, and in an hour afterwards was running inside of the Coquet Islands and the coast of Northumberland, the weather still continuing fine with a gentle breeze, and the sea almost a calm. Between Druridge and Alnmouth the squadron was met by numerous small vessels decorated with flags and colours, and a steamer, similarly dressed, filled with company from Warkworth, who hailed the Royal yacht with cheering. Both Her Majesty and Prince Albert were promenading the quarter-deck, accompanied by the Princess Royal, whose appearance elicited the most intense curiosity. The cheering was long and continued, and a salute of several guns was fired from the steamer. Her Majesty and the Prince advanced to the larboard quarter of the yacht, and acknowledged the compliment by repeatedly bowing. At 7 the Victoria and Albert was abreast of Bamborough Castle, one of the squadron steamers still considerably in advance. On clearing South Sunderland Point their course was slightly altered more to the westward, which by 9 brought them in the vicinity of the Fern and Staple Islands, the spot where the Forfarshire and Pegasus steamers were lost. At midnight the light at St. Abb's Head was visible to the south-west, and by 1 A.M. the Royal yacht was abreast of it, steaming inside of the rocky bank in the direction of Fifeness—a point of land at the extremity of the east coast of Fifeshire, which separates the river Tay from the Firth of Forth. Shortly before 2 o'clock, the Royal yacht arrived at the entrance of the Tay, where she was met by the steam ship Perth, brilliantly illuminated, and decked from stem to stern with colours of every description. The Perth had been selected by the Trinity Board House at Dundee to escort Her Majesty up the Tay to Dundee, in accordance with the wish of the First Lord of the Admiralty. The instant the Perth observed the approach of the Royal squadron she fired blue lights and rockets, which were answered by others further up the Tay; and, the atmosphere being remarkably bright, in a short space of time the news of Her Majesty's arrival was known throughout Dundee. The yacht anchored soon after 3 A.M. It was supposed that Her Majesty might land at once, and the authorities, warned by the fate of the Edinburgh magistrates last year, had made every preparation in case of such an event. As soon as the arrival was known, a salute of 21 guns was fired from Broughty Ferry, tar barrels were lit, and rockets thrown up. The Queen, however, did not disembark till the morning was more advanced. At half-past 8, Her Majesty, accompanied by Prince Albert and the Princess Royal and her suite, left the Royal yacht and entered the state barge, which was steered by Lord Adolphus Fitzclarence. At a quarter to 9 o'clock, Her Majesty landed at the quay, where she was received by the authorities. No salute was fired, but this had been determined on for sufficient reasons. The Royal party included the Duke of Buccleuch, the Earls of Aberdeen, Liverpool and Jersey, and their suites. The Black Eagle, the Stromboli, and the Volcano steamers, accompanied the Royal yacht. When Her Majesty stepped ashore the yards were manned, and the scene was animated by the cheering of the sailors. Nor were the spectators behind-hand, for they cheered most loyally. In a few minutes Her Majesty had reached her carriage, and the Royal party drove off through the town amidst the vociferous acclamations of the people. Some were heard to grumble that the carriage was a close one, and that the Queen could not be seen; and, what was to them perhaps as mortifying, that Her Majesty could not see all the gay preparations made for her. The Royal carriages were accompanied by a town procession, and by the authorities, and proceeded with the Queen to Dudhope church, where they took leave of Her Majesty, who proceeded at a rapid rate to Blair Atholl, which place she would reach in less than four hours from the time she left Dundee, or about two o'clock. A guard of honour of the 60th regiment was in readiness to receive Her Majesty on landing, and parties of the Scots Greys were stationed at intervals of six miles on the road to Blair Atholl, which is 50 miles from Dundee, in order to escort Her Majesty as she passed along. A guard of 200 Highlanders, who have been under drill for some time by Lord Glenlyon, will attend Her Majesty at Blair Atholl, where great preparations have been already made for Her Majesty's accommodation.

BAPTISM OF THE INFANT PRINCE.—The Baptism of Her Majesty's second son took place on Friday evening, in the private chapel at Windsor Castle, in the presence of the Queen Dowager, the Duke and Duchess of Cambridge the Grand Duke and Duchess of Mecklenburg Strelitz, the Prince of Prussia, the Duchesses of Kent and Gloucester, the Saxon, Prussian, and Portuguese Ambassadors, and several Cabinet Ministers. The ceremony was performed by the Archbishop of Canter[illegible] by the Bishop of Norwich, the Bishop of O[illegible] Dean of Windsor, the Hon. and Rev. C. L. Courtenay Archdeacon Wilberforce, and the Rev. Lord Wr[illegible]y Russell. The Sponsors were the Duke of Cam[illegible] proxy for Prince George of Cambridge; the Du[illegible]s of Kent, proxy for the Duchess of Saxe Coburg and Gotha; the Duke of Wellington, proxy for the Prince of Leiningen. In the procession to the chapel the Queen led the Princess Royal, and Prince Albert led the Prince of Wales; the Prince of Prussia led the Queen Dowager, the Hereditary Grand Duke of Mecklenburg-Strelitz led the Duchess of Gloucester, Prince Edward of Saxe-Weimar led the Duchess of Cambridge, and the Duke of Norfolk led the Hereditary Grand Duchess of Mecklenburg-Strelitz. The service commenced with sacred music about 6 P.M.; after which the Lord Chamberlain conducted the infant Prince into the Chapel. His Royal Highness was carried by the head nurse, attended by the Dowager Lady Lyttelton, who handed the infant Prince to the Archbishop of Canterbury. His Grace solemnised the rite of baptism, the Duke of Cambridge naming His Royal Highness, ALFRED ERNEST ALBERT. The young Prince was then given back by the Archbishop to Lady Lyttelton. At the conclusion of the service, the choir, accompanied by the organ, sung Handel's Hallelujah chorus; after which the Archbishop pronounced the benediction. The ceremony was concluded at seven o'clock. The Queen and Prince Albert, the Queen Dowager, the Prince of Prussia, and the other royal personages, returned to the corridor in the same order as they entered the chapel. The other visitors proceeded to the grand reception room. A state banquet in honour of the event was afterwards given by Her Majesty in St. George's Hall. The Earl of Liverpool, lord steward of the household, gave the following toasts, the band playing some favourite piece after each toast:—"His Royal Highness Prince Alfred," "The King of Prussia," "The Queen Dowager," "The Queen," "Prince Albert." After dinner, Her Majesty and her guests proceeded to the Waterloo chamber, where an instrumental concert was performed by Her Majesty's private band, and several of the first performers from the metropolis.

THE ROYAL FAMILY.—On Tuesday afternoon the Prince of Wales, Prince Alfred, and the Princess Alice, left the Castle, accompanied by the Dowager Lady Lyttelton, by the Great Western Railway for London. The Hon. Colonel Grey and Mr. Brown, the Surgeon, followed in attendance on the Royal children. At Slough a special train was in readiness, which conveyed the party to the Paddington terminus, from whence they proceeded to the New-cross station, and left by a special train of the Brighton Railway for the Pavilion at Brighton. A large concourse of people had assembled at the Palace to witness their arrival, and, as soon as the train arrived, a Royal salute was fired from the battery, and the bells in the church of St. Nicholas were rung. Her Majesty the Queen Dowager, attended by the Dowager Lady Clinton, Earl Howe, and the Earl of Denbigh, left Bushy House on Monday for the Euston-square terminus of the London and Birmingham Railway, and proceeded by the special train to Witley Court, where Her Majesty intends to reside for several weeks.

DEPARTURE OF THE PRINCE OF PRUSSIA.—On Saturday morning, His Royal Highness the Prince of Prussia, attended by Chevalier Bunsen and the members of his suite, proceeded to the National Gallery, for the purpose of viewing the collection of pictures. After walking through the apartments, the Royal party left for Argyll House, the residence of the Earl of Aberdeen. The noble earl not having returned from Windsor, His Royal Highness proceeded to Apsley House, to take leave of the Duke of Wellington. His Grace received the Prince in the vestibule, and, conducting him up the grand staircase, they entered the principal saloon, where they spent some time in earnest conversation, after which the Prince took leave of the gallant Duke in the most affectionate manner. From Apsley House His Royal Highness proceeded to the house of Sir Benjamin Hall, in Portman-square, to take leave of Lady and Miss Hall, after which the illustrious party returned to the legation to lunch. At 3 o'clock the royal carriages were again in attendance to convey the Prince to Messrs. Barclay and Perkins's Brewery, in Southwark. Here the Royal party were received by Mr. Bevan, one of the members of the firm, who conducted His Royal Highness through the various departments, visiting in succession the "stage," where a complete view of the machinery is obtained, the tun-room, the stores, and the stabling. The Prince appeared greatly pleased with all he saw, and upon taking leave expressed his thanks to Mr. Bevan for the polite attention shown to him. Thence His Royal Highness proceeded to the terminus of the London and Greenwich railway, and having, with his suite, entered a first-class carriage, he reached Greenwich at a quarter past 4. One of the Queen's carriages was in attendance at the terminus, and His Royal Highness drove direct to the residence of Admiral Sir Robert Stopford. The Prince was then conducted by Sir Robert Stopford through the noble institution over which the gallant admiral presides, with all the arrangements of which the Prince expressed himself highly gratified. On leaving the Painted-hall the Royal party proceeded to the Naval School, where the Prince was received by Lieut. Rouse, a gallant veteran, who, having lost a limb in the service, now fills the responsible office of superintendent of the schools. The pupils, to the number of 800, were ranged round the quadrangle in which the model ship is erected, and as the Prince entered the band of juvenile performers commenced playing "God save the Queen," the yards

of the model ship being manned at the same moment by some of the pupils. His Royal Highness subsequently witnessed the pupils' exercise in the gymnasium, and paid a farewell visit to the Princess Sophia, and then proceeded to the Crown and Sceptre Tavern, where a white bait entertainment was given to His Royal Highness by Chevalier Hebeler, the Prussian consul-general, previous to the embarkation of the Prince for Ostend. The juvenile band from Greenwich Hospital, by direction of Sir R. Stopford, was stationed in a vessel on the water, and performed various national airs during dinner. The embarkation, witnessed by an immense concourse of spectators, was accomplished in the barge of the William and Mary yacht. The effect upon the water was particularly interesting, every object being clearly seen by the aid of blue lights from the tavern. Immediately upon His Royal Highness stepping on board, the Lightning got under way amidst the cheers of the spectators, and reached Ostend by 9 o'clock on the following morning, whence His Royal Highness proceeded direct to Berlin.

VISIT OF THE KING OF THE FRENCH.—It is understood that the visit of the King of the French to Her Majesty is now definitively fixed for the early part of next month. His Majesty will embark at Tréport on the 3d of October, and proceed at once from Portsmouth to Windsor. The Queen of the French will not accompany His Majesty; but it is expected that King Louis-Philippe will be attended by two of his Ministers, and by his youngest son the Duke de Montpensier.

Parliamentary Movements.—Mr. Talbot Clifton is the Conservative candidate for North Lancashire, vacant by the retirement of Lord Stanley; and it is supposed that he will be returned without opposition.

Acts of the Session.—In the House of Lords, previous to the prorogation, the Lord Chancellor laid on the table a return of the number of the Royal Commissions assenting to public Bills during the present session; also noticing the dates at which such Bills severally were read the first time in the House of Lords. There were eleven commissions, the last being the 9th August. To that period, inclusive, 105 Bills received the Royal assent, and became Acts of Parliament. Of that number, forty-four, or nearly half, were read for the first time in the House of Lords in the course of July. Eleven were read for the first time in August.

Illness of Miss Peel.—The family of Sir Robert Peel have been in a state of great anxiety during the past week, in consequence of the serious illness of Miss Peel. Sir Charles Clarke, and Dr. Hodgson, of Birmingham, have been in constant attendance upon her at Drayton Manor, and we are happy to learn that a slow improvement is at length perceptible, and sanguine hopes are now entertained that the young lady will eventually recover. Yesterday morning Miss Peel was considered better, after having passed a favourable night; and although all danger could not be said to have subsided, yet her medical attendants were agreed that their patient was progressing towards recovery as favourably as could be expected.

The Army.—Captain Murray, 20th Regiment, tried by court-martial at Bermuda last spring, for intoxication at mess and at a ball, and for disrespect to Lieut.-Colonel Hutchinson, when called on for explanation of his conduct, and for subsequent disobedience of his commanding officer's orders, was found guilty, and sentenced to lose six steps of his rank, and to be publicly and severely reprimanded. The Duke of Wellington has communicated Her Majesty's disapprobation of the finding as to intoxication at mess and ball, not considering the charges proved; the Queen also disapproves the finding on the charge of disrespect to Lieut.-Colonel Hutchinson, as Captain Murray was not bound to answer, in explanation of his conduct, a question likely to criminate himself; but the Queen confirms the finding of disobedience of orders in not attending his commanding officer when called upon by the Adjutant of his regiment. Under all the circumstances, however, considering Captain Murray has been an invalid, that officer is permitted to return to his duty, with only an admonition to be more careful and more respectful.

Foreign.

FRANCE.—The news of the settlement of the Tahiti quarrel, which was first made known by the Queen's speech on the prorogation of Parliament, has caused great sensation in Paris. All the papers advert with great vivacity to the settlement of the differences, and the Ministerial organs are almost as vehement in vindicating the conduct of their patrons as the Opposition prints are in attacking it. The *Débats* and the *Globe* express their delight at "the able manner in which M. Guizot had brought about the arrangement of the Tahiti affair without the most minute concession to the demands of England." It appears, in fact, that the statements of the French Ministerial organs had been perfectly correct. The British Government made no specific demand, and the French Government made only one offer, and took especial care, knowing probably that it was deemed sufficient, to declare that they would not go one inch further in the way of concession. It is said, however, that one single conversion to good feeling in Paris has not been made by this arrangement. Its principal advantage consists in the time it will allow for reflection on the dangers to which over-anxious or over-zealous or troublesome partisans may expose their chiefs, and for preparing in advance for the treatment of similar questions when they shall arise. Unless, however, such have already arisen, they are not likely to occur in haste, for the lesson is said to have been a serious one. The *Débats* says,

"The Opposition Journals asserted that M. Guizot had offered to disavow and to recall Capt. d'Aubigny. They added that England, not satisfied with the sacrifice of M. d'Aubigny, required moreover the disavowal and the recall of the Governor, Capt. Bruat. The entire truth is now known. Has M. Guizot offered to disavow and to recall M. d'Aubigny? No, for M. d'Aubigny is neither disavowed nor recalled. Did the British Cabinet require the disavowal and the recall not only of M. d'Aubigny, but of M. Bruat? Through whatever phases the negotiations passed, there is one thing certain, which is, that the arrangement is concluded, and that Capt. Bruat is no more disavowed and recalled than M. d'Aubigny. We must therefore praise M. Guizot for his firmness if he have refused the double sacrifice demanded of him; and we must praise the English Cabinet for its candour and moderation, if after a more mature examination it admitted that there was on our part a mere error of proceeding in the practice of a right, and consequently relaxed its pretensions. What then happens? This intractable England, which will have war at any price, is satisfied with a regret and a blame expressed by our Government. This Minister of Foreign Affairs of France, who wants peace at any price, has not even offered what the Opposition supposed he would offer. He has not yielded. Reckoning on the wisdom of the Government of England, he adhered to his first propositions, and at last brought Lord Aberdeen and Sir Robert Peel over to them. *No disavowal, no recall! The expression of a simple regret, and the offer of an indemnity to Mr. Pritchard!* Here was an occasion even for the Opposition journals to congratulate themselves upon a result which they must have so little expected. The *National* is of opinion that the hour of our downfall has arrived, and bewails our ruined greatness, and all that apparently because M. Guizot did not offer the disavowal and recall of M. d'Aubigny, and because England did not demand the disavowal and recall of M. Bruat. But we shall not have war; we shall not even have a Ministerial crisis. No, we shall not have war; two great nations will not tear each other to pieces for a futile subject of dispute; two great Governments have had the good sense to come to an understanding in place of obstinately differing about a false point of honour; two Cabinets which pride themselves on having for four years maintained a good intelligence between the countries which they govern, have declined offering to the world the odious and ridiculous spectacle of a policy of peace ending in a war of the most foolish character! Let those bewail whose plans and hopes are deranged by peace! That war which they thought they almost held within their grasp escapes them, and they must now seek another quarrel! For our parts, we hope that the wisdom of the two nations, and the two Governments, will continue to confound their sinister designs! We shall not even have a Ministerial crisis, and that is what afflicts the Opposition, which is only warlike because the Ministry is pacific. The Opposition did not expect so happy and so honourable an arrangement; all that it said for the last fortnight proves it, and the anger it feels at being mistaken proves it still more."

It is only fair to observe, that the Opposition prints of Paris express precisely a contrary feeling, contending that France has been humbled by the terms proposed by M. Guizot, and accepted by the British Government. The *Courrier Français* reckons about 25,000f. the compensation that will be offered to Mr. Pritchard, and one or two other prints of the same party solace themselves with the hope that, whatever its amount, it will be indignantly denied by the Chamber of Deputies. Captain Bruat, it appears, has just been promoted to the rank of a *Capitaine de Vaisseau* of the first class. According to the *Revue de Paris*, Commodore Toup Nicolas and the Commander of the French forces in the Pacific are to act as arbitrators in fixing the amount of the compensation to be awarded to Mr. Pritchard. The English Ministry particularly insists on this point, and appears to rely on it, to justify before Parliament the assurance given by Sir Robert Peel, that the honour of England was safe. It sees with reason, in the indemnity, an admission of the injustice of the measures taken against Mr. Pritchard.—The *Moniteur* contains a long report from the Prince de Joinville of what his Royal Highness designates "the purely military part of his operations on the coast of Morocco." He gives full details of the position of all the ships at Tangier, the number of guns fired, and of the killed and wounded, and goes over the same ground as regards the bombardment of Mogador. In a postcript of the report, dated the 25th ult., his Royal Highness gives an account of the renewed attack upon Mogador on the previous day, some account of which had already appeared in the Toulon papers. The following is the postscript:—

"P.S. On the 23d our establishment on the island was completed, and I sent away to Cadiz a part of the squadron. In the course of the day a gun was fired from one of the towers of the town commanding the country, and the ball having fallen in the midst of us in the port, we destroyed with shells the houses near this tower. I then sent Lieutenant Touchard, the chief of my staff, with 160 men, to fix scaling-ladders against the tower. The detachment scaled the wall without opposition, and spiked the last guns that could play upon us. From the height of the tower the town could be seen; it appeared deserted, and horribly devastated. This operation, which was not absolutely necessary, has had the advantage of showing the garrison of the island, that, with its own forces and the resources of the local station, it keeps the town completely at its mercy."

Two days after this operation, the Groenland, one of the largest of the French war steamers, was totally lost on the west coast of Morocco, on some rocks about three leagues from Larache. The Moors immediately commenced an attack upon the vessel, which had lasted full four hours, when, fortunately, the steamer Vidette arrived to her assistance, succeeded in dispersing the Moorish soldiers, and received on board the crew and such things as could be saved from the wreck. In the afternoon the Prince de Joinville, in the Pluton, also arrived on that part of the coast, and finding it impossible to float the Groenland, caused her to be destroyed by fire. It is supposed that His Royal Highness was steering for Cadiz, to meet the Duc de Glucksberg, who is on some special mission from the French Government, the nature of which has not transpired.

The acquittal of Mr. O'Connell by the House of Lords is the subject of comment in several of the papers. The *Débats* says:—

"After having read the debates in the House of Lords, it must be acknowledged that the manner in which the judgment has been given does great honour to the political and constitutional system in England. The question has been discussed and settled by five persons only; that is to say, by the lawyers of the House; and although all the other Peers of Great Britain, including such of the Ministry as are members of the Upper House, had a right to take a part in the vote, yet, from respect for constitutional customs, they unanimously abstained."

The *Débats* proceeds then to give a sketch of the proceedings which took place in the House of Lords on that memorable day, and which it does with the ability which is always remarkable in its articles upon England, and it concludes with these words:—

"We repeat, that the manner in which the judgment has been given is calculated to give a high idea of English forms and English justice. It is beyond a doubt that the reception of Mr. O'Connell's appeal must be a source of great embarrassment to the Ministry, and yet the Ministry has scrupulously abstained from interfering in the decision of the House, although it could have legally done so. All Peers had a right to vote, and if all had made use of their right, the result could not be doubtful, considering the immense majority that supports the Government in the Upper House."

The *National* takes a very different view of the question. It thinks the acquittal of O'Connell is the effect of the fears of the aristocracy, who are apprehensive of causing too much discontent in "that great nursery of soldiers and sailors." The *National* also says that to France O'Connell owes his release from prison, Ireland owes Catholic emancipation, and the United Kingdom the Reform Bill; and for all these services it is confident that in case of need France will find powerful auxiliaries in Ireland against France's "eternal enemy." The *Siècle* observes that—

"Since the decree of the Court of Cassation, which, after hearing the pleading of M. Odilon Barrot, declared the ordinance which placed Paris in a state of siege illegal, no judicial event has had the same importance as the admission of O'Connell's appeal by the House of Lords. The British Cabinet is much shaken, if not overthrown, by this unexpected blow. Ireland triumphs. Her hero, her father, her liberator is about to be delivered from prison by the majesty of the law. O'Connell, although condemned, still passed for a great jurist; but after all, he was convicted in fact, and a fact is always much in the eyes of men. At present the prestige which encompassed O'Connell as a statesman, as a liberator, as a jurist, is restored in all its splendour. The influence of this man is become irresistible. Ireland must be crushed by the sword, or a capitulation must be made with her."

A new addition to the happiness of the Royal Family and another link added to its chain of connexion with that of Naples is about to be made in the marriage of the Duke d'Aumale with the Princess de Salerno, sister of the King of the Two Sicilies.—The storm which visited several of the English provinces last week was severely felt on the French coast. At Havre the wind was so high, that considerable damage was done to some of the houses, and the rain subsequently fell in such abundance, that carriages could not pass in some of the streets, and the cellars of the houses were filled with water.

SPAIN.—The accounts from Madrid are of the 3d inst. The elections commenced on that day. The preliminary operations proved the great majority of the Moderados over their Carlist opponents, the Progresistas having for the most part retired from the contest. The Ministers were actively engaged in preparing the various bills which are to be shortly submitted to the deliberation of the Cortes, such as the projects of law on the Council of State, the provincial deputations, the reform of the municipal laws, public instruction, the monetary system, the weights and measures, &c. The best possible understanding continued to exist between the Minister of Finance and the Directors of the Bank of San Fernando. The former President of the Council, Senor Antonio Gonzales, had arrived at Madrid to demand a passport to proceed to his estate in Estremadura. Mr. Bulwer had returned from Tangier to Gibraltar; and the Ministerial journals announce that all the differences between Spain and Morocco have been adjusted through his intervention. Senor Cayetano, the Progresista ex-political chief, had been taken out of the castle of Santa Catalina, transferred on board the mail-packet Corso, on the 22d ult., and transported to the Canary Islands, without even the form of a trial.

GERMANY.—Letters from Berlin state that sentence has been pronounced in the first instance against the assassin Tschech, who fired at the King of Prussia. The sentence is said to be, that he be broken on the wheel.—A letter from Vienna, in the *Augsburg Gazette*, states that Prince Charles de Canino, son of Lucien Bonaparte, had arrived there the day after the visit of the King of Prussia, to confer with the celebrated John Muller and M. Heckel, the naturalist, on matters relating to natural history. A letter from Italy, announcing the death of his uncle Joseph, forced him to depart suddenly.

ITALY.—The Dublin papers announce that the British Government have selected the Hon. Mr. Petre, a Roman Catholic, to watch over the diplomatic interests of England at the court of the Sovereign Pontiff. Although Great Britain since the Reformation has never had an ambassador, nor a chargé d'affaires, or even an avowed accredited agent at the court of Rome, her interests have always been guarded, and communications to St. James's made through the instrumentality of Hanover, or the Grand Duke of Tuscany, that duty being committed to an *attaché* belonging to one or other of those embassies, who was a member of the Protestant Church.—A letter from Venice of the 24th August says that Admiral Bandiera has been deprived of his command in the Levant, but that, having been able to satisfy the Austrian authorities of the injustice of the suspicions against him, he is likely to be reinstated. It appears that the admiral's misfortunes are daily accumulating upon him. His wife has died of grief for the dreadful fate of his two sons.

SWEDEN.—The question of changing the law of Parliamentary representation is decided in the negative. The Diet of Nobles discussed on the 28th ult. this important matter from 9 in the morning till 7 P.M., and the result was the rejection of the project by a majority of 450 against 82. In the Diet of the Clergy the Debates con-

tinued on the 29th, but the project was thrown out nearly unanimously. The Diet of the Citizens has adopted the project by a majority of 47 against 9, and also the Diet of the peasants passed it by a majority of 89 against 14, but as the consent of the four Diets is requisite for making any project discussed a law of the empire, the present attempt of changing one of the fundamental laws of the country is therefore frustrated.

DENMARK.—The *Journal des Débats* announces that a deplorable accident occurred a few days since in the study of the late celebrated sculptor Thorwaldsen, at Copenhagen. The colossal model in plaster of an Æsculapius of Thorwaldsen, the last work which this illustrious artist ever completed, and which was intended to serve as a pendant to his colossal statue of Hercules, placed in the museum of Copenhagen, fell to pieces, and was so completely broken that this magnificent specimen is totally lost for all purposes of art.

MALTA.—Considerable excitement prevails throughout all classes at Malta, by the reduction of 4 per cent. in the value of the Mexican and South American dollars, a coin varying very much in weight, originally introduced by the Government ten years ago, as legally current at 4*s.* 4*d.*, and now by the same Government reduced to 4*s.* 2*d.*, a measure which is tantamount to positive spoliation, unheard of in the present day, even in Turkey. But, in addition to this enactment, orders have been given to the several public departments to receive no dollars under 17 pennyweights and 7 grains, a weight which is scarcely to be found, and the consequence is, that trade has been completely paralysed, and an amazing degree of misery and distress has been brought about. It is difficult to say where the evil will end, or how long the patient population will submit to such privations as they are now suffering. The local journals have taken up the matter, and an appeal to Parliament is talked of.

EGYPT.—Accounts from Alexandria of the 19th ult. state that Mehemet Ali had arrived in that city, and his sudden return appears to have been quite as embarrassing to some of his friends as his unexpected abdication. It is said that he shows symptoms of decay to an extent that alarms his Ministers. His proceedings at Cairo after his departure from Alexandria are very curious. A council was held at Cairo on the evening of the 5th ult. of all the Pashas, Beys, and men of influence in the country, to take into consideration the different reasons of complaint his Highness had to make against them; and they all acknowledged at once their guilt of not having duly made his Highness cognisant of their acts, and having done things without his authority; and they also represented their readiness to submit to any punishment which his Highness might be pleased to inflict upon them. Mehemet Ali left them to pass judgment on themselves, and withdrew; and the council came to the determination, at the proposal of Ibrahim Pasha, the president, that he himself (Ibrahim Pasha) should be deprived of one year's salary, and the other members of six month's salary. Mehemet Ali, however, found the award too great, and reduced the punishment to the loss of six months' salary to Ibrahim Pasha, and four months' salary to all the others. After this decision, Mehemet Ali seems to have been quite satisfied, and the profit that his Highness will make by it has been calculated to amount to upwards of 250,000 dollars. His Highness then sent down instructions to Artin Bey, at Alexandria, to inform the five Consuls-General of his perfect re-establishment in health, his renouncement of going to Mecca, and his determination to direct affairs himself as hitherto. On the 6th, his Highness ordered his steamer and returned to Alexandria. On the 17th the dam that closes the mouth of the canal of Cairo was cut. This operation is done when the Nile has risen sufficiently high for the Government to proclaim that it has attained the sixteenth cubit of the Nilometer. In this, however, the people are always deceived, for there is an old law that the land-tax cannot be exacted unless the Nile rises to the height of 16 cubits of the Nilometer, and the Government thinks it proper to make the people believe as early as possible that it has attained this height. The period when the completion or abundance of the Nile is proclaimed is when the river has actually risen about 20 or 21 feet in the neighbourhood of the metropolis, which is generally between the 6th and 16th of August; that is, when there yet remain, of the measure of a moderately good rise in the neighbourhood of Cairo, three or four feet.

INDIA AND CHINA.—The Indian mail of the 31st of July has reached town this week. The mail had been originally despatched on the 19th, but the shaft of the Semiramis steamer, in which it was conveyed, having broken at sea, she was compelled to return under sail, and the mail was then forwarded on the 31st by another steamer. The intelligence is of interest, although the rainy season is not generally the period of exciting events in India. The 64th Regiment Bengal Native Infantry, which was notorious for insubordination when ordered to march for Scinde some months back, has again signalised itself by an open mutiny on the 20th and 21st June, at Shikarpore, where it was stationed. In consequence of some misunderstanding from promises made by their Colonel, the men, on being offered their pay on the 20th, refused it, alleging that they had been promised more. An officer reported the refusal to General Hunter, commanding there, who instantly went to the parade-ground, and ordered the men to receive their pay, but none but the Native officers would take it, and with the exception of two companies, the men broke off and caused confusion. The General was hooted, their commanding officer pelted with bricks, and an officer was kicked. They then went to their quarters. The General sent for aid to Sukkur, and ordered the mutinous corps to attend morning parade. The men assembled, and fell into rank. The General formed them into open column, and read the general order granting them certain allowances, and asked them to take their pay, which they did. This occupied two hours' time; when the payment was ended, and they were ordered to go to their lines, they all, except three men, piled their arms, and demanded to be discharged. The General had taken his precautions, and the refractory regiment was subsequently disarmed and compelled to quit Shikarpore, and to march to Sukkur, which it reached on the 26th June: and 39 of the ringleaders have been arrested. The 69th Bengal Native Regiment took the station at Shikarpore on the 24th. The mutineers have been ordered to march to Delhi, where it is expected they will be punished and disbanded. The conduct of the officers in command has been much canvassed, and Colonel Moseley has been suspended. A party of 40 cavalry, sent out about 12 miles from Shikarpore to protect a body of grass-cutters, was attacked by some Beloochees in the pay of Shere Mahommed, in consequence of the neglect of the native officers commanding, who retired from the road to smoke with their soldiers. The grass-cutters and 12 men and 1 native officer were killed by the assailants. This had produced a stringent order from Sir C. Napier. Scinde was otherwise tranquil. There was still some fever, and it was said that Sir C. Napier had suffered from some attacks of it. In Lahore the nominal ruler, Heera Singh, had added something to his influence by expelling all foreigners from the service, and by conciliating the officers who have succeeded them. He is described as being much pleased with the removal of Lord Ellenborough from power in India. The reports from Affghanistan are conflicting. Dost Mahommed appears to be exerting himself to the utmost to strengthen his position. His son Akhbar had been created Wuzeer, but was described as in delicate health, being supposed to be in a decline. There were intrigues carried on against the Sikhs, which are likely to produce hostilities between them. Rumour spoke of the conquest of Herat by the Persians, but nothing certain was known on the subject. The Hindostan, having Sir Henry Hardinge on board, left Aden at noon on the 6th July, and touched at Madras on her way to Calcutta on the 20th. His Excellency did not land there, but received a letter from Lord Ellenborough, who announced his intention of not leaving Calcutta until after his arrival, which would be about the 24th. The removal of Lord Ellenborough from the government had produced a modified declaration in his favour in some quarters, but generally it was regarded with indifference. His lordship was expected to leave Calcutta in the Tenasserim steamer in the beginning of August, but of this nothing positive was known. The ship Cameo, from Liverpool to Calcutta, with a cargo valued at 60,000*l.*, had been lost off Kedgeree, and the Candahar, from China, had been totally wrecked near Bombay. In Bombay there was a trial going on of 18 Parsees for a murder committed at two o'clock in the day, in one of the most public streets in the town, on the principle of the gang murders which degrade India. Great excitement prevailed on the subject; the murdered man was one of their own tribe, and yet much money was expended in the hope of preventing the conviction of any of the parties. Public attention in Bombay was drawn to a plan for making a railway to the Thull and Bhore ghauts, two great passes in the mountains of the neighbouring Concan country, by which all the trade comes to that port. The cost is estimated at 350,000*l.*, and a large number of shares were taken there. The news from China is to the 21st June. Sir Henry Pottinger left China on that day in Her Majesty's steamer Driver, for Bombay, and intended to leave Bombay for Suez by the September mail. There is no particular news from China. Hong-Kong was healthy. The French Embassy proceeding to China had anchored at Singapore two hours before the Driver left that port. The new Governor of Hong-Kong, Mr. Davis, with his suite, landed there on the 8th May, and was immediately sworn into office. Some disturbances had occurred at Canton between the Chinese and the Americans, but they were of trifling import. Piracy prevailed on the Chinese coasts, especially of small boats.

CITY.

Money Market, Friday.—Consols closed at 99¾ for Money, and 99⅞ for the Account; Exchequer Bills, 74 to 76 prem.; India Bonds, 96 prem.

GAZETTE OF THE WEEK—BANKRUPTS—A. J. WARRILLOW, Clerkenwell, dealer and chapman—J. HOOK, Nine Elms, brick merchant—T. SEDGWICK, Leeds, grocer—G. BRADSHAW, Welchpool, Montgomeryshire, linendraper—D. and H. DAVIES, Asylum-road, Old Kent-road, road contractors—T. and J. JONES, Liverpool, tallow chandlers—J. S. HOLMES, Liverpool, merchant—J. & D. SUGDEN, Yorkshire, fancy cloth manufacturers.

BANKRUPTCY ANNULLED—J. SISON, Brighton, dealer in toys.

SCOTCH SEQUESTRATIONS.—J. SHIELS, Edinburgh, baker—J. MILLER, Uphall, mining engineer—R. FRASER and SON, Edinburgh, tailors—D. KIER, Irvine, slate-merchant.

Metropolis and its Vicinity.

Bank Forgery.—Some excitement was caused at the Stock Exchange on Monday morning by the discovery of another fictitious transfer of stock, the sum involved in the present case being, it is said, 8000*l.* It seems that a clerk in one of the Bank offices—not that in which the fraud was effected—asked leave to be absent from business for a few days. The time allowed him he employed in conducting the forgery. Having by means of his situation learned the name of a stockholder, and the amount of stock held by him, he procured a confederate bold enough to feign that he was the stockholder, and, taking him to the Transfer office, identified him to the clerk at the transfer-book as the proper party. It is the practice of the Bank to consider their own clerks as the most fit persons to identify a stranger, and therefore, when the clerk at the book saw that the pretended stockholder was identified by a party belonging to the establishment, there was nothing to create distrust in his mind, or to prevent the transfer from taking place; indeed, for some time prior to the transaction, the clerk who had contrived all had given notice that the stockholder, who, as he falsely said, was a friend of his, was about to make a sale. The broker who made the purchase attended in regular course, the sham stockholder signed the transfer, and the clerk who identified him, witnessed the transaction. Had this clerk attended to his duties on the day when this fraud took place, he would, probably, have been unable to absent himself from his own office, and therefore, the leave of absence was necessary to place him in a condition to carry on his scheme with perfect freedom. The pretended stockholder having received a check for the stock sold, took it to the proper department and obtained the amount in gold, when he expressed surprise that he could not get it. This showed inexperience in such matters, but it does not seem to have excited suspicion, and one of the Bank porters assisted him to convey the bags to a cab. The clerk, at the end of his leave of absence, did not return, and an inquiry was instituted into the manner in which the business of his department had been conducted. Among other things, it was perceived that, but a few days before his departure, he had identified a transfer of stock to a rather considerable amount. On a comparison of documents, it was found that the signature of the party who had attached his name to the transfer did not at all correspond with that of the proprietor of the stock. Further and more minute inquiry now took place, when it was ascertained that both the person transferring, and the Bank clerk who avouched the accuracy of the signature, had absconded. The forgery of powers of attorney has been comparatively common, but it was hardly supposed possible that a person could be found possessing nerve and assurance enough to pretend in person to be a stockholder of so large a sum at such immense risk of detection. Without collusion on the part of some person connected with the establishment that could supply the requisite information, it is thought that it would have been absolutely impossible. As some erroneous statements have appeared in print relative to this affair, it is as well to state that the gentleman who is the real holder of the stock, and whose signature has been forged, is named Oxenford. The name of the clerk who has absconded, is Burgess.

Post Office.—An order was affixed on the walls in the General Post-office on Monday last, to the effect that "The Postmaster-general having had the papers laid before him relating to the gross conspiracy which existed amongst the letter carriers, Tapson, Saunders, Long, Bell, Walker, Skinner and Croskell (who have been in the habit of opening the letters of sporting gentlemen), his lordship has been pleased to dismiss them the service."—Aug. 12.

Election of Chamberlain.—Mr. Heppell the candidate who has opposed Alderman Brown in the contest for this office, having persisted in prolonging the poll to the longest period allowed by law, the polling continued daily until Thursday, when the numbers were—Ald. Brown, 2319; Mr. Heppell, 67. The official declaration of the poll takes place this day, when Ald. Brown will of course be declared duly elected.

The Vacant Aldermanic Gown.—Mr. Thomas Sidney, Sheriff-elect, and the wealthy tea-dealer of Ludgate-hill, has canvassed the ward of Billingsgate for the aldermanic gown, which will be resigned by Alderman Brown, the new chamberlain. Mr. Sidney is respectably supported, and having obtained a large proportion of promises from the voters of the ward, his ultimate success is a matter of certainty. Mr. Sidney promises to dispense the patronage which may fall into his gift among the inhabitants of the ward.

Abridgment of the Hours of Business.—The most respectable booksellers, grocers, chemists, milliners, &c., and other shopkeepers, excepting provision and refreshment shops, have commenced now to open at 7 in the morning and close their doors at 8 in the evening, excepting Saturday night, then one hour later, and they are making arrangements to close at 7 during November, December, January, and February.

Robbery.—A mysterious robbery was committed last week, the particulars of which are as follow:—Robert Reeve, a messenger in the service of the Great Western Railway Company, and in whom great confidence has been placed, for some time back has been in the habit of conveying daily a large chest of money from the Paddington terminus to the banking-house of Glyn and Co., Lombard-street; and on Thursday-week was intrusted with between 1300*l.* and 1400*l.*, nearly 900*l.* of which was in gold and silver, and the rest in notes. The property was deposited in a leather case made for the purpose. The case, which was securely locked, and had a brass plate with the inscription "G. W. R." thereon, was put into a blue bag, when Reeve, having taken possession of it, jumped upon an omnibus waiting in the yard, and almost at the same time five other persons also seated themselves on the outside. As soon as Reeve had taken his place, he was called to by a gentleman holding a high situation in the company who wished to speak to him; he accordingly alighted, leaving his bag on the roof, and in less than a minute resumed his seat. The omnibus then proceeded on, and two of the five passengers got down, after riding but a short distance, in

Chapel-street, Edgware-road. The other three alighted near Baker-street. On the vehicle reaching the Bank, Reeve made the best of his way to Messrs. Glyn's, when it was discovered that another blue bag had been substituted for that belonging to the Company, and that the former was partly filled with pieces of lead, and other rubbish of a weighty description. The two Foresters and other officers are actively engaged in investigating the transaction.

Lighting the Metropolis.—The following curious statistics, prepared by one of the principal gas companies, will give some idea of the means at present employed for lighting London and its suburbs:—There are 18 public gas-works, conducted by 12 companies; their capital amounts to above 2,800,000*l.*, employed in pipes, tanks, &c. The revenue derivable therefrom is estimated at 450,000*l.* per annum. There are about 180,000 tons of coals used annually; there are 1,460,000,000 cubic feet of gas made; 134,300 private lights, 30,400 public lights; 380 lamp-lighters, 176 gasometers, several of them double, and capable of storing 5,500,000 feet; and about 2500 persons are employed in various ways.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Sept. 7: West Districts, 157; Northern, 162; Central, 148; Eastern, 205; Southern, 243; Total, 915. Weekly average for the last five years, 946.

Provincial News.

Thunder-storms.—The local papers in many of the provincial districts are filled with accounts of severe thunder-storms which prevailed very generally from Thursday to Sunday last. In Staffordshire, Cheshire, Gloucestershire, Herefordshire, and the adjacent counties, the storm took place on Thursday afternoon and lasted for several hours, accompanied by heavy rain and hail, which caused great damage to houses and other descriptions of property. The Hereford papers state that at Mynde Park, Much Dewchurch, hail-stones of such large dimensions fell that upwards of 300 panes of glass were shattered in the hothouses, &c. At Manchester and the neighbourhood the storm commenced on Friday, and at Hazel Grove the overflow of the rivulet which runs near the village extinguished the fires and stopped the machinery in the Wellington cotton-mill. The workmen were nearly drowned in making their escape, and six of them were carried away by the stream and drowned in attempting to cross a bridge near the premises. Portsmouth and the surrounding country was also visited by the storm of Thursday. For the space of 20 minutes the thunder was incessant; the rain and hail poured down at intervals in torrents, and in the neighbourhood of Sheet and Liss the hail-stones measured from 3 to 5 inches in circumference; and such was the quantity which fell, that although the temperature was high and the air sultry, whole cart-loads were lying on the ground even on the following morning. The roofs of the greenhouses were literally smashed, scarcely a frame being left unbroken. Some potatoes, which had been dug up in the morning, but left on the ground, in a field near Liss, were broken to pieces, and the fragments scattered in all directions. At Dover the storm occurred on Sunday, and was felt with equal violence to the eastward and westward; the thunder and lightning commenced about 8 o'clock, and lasted with little intermission till nearly 11, with deluges of rain at intervals; the lightning was of the most vivid description, and at least twelve flashes in a minute, and one crash of thunder led the inhabitants to suppose that the Keep and Battlements of Dover Castle had tumbled down. At Canterbury, Brighton, and other places in the southern districts, the storm was equally severe, and most destructive in its effects. About 9 o'clock, during the storm, a ball of fire fell on the buildings of a farm, called Guston, in the parish of Ash, next Sandwich, the property of Mr. Coleman; and although the engines from Sandwich and Canterbury were sent for, they arrived too late to save any of the property, except the farm-house, which was detached from the buildings. Two barns filled with corn, a bean-stack, and all the out-buildings were entirely destroyed, with some valuable cattle. A woman who witnessed the storm saw a ball of fire fall on the barn. At Brighton it occurred during the evening service, numbers fainted away with fright, and the scene altogether was most appalling.

Bedford.—During the past week a painful degree of alarm has been created in some parts of Bedfordshire by the revival of those incendiary outrages which spread dismay throughout the district last winter. In addition to a destructive fire at Dunstable on Wednesday week, four others are reported to have occurred under circumstances which admit of little doubt that some if not all are attributable to design. The most destructive of these fires have taken place at a farm in the occupation of Mr. Pope, of Lower Caldicott, on the premises of Giles Smith, a gardener, near Biggleswade, and at Toddington. Some of the principal landowners in the county have recently evinced a disposition to adopt any tangible scheme that may be suggested with a view to better the condition of the agricultural labourers, of whom there are at present a very considerable number only partially employed, and there is no doubt whatever that the incumbrance will be immensely increased by the cessation of field-labour, as the harvest has in many places been nearly got in. Amongst others, Lord St. John has announced his intention of introducing on his estate the plan of fork or spade husbandry, recommended by the Highland and Agricultural Society. His Lordship says "I have already broken up some land with the fork, and am so satisfied with the advantages of the plan that I intend forking the whole of the land for fallow crop next year, which will most likely be the double one of turnips and beans, a system I have adopted for two or three years past."

Buckingham.—The majority of the Marquis of Chandos, eldest son of the Duke of Buckingham, was celebrated at Stowe on Tuesday with almost regal honours. The Lord Chancellor and Lady Lyndhurst, Lord and Lady Braybrooke, the Earl and Countess of Orkney, Lord and Lady Leigh, and a large number of distinguished guests, were present on the occasion, and no less than from 14,000 to 15,000 persons from all parts of the county assembled in the grounds to share his Grace's hospitality. The mayor and corporation of Buckingham went in procession to Stowe to present addresses to the Duke and Duchess, and to the Marquis of Chandos, and the festivities of the day were closed by dances in the tents and by a fine display of fireworks. It is impossible within our limits to give an outline of the arrangements, but the day seems to have been regarded as a general holiday throughout the greater part of the county. The rejoicings were continued on Wednesday with equal interest: all business was suspended in Buckingham, and the park at Stowe was crowded with farmers, agricultural labourers, and others, who took part in the numerous games which were arranged for their amusement. In the evening the Duchess gave a fancy ball, at which about 600 persons were present. On Thursday the Duke gave a dinner to his tenantry in the "Tenant's Hall," where about 300 sat down, his Grace presiding. In the evening there was a ball for their families and friends, the great pavilion having been granted for the special purpose. Yesterday there was a holiday among the servants on the establishment, which concluded the festivities at Stowe. On Monday the noble Duke and family remove to Wotton, where a renewal of the same, and another hospitable course of entertainment will be commenced.

Deal.—Capt. Bullock, R.N., has been occupied during the late spring tides in planting Mr. Jas. Steward's "ponderous-footed beacon" on the Goodwin Sands, under the immediate superintendence of the inventor; but as it could not immediately take root, it fell the next day. It was then raised from the horizontal to the vertical position, secured with chains, shrouds, and anchors, and again left in its proper position. On planting the beacon, it was found impossible to make an excavation in the sand sufficiently deep to cover its ponderous foot; all, therefore, that could be done was to set it up in a hole of the depth of about three feet, and secure it temporarily by stays to four anchors, until next spring tides, in the hope that through its own great weight, and the oscillation it would receive, in an upright position, by the action of the sea on its shaft and stays, it would gradually bury its ponderous foot in the sand—an operation which is said to be satisfactorily proceeding.

Dover.—During the storm on Sunday night, the police were sent for to quell a serious disturbance which had occurred in Paper-alley, Charlton. On their arrival they found the neighbourhood in the utmost alarm, expecting for hours previously that murder would ensue. The house was occupied by sweeps and prizefighters. The police were immediately attacked by the gang, and being only two in number, one of them was soon knocked down, and upon the other, named Couchman, coming to his assistance, he was immediately surrounded and stamped upon. At length one of the ruffians, named Clarke, a prizefighter, from Canterbury, took up the handle of a broom, to which a piece of iron was attached at the end, and struck Crouchman with great fury across the bridge of the nose, which lacerated it and the cheeks in a frightful manner. He never spoke afterwards, and having breathed for a short time, fell dead. Four of the gang concerned in the attack have been taken, but the leader, Clarke, and another, fled, and were seen on the road between Canterbury and Dover. A coroner's inquest has been held on the body, and a verdict of wilful murder returned.

Ipswich.—The formal investigation relative to the suicides of two of Earl Stradbroke's gamekeepers has terminated without affording any authentic explanation of the motives which induced either of the deceased persons to resort to self-destruction. The affair, therefore, remains involved in mystery, although report still attributes the death of both of them to their anxiety and dread of meeting their master, fearing his anger that such extensive depredations should have been allowed among his preserves as have lately thinned the number of his pheasants. The jury in the first case returned a verdict of "insanity," and in the other they found that deceased died from a gun-shot wound, but whether from accident or by his own hand, there was not sufficient evidence to show. It is reported that another of the gamekeepers has since these disastrous occurrences been placed under restraint, owing to the excitement which they have created in his mind. It is said that it is not long since another gamekeeper of Lord Stradbroke was murdered by poachers, and that several transportations beyond the seas were the consequence.

Liverpool.—On Tuesday morning shortly after two o'clock, the Dublin mail iron steam-ship Iron Duke (600 tons burthen) came into collision with the brig Parana (200 tons), outward bound from this port for Montreal, about three leagues to the eastward of Point Lynas Light, by which the latter vessel was nearly cut in two; and so sudden was the accident that six of her crew, including her commander, were drowned. The mate and four seamen were saved by clinging to the steamer. The brig had lights on her poop, but they were not seen by the steamer, as the night was very thick.

Manchester.—The following gratifying letter has been received by the honorary secretaries of the committee for forming public parks in this town:—"Whitehall, Sept. 7th.—Gentlemen, Although I have no longer any personal connexion with the town of Manchester, by property or other local tie, yet, considering Manchester to be the metropolis of a district, to the industry of which I and my family are under very deep obligations, and most heartily approving of the wise and benevolent design to provide for those who are doomed to almost incessant toil the means of healthful recreation and harmless enjoyment, I willingly contribute to the furtherance of that design, and offer my cordial wishes for its success. I request my name may be added to the subscription which has been commenced for this purpose, for the sum of 1000*l.* I am, Gentlemen, your obedient servant, ROBERT PEEL.—(To Malcolm Ross, and Edward Watkin, Esqrs.)" A meeting of the committee on public parks was held on Monday, when a resolution was unanimously adopted, expressive of their high appreciation of the opinions expressed by Sir Robert Peel, and conveying to him their sincere thanks for his munificent gift and for the gratifying terms in which he had communicated it.

Portsmouth.—It is stated that as the differences lately on the eve of causing a rupture between this country and France are amicably adjusted, it is the intention of our Naval Administration, in order that they may not be caught in so inefficient a predicament on any future occasion, quietly to increase our naval strength by commissioning six or eight sail-of-the-line and a few 50-gun frigates. Among the ships to be commissioned will be the Neptune for the flag at Portsmouth, the Pembroke for the flag on the West India station; the Nile, London, St. George, Superb, Goliah, and Powerful. As there have been many misstatements on the subject, we subjoin a list of the advanced ships at the principal ports: Portsmouth—Neptune, 120; Britannia, 120; Princess Charlotte, 104; Rodney, 92; Powerful, 84; Vengeance, 84; Bellerophon, 78; Hastings, 72; Pembroke, 72; President, 50. Plymouth—St. George, 120; Royal Adelaide, 104; Nile, 92; Clarence, 84; Bombay, 84; Calcutta, 84; Vanguard, 80; Superb, 80; Foudroyant, 78; Indus, 78; Implacable, 72; Endymion, 44; Melampus, 42. Sheerness—Howe, 120; Waterloo, 120; Trafalgar, 120; London, 90; Monarch, 84; Ganges, 84; Asia, 84; Achille, 76; Hercules, 72; Hawke, 72; Russell, 72; Boscawen, 70; Cornwall, 50; Chichester, 50; Worcester, 50; Conquestador, 50. The commissions for the brigs forming the experimental squadron arrived on Saturday morning, and also the commission for that fine steam-frigate the Firebrand. The Collingwood, 84, with the flag of Rear-Admiral Sir G. Seymour, received her sailing orders on Friday, and proceeded on Saturday afternoon to the Pacific.

Southampton.—The Monarch steam-vessel, which arrived here from Havre on Thursday week, brought over an exceedingly handsome *char-à-banc*, similar to those used by the Royal Family during the Queen's visit last year to the Chateau d'Eu. It appears that, in the course of the numerous excursions made by King Louis-Philippe and his Royal guests in the neighbourhood of Eu, the Queen often expressed her admiration of those commodious and social vehicles, and the King, immediately on his return to Paris, ordered this one to be constructed as a present to Her Majesty. The *char-à banc* was landed at the pier, and immediately left for Windsor, drawn by post horses, the vehicle being too high to be conveyed by railway, as, when placed upon a truck, it would not go under the arches and tunnels.

Stockport.—Mr. J. K. Winterbottom, formely the most eminent solicitor in this town, and who, about four years ago absconded, charged at that time with various offences, was brought before the magistrates on Friday. A reward of 200*l.* was offered for his apprehension in August, 1840, but up to this period he had escaped, having, it is believed, been absent from England. His wife and family have been residing in Liverpool; and it appears that a desire to revisit them has caused his return to this country, and led to his detection. He was captured on the 5th inst., and brought over to Stockport next morning. The proceedings were merely of a formal nature; and he was remanded for a week in order to give time for the evidence against him to be prepared. The reward for his apprehension was offered by Messrs. Bush and Mullins, on behalf of one of the London insurance offices, whom he had defrauded, by using the signature of one of his clients; and it is expected that the charges against him will be numerous as well as important.

Torquay.—On Tuesday morning a very large shark was captured here at the entrance of the bay. Some fishermen who were taking up their herring nets observed a huge fish caught and making desperate struggles to get free. They proceeded cautiously to draw in the net, and had the satisfaction of securing it without materially injuring their net. He was held down in the boat, where he died, after some very strong throes. The men sold him for 1*l.* to a boatman, who is now exhibiting him from house to house; his appearance has excited much wonder, not unmixed with alarm, at the fact of his being found so near the town. He measures rather more than eight feet in length, and 2½ from point to point of the tail, and is furnished with five openings on each side of the gills. His upper jaw extends eight inches beyond the lower, and both jaws are furnished with a triple row of most formidable teeth, each row turned in a direction different from the others.

Windsor.—An accident occurred in the Waterloo-gallery on Thursday week, which, had it unfortunately

taken place during the evening of Friday, at the time the apartment was crowded with Her Majesty's guests, might have been attended with the most serious results. One of the five massive chandeliers fell on the floor with a loud crash, and was broken into a thousand pieces. Of the several circles of cut plate glass, upon which were emblazoned the star, garter, and motto of the Order of the Garter, not one escaped. None of the workmen who were in the room at the time were beneath, or they must have been crushed to death, the chandelier, it is stated, weighing upwards of seven hundred weight. These chandeliers are of or-molu, and of exquisite workmanship, and are suspended from the ceiling at about fifteen feet from the floor. They cost, it is said, from 2000*l.* to 3000*l.* each, and are considered to be the most rich and beautiful specimens in this country.—The state apartments have this week been again re-opened to the public. As a large portion of these rooms will be required for the use of the King of the French upon the arrival of His Majesty in this country, in the early part of next month, the carpets and furniture placed in them on the occasion of the christening of Prince Alfred will not be removed. The rooms will continue open to the public until within a few days of the arrival of the King of the French.—Game of every description was never known to be so plentiful as it is this season on the Royal preserves at Swinley, the Norfolk and Flemish Farms, in the Home and Great Parks, and at Rapley Farm. Some idea may be formed of the immense number of pheasants now on the preserves, when it is stated that not less than 2250 pheasants were reared by hand, having been hatched by barn-door fowls, in the spring, at the several farms belonging to the Queen and Prince Albert, independently of the large number which were bred wild.

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 3072*l.*; Bristol and Gloucester, 1122*l.*; Eastern Counties, 4708*l.*; Edinburgh and Glasgow, 2840*l.*; Great Western, 18,263*l.*; Grand Junction, 9166*l.*; Glasgow, Paisley, and Ayr, 1702*l.*; Great North of England, 2228*l.*; London and Birmingham, 18,026*l.*; South Western, 8563*l.*; Blackwall, 1537*l.*; Greenwich, 906*l.*; Brighton, 6477*l.*; Croydon, 695*l.*; Manchester, Leeds, and Hull associated, 8696*l.*; Midland, 10,702*l.*; Manchester and Birmingham, 3358*l.*; Newcastle and Carlisle, 1906*l.*; Newcastle and Darlington, 1049*l.*; Preston and Wyre, 652*l.*; South-Eastern and Dover, 7004*l.*; Sheffield and Manchester, 782*l.*; York and North Midland, with Leeds and Selby, 3259*l.*—The Railway Department of the Board of Trade have given notice, that it is their intention to examine into the following schemes, in addition to those mentioned in a former paper:—1. The scheme proposed for extending railway communication through South Wales to Pembroke and Fishguard. 2. The Trent-valley scheme, from Stafford to Rugby. 3. The Churnet-valley scheme, from Macclesfield to Derby and Tamworth. 4. The proposed branches of the Grand Junction Company to connect Shrewsbury, Dudley, and the Potteries with their line, and to shorten the distance to Liverpool by means of a new line across the Mersey, leaving the Grand Junction line near Preston-brook. 5. The Leeds and Thirsk scheme, and, in connexion with it, other schemes proposed for connecting Harrogate and Knaresborough with the Great North of England or York and North Midland. 6. The Lancashire and Yorkshire Junction scheme, from Blackburn, by Burnley, Skipton, and Keighley, to Leeds and Bradford, and, in connexion with it, the Blackburn, Burnley, and Accrington, Leeds and Bradford extension, and other schemes for accommodating portions of the same district. 7. The Scottish central and other schemes, for extending railway communication north of the Forth to Stirling, Perth, Dundee, and Aberdeen. 8. The Lynn and Ely scheme. 9. The Belfast and Ballymena scheme. 10. The Liverpool, Ormskirk, and Preston scheme.—At the Manchester and Birmingham meeting last week the balance of profits applicable to dividends this year was 34,000*l.*, of which 30,000*l.* are appropriated to a payment of 1*l.* per share, or 5 per cent. The increase of receipts on the half-year is 2700*l.*, and a further augmentation of traffic is expected from the late arrangements made with the Birmingham and Gloucester and Bristol railways. The Macclesfield branch has been contracted for under most favourable circumstances, and the Trent-Valley line is to be immediately carried out. It was resolved to apply to Parliament for authority to make a junction with the Liverpool and Manchester railway, including a branch line to Altringham. Some arrangements with other companies were also completed.—At the Manchester and Leeds meeting last week it was stated that there had been a weekly increase on this year's traffic of 1450*l.*; and the dividend declared was at the rate of 7 per cent. per annum. An encouraging opinion was expressed of the Sheffield and Gainsborough and London and York direct lines.—The Croydon Company have declared a dividend of 5*s.* per share; the accounts show an increase in receipts of 2500*l.*, while in tollage there has been an increase of 1500*l.* payable by the Brighton Company, and an increase of 2300*l.* payable by the South-Eastern Company. The opposition raised by the South-Western Company to the Croydon and Epsom line has not damped the ardour of the Croydon shareholders, who have authorised their directors to join the Portsmouth Junction scheme, so as to connect it with Chatham, and thus increase the general traffic of the road. The atmospheric principle, it is understood, will be introduced on this line.—At the meeting of the West London Company it was stated that the directors are endeavouring to enter into arrangements with the Birmingham and Great Western boards, for the purpose of forwarding the interest of the company, and communications having already been made on the subject, it was deemed advisable to adjourn for a few weeks till the result of those negotiations are known. It was admitted that the line of itself would not attract traffic, but with the assistance of these great companies it seems to be considered that success will be attained. The question of some common London terminus for all the principal lines is now beginning to be much discussed, and if railway speculation continue in its present activity, it is supposed that it will at no distant day be supplied.—A meeting of the Dublin and Kingstown Company was held last week, for the purpose of issuing 30,000*l.* debentures at 4 per cent., to pay off the loan from the Commissioners of Public Works on account of the Dalkey branch, bearing interest at the rate of 5 per cent. It was stated that the receipts from the 1st March to the 27th August were 28,662*l.*, or 4000*l.* above the receipts of the same period last year. The revenue of the line steadily increases, and the Dalkey branch, which is remunerative, is regarded as an important feeder to the general line. It was suggested in the course of the proceedings to extend the Dalkey line to Bray, every confidence being expressed in the economical working and good order of the atmospheric principle.—At the Dublin and Drogheda meeting it was announced that the works of the line are in substantial and excellent condition, and that the railway will be completed throughout for 14,000*l.* per mile.—At the special meeting of the Greenwich Company on Tuesday it was resolved by a large majority to accede to the terms upon which the Greenwich line was to be surrendered to the South-Eastern Company. They proposed that a lease for 999 years of the Greenwich line, together with all works and conveyances connected therewith, should be granted to the South-Eastern Company at a rent of 36,000*l.* for the first year, and 1000*l.* per annum additional until it shall reach 45,000*l.* per annum, to include the land on each side of the railway reserved for widening the Greenwich line, but not other surplus land belonging to the company which might be taken at a valuation of 20,000*l.* for the whole or in parts in proportion. The engines, carriages, stores, and working plant to be taken at a valuation in the usual way. The lease to commence from the 1st January, 1845, subject to the ratification of the shareholders of both companies, and the sanction of Parliament. A lengthened discussion took place respecting the propriety of acceding to these terms, on the ground that new railways connected with the north of Kent were in contemplation, which, when connected with the Greenwich line, would yield greater returns than those proposed, but ultimately the terms were agreed to without modification.—The meeting of the London and Dover Company was held on the same day. From the report it appeared that the gross revenue of the South-Eastern railway and of Folkestone harbour for April, May, June, and July, was 81,482*l.* 9*d.*, to which had to be added a balance of 1223*l.* 10*s.* 10*d.* making in the whole 82,705*l.* 11*s.* 7*d.* The working expenses amounted to 40,994*l.* 6*d.*, leaving a net profit of 41,711*l.* 11*s.* 1*d.*, out of which a dividend was declared of 10*s.* 6*d.* on the paid-up shares, and 1*s.* 3¾*d.* on the last issue. The Directors stated that they had considered the expediency of carrying out at once many extensions of the South Eastern Railway, and had directed Mr. Stephenson to survey the country from London through Woolwich to Gravesend, Rochester, Chatham, Sittingbourne, Faversham, and Chilham, for a line uniting with that to Canterbury and Ramsgate, in the valley of the Stour; and from Rochester to Maidstone for a line uniting with the present Maidstone branch, and forming a communication across the counties of Kent and Sussex. A survey was also in progress by Mr. Cubitt, from the Ramsgate and Canterbury branch to Sandwich and Deal. They had taken steps for making, by consent of the landowners, a branch to Tunbridge Wells, which would be highly profitable, and capable of being advantageously extended from Tunbridge Wells to Hastings. They had also concluded an arrangement, under the power of the Canterbury Act, for a lease of the Whitstable Railway. The Maidstone branch to Paddock Wood will be opened within a month. The works of the Canterbury, Ramsgate, and Margate branch had been offered to public competition, and would be placed in the contractor's hands without delay. A careful examination of the country between Tunbridge Wells and Hastings had enabled the board to select a line which would reduce the distance between London and Hastings fourteen miles, as compared with the route by way of Brighton. The chairman announced that the Greenwich Company had agreed to lease their line to their Company on the terms already announced to the public, and a formal resolution, agreeing to the same, was carried by acclamation. The directors were authorised to take the necessary steps to secure the North Kent line to this company, and to apply to Parliament.—The *Railway Chronicle* states that the Dover excursion trains did not for the first two weeks meet with adequate success, but the directors persevered, and now their Saturday trains, returning up till Monday night, are crowded with passengers, who can thus spend part of Saturday, Sunday, and Monday in France, going and returning from London at a single fare. The number of excursion tickets issued for the six excursions, from the 27th July to the 1st September inclusive, was 45,532—being an average of 7000 each excursion. The last excursion consisted of 14,000 persons.—On Saturday last 31 carriages, containing 700 individuals, left the Vauxhall station of the South-Western Railway for Southampton and Gosport, completing the journey in four hours and twenty minutes to each place—six carriages leaving for Gosport at the Bishopstoke Junction, and 25 proceeding on to Southampton. The greater part proceeded to the Isle of Wight, being permitted to return to town by any train up to Tuesday night. In order also to afford the country people the same means of enjoyment, a similar trip was announced from Southampton to London, and on Monday morning 21 carriages, containing 530 persons, left Southampton, being joined by seven carriages more at Gosport. They were permitted to return by any train up to Thursday night.—The London and Blackwall Railway cost 326,670*l.* per mile, which is the highest cost of any railway in the kingdom. The Greenwich is the next, having cost 264,733*l.* The three lines which were executed at the lowest cost per mile are the Arbroath and Forfar, the Aylesbury Junction, and the Hayle Railways, which severally cost 9130*l.*, 8710*l.*, and 6940*l.* per mile. The London and Birmingham cost 53,780*l.* per mile; Great Western, 55,330*l.*; South Western, 27,750*l.*, Liverpool and Manchester, 41,320*l.*; Manchester and Leeds, 59,800*l.*; and the London and Brighton, 64,370*l.*

IRELAND.

Dublin.—The decision of the House of Lords, by which Mr. O'Connell and his fellow prisoners were set at liberty, was known in Dublin on Thursday afternoon. Immense crowds were assembled at Kingstown, awaiting the arrival of the packet from England, which entered the harbour shortly before 5 P.M. Mr. Ford, Mr. Cantwell, and Mr. Mahony, the agents of the traversers, appeared on board, bearing white flags, on which were inscribed, "Judgment Reversed by the House of Lords—O'Connell is free!" A tremendous cheer arose from the multitude, and the acclamations were renewed again and again whilst those gentlemen proceeded to the railway station, accompanied by great crowds. The news spread like wildfire, and cheering was heard in all directions. The streets all along the route were densely crowded, and in front of the prison an immense multitude were assembled. In a short time the crowd became so numerous that it was necessary to send for the Horse and Foot Police to preserve a passage. In less than half-an-hour after the arrival of the packet at Kingstown, Mr. O'Connell and his fellow prisoners were acquainted with the reversal of the judgment. Nothing could exceed the excitement which prevailed in all parts of the city. It was scarcely less on Friday, when the formalities were gone through preparatory to Mr. O'Connell's release, and he received his friends for the last time in prison. In the early part of the day a communication was made to the High Sheriff, by means of an official letter from Mr. Lucas, the under secretary of State, that he should hold himself in readiness to discharge the state prisoners as soon as the order of the House of Lords should arrive. Mr. Gartlan, one of the agents for the traversers, in the late prosecutions, who remained in London after the other agents, arrived in town on Friday evening with the order for their discharge. Immediately after his arrival he proceeded to the Richmond Bridewell and informed Mr. O'Connell and his fellow-prisoners that they were at liberty. This intelligence having spread rapidly through the neighbourhood, a considerable number of persons collected round the entrance door of the prison in order to see and welcome them upon their liberation, it having been generally understood that they would go to their respective homes for the night and return in the morning for the purpose of leaving the prison in triumph—passing along the same route by which they were conveyed there. Shortly after seven Mr. O'Connell left the Penitentiary leaning upon his sons, Messrs. John O'Connell, and Daniel O'Connell, jun., accompanied by Mr. Steele, and proceeded on foot, amidst the shouting of the mob, to Merrion-square, where he arrived about a quarter before eight. The other prisoners subsequently left the gaol, and were also loudly cheered upon making their appearance. A considerable assemblage collected about Mr. O'Connell's house, and in a few minutes after his entrance he addressed the people from his balcony, exhorting them to go gome peaceably and he would meet them in the morning. On Saturday Mr. O'Connell left his house at seven o'clock for the prison, where a procession was formed to escort him in triumph to his residence. The procession was headed by the trades of Dublin; it consisted of thousands of people, carriages and cars of all descriptions, including the Lord Mayor and corporation in their state coaches, several members of Parliament, and the personal friends or political admirers of Mr. O'Connell. It is said that altogether there were not less than 500,000 persons present. Mr. O'Connell wore a green velvet cap embroidered with gold. He rode in a triumphal chariot surrounded by a mob so dense that it was with great difficulty that the six dappled grays could force the cumbrous vehicle along, which every instant seemed about to become a second car of Juggernaut, and crush some of its adorers. On the top of the chariot were two large arm-chairs, covered with purple velvet and gilding, in which were placed Mr. O'Connell and his son John. The hon. gentleman stood up to his full height, and waved his velvet cap and bowed incessantly, whilst at intervals his lips were seen to move; but it is needless to say that whatever he said was utterly inaudible through the storm of cheers which raged around him. On the second step was seated the Rev. Dr. Miley, and on the lowest range sat Mr. D. O'Connell, jun., an Irish harper in full dress playing on an Irish harp, and two of Mr. O'Connell's grandsons, dressed in tunics of green velvet with caps of the same material and white feathers. Thus accompanied, Mr. O'Connell moved on through all the principal streets of Dublin, which were thronged to suffocation. Every

and with or available lamp-post was covered by people who shouted and cheered incessantly. Mr. O'Connell reached Merrion-square at half-past five, where he was received with several rounds of enthusiastic applause. Having ascended to the balcony, he proceeded to address that portion of the procession as occupied the space in front of his house. He began by saying that this was a great day for Ireland, and a day of justice. All the people of Ireland ever desired was justice, and they had now got an instalment of it. The plans of the wicked, and the conspiracy of the oppressor, the foul mismanagement of the jury list, the base conspiracy against the lives, the liberties and the constitutional rights of the public, had all, blessed be God, been defeated. Justice had thus far been obtained, and Ireland might if she deserved it be free. From north to south, and east to west, they had met in myriads—heard the wrongs of Ireland described, knew that they were described without falsehood or exaggeration, knew that they had been a nation, and determined that they would be a nation again. Their Clontarf meeting had not taken place as yet, but it would be for the Repeal Association, who had the confidence of the Irish people, to determine whether it might not be necessary for the sake of public principle that that meeting should yet be held. He hoped they might conclude that it would not be necessary, but if the cause of liberty required it, they would all go there peaceably and unarmed, and return with an increased determination that Ireland should be a nation. His own opinion was that it would not be necessary to hold the Clontarf meeting, because he thought that the principle which would call for it had been abundantly vindicated already. Even the State Trials had vindicated it. Then if they did not take that step what were they to do? Why, everything that could be necessary to procure Repeal. They said he was guilty of a conspiracy! His answer was, they lied. It was not he alone who said that, it was Lord Chief Justice Denman of the House of Peers who said it. If he (Mr. O'Connell) had wished his vanity to be indulged, and to prove his skill as a lawyer, he could not have devised a plan better calculated to effect his object than the events which had occurred. He went on to say, that he should on Monday be at the Conciliation-hall, when he would put forth his plans for the future, especially a plan for holding county meetings, to petition for the impeachment of the judges, the Attorney-Gen., and others concerned in the late prosecution.

Mr. O'Connell, in the course of his address, forbade illuminations, or any mode of testifying exultation that might be taken as offensive by opponents, and in this particular his orders were very generally, if not universally complied with. Before his final departure from prison, he desired the governor to furnish him with a list of all the prisoners of good character confined there, whose imprisonment depended on fines, and gave orders to have them paid. The sum amounted, it is said, to nearly 70*l*. On Sunday morning Mr. O'Connell proceeded to Marlborough-street Chapel, accompanied by his son John, where a grand high mass, in thanksgiving for his liberation, was performed by Archbishop Murray, Roman Catholic Archbishop of Dublin, who had never before taken any part in the Repeal movement. The Lord Mayor was present in state, and the building was crowded to suffocation. The sermon was delivered by the Rev. Dr. Miley, one of the most distinguished preachers of the city.

In the course of his address, he referred to that day as being a great festival in the Catholic church, that of "the Nativity of the Blessed Virgin:" coincident with its celebration this remarkable incident had occurred with Mr. O'Connell, and those members of his family, as well as of the other prisoners who were in communion with the Catholic church, viz., that when all hope from human aid had appeared to be vain—when all succour from man might well be despaired of—it had been suggested to them, by a pious Catholic clergyman, to pray to Heaven, through the intercession of the Blessed Virgin, for that justice which it seemed that man was determined to deny to them. The devotion was begun, and the last day upon which it was to terminate was completed, when Mr. O'Connell and the others were free, but not until then. It was to say the last prayers of thanksgiving—the last prayers appointed by the church—that Mr. O'Connell had returned to the prison, to pass from thence to the car of triumph. He did not call this a miracle; but it was an incident so far beyond human calculation, that one of the solicitors engaged in the cause had said to him, that though he had heard the judgment reversed, had seen men congratulate themselves on the event, and was himself the bearer of the official document, still he could not believe it to be true. The idea of having those peculiar prayers for the intercession of the Virgin was suggested to the mind of the priest who conducted the devotion by observing that Mr. O'Connell had, in the speech at Tara, noticed that the day was commemorative of "the Assumption," that he begged for the prayers of the Virgin to protect the cause in which he was engaged, that being one which had for its object an improvement in the condition of the helpless poor, and that used as its only means those that were free from crime of every description, whilst it inculcated respect for the law and loyalty to the Sovereign. The preacher then adverted to other events that were notorious in history, to show, as he said, the coincidence between prayers to the blessed Virgin and the fulfilment of them, contrary to all human probability.

Those portions of the sermon referring to Mr. O'Connell and the state of Ireland produced a great sensation in the church. The religious ceremonies were not terminated until two o'clock. At that time Mr. O'Connell left the church, and was accompanied by hundreds on his way home, all testifying by their cheers the delight they felt in seeing him once more restored to liberty. The same enthusiasm prevails in all parts of the country. In the towns and cities the event has been commemorated by illuminations and processions, while in the rural districts bonfires blazed on the mountains from one end of Ireland to the other. The entire island is one scene of excitement and rejoicing.

Repeal Association.—On Monday morning Conciliation-hall presented within and without such an appearance as it never yet exhibited since it was first opened, immediately after the suppression of the Clontarf meeting last year. Between eight and nine o'clock large crowds of persons, of whom the majority were well-dressed women, assembled around the doors, which after awhile were thrown open to the accumulating masses, and instantly the galleries and body of the hall were thronged by the densest assemblage ever witnessed within any building. Mr. O'Connell did not make his appearance until past 1, when he was received with a storm of cheers from every part of the hall, which was echoed by the vast crowds without who could not get admittance. For nearly ten minutes cheering and applause, which was not surpassed in intensity either at Tara or Mullaghmast, continued to peal through the hall. Mr. O'Connell acknowledged it by repeatedly bowing around him, kissing his hands to the ladies in the gallery, and placing the crown of his hat on his heart. As he was thus engaged, Mr. Smith O'Brien rushed to the front of the platform, causing if possible an increase in the clamour, and seizing Mr. O'Connell's hand shook it vigorously for some moments. Mr. O'Connell then caught Mr. O'Brien's hand, and placed it on his heart, whereat the very building trembled beneath the cheering and stamping. At last Mr. O'Connell seemed to get tired. He opened his lips again and again to speak, but his words were inaudible until a number of uplifted hands and voices from the platform stilled the storm. Mr. O'Connell was at length heard to say that he claimed it as a privilege to be allowed to move that the Right Hon. the Lord Mayor of Dublin do take the chair. The Lord Mayor then took the chair, and after a brief speech from his Lordship, Mr. Ray came forward with the minute book of the Association, and said he had the greatest delight in resuming the honourable office of Secretary for Ireland. On the motion of Mr. O'Connell, Mr. Somerset Butler, M.P. for Kilkenny, was admitted a Member of the Association; on the motion of Mr. S. O'Brien the Hon. Geo. Hely Hutchinson, brother of Lord Donoughmore, and a Protestant, was admitted a member; and on the motion of Mr. Grattan, M.P., Capt. Mockler, of Meath, an Orangeman, was admitted.

Mr. O'CONNELL having risen to hand in some money, proceeded to say—"As I am upon my legs, I believe I may as well proceed at once to address you. It would be utterly impossible for me to find language adequate to describe the sensations of delight with which I once again address this assembly. I had imagined that my voice was to have been suspended at least until the month of May next, but the 'merry month of May' has come upon us eight months too soon, and we can now rejoice as merry as May birds. But, seriously speaking, we have the most important reasons for rejoicing. A victory was never yet more worthily won—a triumph was never yet more honestly earned. We have had a triumph over combination and foul conspiracy—we have had a triumph over the crime of packing of juries—we have had a triumph of the constitution, and we are therefore entitled to enjoy the pleasure and satisfaction of that triumph. I am, as I have stated, utterly unable to describe the sensations that overpower my mind. The first thing that comes upon me with all the force of an absolute certainty is, that repeal must be carried—that nothing can impede repeal but misconduct on our parts—that recent events prove that repeal is in its progress too awful and important to be retarded by any means but our own misconduct alone. It is not by man's effort that we have achieved this victory over fraud, and conspiracy, and injustice. It is not by man's means that so great a change has taken place in one week. The judges refused everything that we demanded for conducting our defence. Every motion that was made on our part was sure to be negatived by the bench. Every attempt that we made for our defence was counteracted by the judges. Every right given to us to insure an acquittal was taken away by the selected jury. We appealed to the House of Lords, but even there we found the same unfavourable auspices. We found seven out of the nine English judges giving the most astoundingly absurd opinions that ever were pronounced by mortal man; but they were not the less against us for being absurd. Yes, I repeat it is not the work of man. It is a blessing bestowed by Providence on the faithful people of Ireland. There is no superstition in representing it as the gift of Providence; no submission in bowing before the throne of God and accepting it as His act. I would not introduce such a topic here if it were contrary to the principles or doctrine of any religious sect represented here. But it is not. It is the doctrine of the Protestant Church, as well as of the Catholic Church, that God interferes with the concerns of man. As Christians they all believe that; and the Book of Common Prayer contains, in every part, proofs that it is one of the tenets of Protestantism, for it contains prayers for heat in time of rain, and for other variations in the seasons, as well as for every temporal advantage. I cannot, therefore, hurt an individual prejudice by referring to this subject; and I would not do so, if it were possible that any such prejudice could exist. What I have been describing is clearly the doctrine of the Catholic Church also. And let us recollect that millions of the faithful people of Ireland had lifted up their hands to God—that the priests of God offered up the holy sacrifice of the mass—that the holy secluded Sisters of Charity united their prayers with those of the priests at the altars. The Catholics of England joined with us on the occasion. The entire Catholic population of Belgium offered up similar prayers, and along the shores of the Rhine, the same voice of supplication has been heard. Oh yes, it has been heard, and we stand free before you, thankful to God, and blessing all good men. It is a glorious triumph, and it is fitting that such a cause should have had such a triumph." What were they prosecuted for? Why, for holding the most orderly and peaceful meetings, to exercise the right of petition, when it might be truly said that the voice of the people was the voice of God. He trusted that the Minister who had advised this proceeding would be impeached. They were now triumphant over those who had thought to overturn the trial by jury. They had saved that important tribunal to the constitution. They would this day also proclaim that Repeal was absolutely necessary to Ireland. They would persevere in seeking it constitutionally. They would break down the table of the House of Commons with petitions, and in every way they would preserve and exercise their lawful and peaceable organisation. The 6th and 7th counts were for holding meetings to intimidate. Those counts were declared to be good by every one of the Judges here—even by Judge Perrin. Judgment was pronounced upon them, declaring that they contained criminal matter. The Judges of England were of opinion that they were bad. There was no difference of opinion among them, yet it was sought to punish him and others for the offence laid in those counts. The seven Judges of England—those wiseacres in law—said some of the counts were good and some bad, but they would presume that the Irish Judges did not give judgment on the bad counts. Why, their judgment was published—everybody could read them, and had been reading them—it was publicly announced that the Irish Judges had passed sentence especially on those counts. It was, in point of fact, as clear as the sun at noon day that judgment had been passed on the bad counts. The decision of the Judges in England was therefore founded on a lie. They called it a presumption of law, but he would call it a lie. Lord Lyndhurst affirmed that judgment, and that indescribable wretch, Brougham, did the same. He voted that the lie should be true in contradiction of the fact set forth on the record. The record told the truth. Brougham said it lied, in order to punish the defendants. Then, blessed be Heaven, three men were honest enough to attend to the truth, and not mind the lie. They looked to the fact, and did not mind the presumption. The fact was with the appellants, justice was with them: the truth was with them, and they would make the Government a compliment of the lie for their position. He was going to make atonement to men whom he had often assailed. He then contrasted Whiggery with Toryism, and insisted that Whiggery was infinitely preferable. He should not have been blamed for supporting the Whigs. He compared Brady with Pennefather, and the Judges and other official persons promoted by the Whigs with those advanced by the Tories, and said if the Whigs had been in power there would have been no monster trial. He then spoke of the Court of Justice of England. He had pronounced that trial by jury, as managed by the Tories, was a "delusion, a mockery, and a snare." Mark that, Mr. Attorney-General Smith; write that down Mr. Justice Crampton, and use it as a mark in your prayer-book. He next praised Lords Campbell and Cottenham, and said it would be a long time till he should again say a word against the Whigs. He would now advert to the future. How should they now carry on their operations? They would proceed as they had heretofore done, in a spirit of conciliation. He had more power this moment than any monarch in Europe. How did he acquire it? By abstaining from every sort of crime. He certainly never would have obtained it without the Catholic clergy. They and he were the apostles of a revolution without blood—of changes without doing injury or injustice to any man. Did not Dr. Murray yesterday offer up his thanksgivings for their release, and thus give his sanction to the proceedings, and attest that their conduct was moral and pure? He next adverted to the Clontarf proclamation, and then discussed the question whether they should again essay a meeting at Clontarf. He did not himself think it was necessary; but he would refer it to a committee to determine. The next thing he wished to bring forward was a project which had been in his mind last year, but he had not brought it forward, as it had not been completely matured. He meant the collection of a Preservative Assembly in Ireland. This subject was surrounded with legal difficulties which must be approached by degrees. They had been prevented from considering it by the proclamation and the subsequent proceedings. He was of opinion that three hundred gentlemen should meet in Dublin, and that the title to meet should consist in each gentleman handing in 100*l*. They should appoint a treasurer for themselves, and be the sole guardians of their money; but it was necessary that each gentleman should hand in 100*l*. to show that they had an interest in the cause. He proposed that they should initiate nothing, but correct and control everything. That the Repeal Association should take no step without the sanction and confirmation of these gentlemen, who would point out what they thought the most useful method for proceeding for repeal. A body of that kind would combine so many of the wealthy in Ireland, that it would form a drag upon the wheel, and prevent revolutionary violence. Those gentlemen would be of that bearing and station in society that they could enter into treaty with Government—arrange their own plans with Ministers, and stipulate terms. "And here let me say that I quite agree in making the experiment of a federal Parliament. I want any Parliament which will protect Ireland, and ask for no more. If we arrive at the period of repeal without some body of this description, Government may dictate a plan to you, perhaps, which may fall short of justice, though it satisfy some of you. They can never do so with this Preservative Society of 300." As there might be legal difficulties in the way of the formation of such a body, he should name this day week for a committee to inquire into the propriety of forming this body, to draw out the plan, and lay it before the most eminent lawyers in England and Ireland, that there may be nothing illegal in it. Three hundred wealthy merchants and country gentlemen of Ireland would prove a most influential body in procuring the repeal of the Union. He then said—"I have addressed you long—but I owed you three months' rent—and, like an honest man, I am paying my debts. And now I come to my third plan, and it is one to which I am greatly attached. I want to procure impeachments of the Judges of the Court of Queen's Bench and of Her Majesty's Attorney-General in this country; on these grounds—(great applause for some moments,)—on these grounds, I repeat, which I shall set before you, as briefly as I can, consistently with clearness. The first ground is that of the monster indictment which was preferred against me—36 yards of an indictment! (Cheers and laughter.) Lord Denman has well described it as a document calculated to prevent a man from defending himself. Such an indictment no poor man could escape from. We were backed by the repeal rent, but if such an indictment were preferred against a poor man, where could he get a brief of it for his counsel? Why, it would cost him 10 times more money than ever he saw, to do so. My excellent friend Richard O'Gorman (the dissentient grand juror) ought to be a proud man this day. He alone was right as to this unjust indictment, and had the manliness and honesty to maintain his opinions in open court. He said, 'We have spent five days over this bill, and not one of us can understand it.' To be sure they did not care much for that. They found it a true bill. I am much obliged to them. (Cheers and laughter.) Now, this is a idle act of the Attorney-General. Sugden planned it—Peel has adopted it. Impeachment, I say, then is our only remedy. (Loud cheers.) No man is safe from such a monster indictment. What ought the Court to have done with it? I say an honest Court should have quashed it again and again, if necessary, and have said to the Attorney-General in the words of Lord Denman, 'Pick out your counts, and do not suffocate them beneath the number of your accusations.' (Cheers.) The Judges of the Court of Queen's Bench did not refuse to receive it; nay, more, they countenanced it; and, proceeding as they commenced, refused us copies of the witnesses' names, the caption of the indictment, and other privileges which we should have received as a matter of course in England. By their conduct they made this monster indictment a babe of their own luck, and I say there is no use whatever in the doctrine of impeachments if we have not the Judges of the Queen's Bench brought before a proper tribunal to answer for their conduct. (Cheers.) I assert this, and I shall be able to prove it by competent witnesses, that the Lord Chief Justice (groans) had the air of a counsel for the prosecution throughout the trials, and might have been taken for such but for the place he occupied. It may be said I am rash in taking this up. Ah! I do not fear their prisons. (Tremendous cheering.) I am a freeborn British subject, standing on this place defending my rights, and I do accuse those men of injustice. (Renewed applause.) I am here to call upon the people of England to aid me in impeaching those men. (Cheering.) I have to complain too of their manner towards me. Mr. Justice Crampton used to squeeze up his face at me, as if to strike me with terror at his lion aspect. (Roars of laughter.) Now, I ask you all, did it ever occur at any trial before this, that the Chief Justice borrowed the Attorney-General's brief to make out his case and charge from? (Cries of "No," and groans.) You saw him do so? (Loud cries of "We did," and groaning.) Now, I do say that this is a fact which must and shall be heard. (Cheers.) I care not—not I—to the authority of the Lord Chief Justice. (Loud cheers.) I call upon the English people to join with me and Ireland, and drag him before a proper tribunal and ascertain whether such conduct as this is to be tolerated. (Loud cheers.) My next ground of impeachment against him in particular is his factious, his indecent charge. (Cheers.) It was one-sided and unjust. In the House of Lords, in the House of Commons, no one could be found hardy enough to defend it. (Cheers.) It was impeached by all, and admitted to be indecent. It was impeached by all, and admitted to be indecent. (Cheers.) I want to know, does it not deserve impeachment? (Cheers.) Who is safe from such a charge? We have no remedy against the injustice of such a charge, for it was not upon the record, and so we were deprived of the advantage of its influencing my appeal. (Cheers.) There is no other redress or remedy for this wrong but impeachment." He had been three months in gaol, but had the pleasantest companions in the world. For the imprisonment he did not care, so far as he was himself concerned, but he insisted, nevertheless, in having satisfaction for an unjust imprisonment. The Attorney-General had no right

to punish persons on the bare chance of their being guilty. He could have avoided this. He (Mr. O'Connell) proposed that a committee be formed to go to the different towns in England and state their case, and procure their assistance to impeach the Attorney-General. He should go, if the Repeal Association consented, from town to town to let the people see him, if it were only to gratify their curiosity by letting them see the lion that was encaged. But should the Ministry escape? Sir James Graham, the foul-mouthed letter-breaker, had the impudence to call the defendants conspirators. "He is a liar.") Sir Robert Peel had the impudence to say that the defendants had a fair trial. ("He is a liar.") He was a liar. That foul falsehood identified Sir R. Peel with the entire of the proceedings in the prosecution, and he would hereafter have the finger of scorn pointed at him as the monster liar of Parliament. How his (Mr. O'Connell's) heart throbbed at the prospects of success before him! What fun they should have round the statue of William III. in College Green when Repeal was obtained. After drawing a flattering picture of the future prosperity of Ireland when their Parliament was restored, the Liberator concluded by giving a hurrah for Repeal.

The scene of unrestrained joy that followed this speech baffles all attempts at description. Mr. John O'Connell, Mr. Steele, Mr. S. O'Brien, Mr. Barrett, and Dr. Gray then addressed the meeting; and Mr. O'Connell announced the rent for the week to be 575*l.* 6*s.* 6*d.*

Miscellaneous.

British Archæological Association.—This new Association assembled at Canterbury on Monday, under the presidency of Lord Albert Conyngham. His lordship, the leading clergy of the cathedral, the mayor and corporation, and the principal families in the neighbourhood, have taken a zealous part in providing for the meeting, by every needful preparation. The announcement made a strong sensation throughout the county of Kent, and members and their ladies have come from its outmost bounds to enjoy the scene. At the General Meeting on Monday, Lord A. Conyngham, on taking the chair, said that the city of Canterbury had been selected for the first annual meeting of the Association, because it offered peculiar attractions to every department of the Society. To the historical and mediæval sections more particularly, it presented a vast fund in the later Saxon remains with which it abounded, and in the historical events with which it was connected. It was here that we beheld the Ancient Britons keeping at bay the trained legions of Cæsar; that we saw the city taken by assault, and the Romans established in the country. Then followed the struggle with the Saxons, and the foundation of the kingdom of Kent; from this place also we beheld the spread of Christianity through the kingdom by the instrumentality of the Queens of two of the earliest Saxon Princes. The epoch of the Norman invasion also was memorable in this county, by the successful struggles of the men of Kent to preserve their privileges. The murder of Thomas A'Becket, in the cathedral of Canterbury, and the subsequent penance of Henry II., formed a marked feature in the history of the Church. There it was that the marriage of Edward I. was celebrated; and Edward the Black Prince, married to the Fair Maid of Kent, was interred within the cathedral walls. Within these walls also Cromwell stabled his troops. These, and other circumstances connected with the most important historical events of this country, rendered this city peculiarly fitting for the place of celebrating the first meeting of the Association. In the course of the day Sir W. Betham, Ulster King-at-Arms, read a paper on the origin of idolatry, and in the evening the Rev. J. B. Deane read a paper on barrows, introductory to an excursion for the purpose of examining the Saxon barrows at Breach Downs and Bourne. A paper by Mr. T. Bateman, jun., was next read, in which he described the formation and contents of many barrows he had opened near Bakewell, in Derbyshire. Sir W. Betham made some observations on the papers which had been read, more particularly with respect to the nature of cromlechs. There had been recently a discovery of them in Ireland, which left no doubt they were sepulchres, and not altars. He had recently noticed on the land of a farmer in the north of Ireland a number of these cromlechs, some of large size, which had not been exposed to view when he formerly visited the place. The farmer told him that he had uncovered them all, for the purpose of using the bones they contained for manure, which he had found within them in abundance. The Round Towers of Ireland, which have so long puzzled antiquarians, Sir W. Betham was of opinion were also sepulchral monuments. The recent examination of one at Ardmore, in Waterford, proved that it had been a tomb; for, after penetrating through two beds of concrete, a skeleton was found resting on another bed of concrete, under which was the natural rock. The artificial manner in which this body had been interred showed that the tower erected over it was intended for a sepulchral monument. At the close of this discussion a *conversazione* was held at the Assembly Rooms.—On Tuesday, notwithstanding the unpropitious nature of the day, the great majority of members availed themselves of an invitation from Lord Albert Conyngham to meet him at Breachdown, near Barham, about eight miles distant, where a few tumuli were opened for their inspection, after which the party adjourned to Bourne Park, where they sat down to a *dejeûner*, at which the mayor of Canterbury presided. The company next resumed the examination of the tumuli in the vicinity of the Park. As at the former place, they were proved to be places of sepulture, each containing some portion of human remains, many of which were very perfect, and contained relics of spear's heads, knives, and beads. The barrows at Bourne Park are of a low size, and from their shape and contents appear to be the graves of the earlier Saxon settlers in this district. In the evening there was a full meeting in the Town Hall, at which the discoveries in the course of the day's researches formed the principal subject of discussion. The Dean of Hereford presided. An urn and glass vase found in the barrow at Bourne Park, which were broken in their extraction, had been repaired in the course of the afternoon, and were placed on the table perfectly restored, together with the other remains found in all the barrows. The ornamental pattern round the urn showed it to be a Saxon one, and it is supposed to have belonged to the fifth or sixth century. A long discussion followed, in which Mr. Pettigrew, Professor Buckland, and other gentlemen took part.—On Wednesday the Mediœval section of the Association held their sitting, Archdeacon Burney in the chair. Several papers were read on Ecclesiastical Antiquities; and after a discussion, in which the Dean of Hereford and others took part, resolutions were passed with the view of preventing the destruction of antiquities at West Wickham, Llanthony Abbey, and other places. In the evening the Architectural Section held a full meeting, the chair being taken by the Rev. Professor Willis, of Cambridge. The first paper read was one by the President, on the Restoration of the Cathedral of Canterbury after the great fire, and containing notices of the course of its construction and history—interesting, however, only to the local antiquary. The Rev. Mr. Hartshorn read a paper on the Castles and Military Antiquities of Kent, and Mr. Godwin described some singular forms of masons' marks which appeared peculiar to certain places. In Canterbury Cathedral they were largely distributed. The proceedings of the day terminated in a *conversazione* at the Assembly Rooms. The ordinary took place at the Corn Exchange, in consequence of the large influx of members during the day. On Thursday morning an excursion was arranged to Richborough and to Balfreston Church, to inspect the antiquities, and most of the members were expected to attend.

Law.

COMMISSION OF LUNACY.—A commission *de lunatico inquirendo* was opened some days ago, in the board-room of St. Luke's workhouse, Chelsea, before Mr. Commissioner Barlow and fifteen special Jurors, of whom Captain Bague, R.N., was foreman, to inquire into the state of mind of Brent Spencer, Esq., aged 37, son of the late General Sir Brent Spencer, and now an inmate of the workhouse of St. Luke's, Chelsea. The Court was much crowded, in consequence of the interest the subject of this inquiry has excited by the examinations which have taken place in Queen-square, relative to the supposed ill-treatment by his mother, Mrs. Pelham, at whose house he was found confined to a single room, the particulars of which have already been before our readers. Mr. Commissioner Barlow said the jury had nothing to do with the matters which had appeared in the public prints, and which would come before another tribunal. The object was to ascertain whether Mr. Spencer was of unsound mind; and if so, to take the necessary control over his property. Several witnesses were examined, and the jury immediately came to the unanimous conclusion, "That Brent Spencer was of unsound mind, and had been so from the 3d of July, 1840." A woman here came forward and declared that Mrs. Pelham had kidnapped her child. Mrs. Pelham, who was present, looking much flushed, said, "Oh, no." The woman then declared that the younger son (Wilson Pelham) was kidnapped from her by Mrs. Pelham about 22 years since. She went on at considerable length to the same effect, and ultimately proceeded to Queen-square to make a formal complaint.

BIRTHS.—On the 1st inst., at Tissington-hall, Derbyshire, the lady of W. FITZHERBERT, Esq., of a son—2d inst., the lady of W. DUCKETT, Esq., of Russelstown Park, county of Carlow, of a daughter—4th inst., at Nether Seale-hall, Leicestershire, LADY GRESLEY, of a son.

DIED.—On the 3d inst., after a very long and painful illness, Sir R. EDEN, Bart., of Windlestone and Beamish Park, both in the county of Durham—3d inst., FRANCES WILLIS, wife of J. Willis, Esq., of Woodnesborough, Kent, aged 74—3d inst., at Hasland, near Chesterfield, ESTHER LUCAS, relict of B. Lucas, Esq., aged 79—5th inst., much respected, Mr. C. J. PAYNE, of 5, St. Martin's-court, Leicester-square, London—5th inst., R. KIRBY, Esq., of Cambridge-terrace, Hyde Park, and Cannon-street, in the City of London, and Gloucester, aged 69—7th inst., at Weavering, Kent, JEFFREY BARON DE RAIGERSFELD, Rear-Admiral of the Red, aged 74—8th inst., suddenly, at Englefield Lodge, Egham, Lieut.-Col. Sir J. WHATLEY, K.C.H., for 20 years Groom of the Bedchamber to their late Majesties George IV. and William IV., aged 80.

EXTIRPATION of all kinds of VERMIN.—Office, 69, King William-street, city, London.—Mr. J. A. MEYER, practical chymist, patronised by Her Majesty the Queen, H.R.H. the Duchess of Kent, the Royal Agricultural Society of England, and the Corporation of the City of London, and by special appointments to the principal Courts of Europe, begs to inform the nobility, gentry, merchants, agriculturists, shipowners, and the public generally, that he continues to CLEANSE, by contract, from one to five years, every description of PROPERTY, of rats, mice, moles, weasels, moths, fleas, bugs, &c., and as a guarantee of the efficacy of his preparation, respectfully refers to the certificates of his great success at Buckingham Palace and Gardens, Windsor Castle, St. James's Palace, Frogmore Lodge, Carlton Club House, Mansion House, Newgate Prison, Tavistock Hotel, Brewers, Chester, and Galley Quays and warehouses in Lower Thames-street, the property of Joseph Barber, Esq., and many others of public and private establishments, which may be seen at the office. The preparations, which are free of poison or deleterious drugs, may be had as above, in pots and bottles at 5*s.*, 10*s.*, 20*s.*, 50*s.*, and 100*s.* each, with full directions, which must be used in proportion to the extent of premises infested, to successfully eradicate the vermin, and which can be applied without injury to property. Dwelling-houses cleansed from 1*l.* to 5*l.* per annum; mansions and estates from 10*l.* and upwards; ships, docks, warehouses, granaries, breweries, farms, wharfs, &c., in proportion. Caution.—None are genuine unless bearing the signature and seal "Joseph Anton Meyer."

REAL SHEFFIELD PLATED DISH COVERS, at prices hitherto unattempted. THOMAS WEST, 18, Ludgate-street, London, having received a large supply direct from the manufactory at Sheffield, offers the best Meat Dish Covers as follow:—Cottage Pattern—1 Cover of 20 inches, 3*l.* 19*s.*; 1 do. of 18 inches, 3*l.* 3*s.*; 2 do. of 14 inches, 4*l.* 8*s.*; the set of 4, complete, 11*l.* 10*s.* ONLY. Double Dome Pattern—1 Cover of 20 in., 4*l.* 16*s.*; 1 do. of 18 inches, 3*l.* 19*s.*; 2 do. of 14 inches, 5*l.* 5*s.*; the set of 4, complete, 14*l.* ONLY. In noticing the prices of the above goods, T. W. ventures to assert they are superior to many advertised at a much higher price. Best Wrought Silver Spoons and Forks as usual, Fiddle Pattern, 7*s.* 2*d.* per oz.; Queen's Pattern, 7*s.* 4*d.* per oz. Superior Watches and Fine Gold Jewellery, cheaper than any house in London. West's Hand-book, with 100 engravings, and full of useful information, is just published, and may be had gratis, and post free, on application to T. WEST, Silversmith, 18, Ludgate-street, London.

DRESS AND FROCK COATS.—Superfine Cloth Dress Coats, 30*s.* to 35*s.*; Extra Quality, 40*s.* to 50*s.*; Frock Coats, with Silk facing, 35*s.* to 42*s.*, with Silk Velvet Collar and Silk facing, 50*s.*; Waterproof Chesterfield Coats, 5*s.* 6*d.* to 8*s.* 6*d.*; rich Satin, Silk and Cassimere, 8*s.* 6*d.* to 12*s.* 6*d.*; Trowsers, 6*s.* 6*d.* to 10*s.* 6*d.*; Doeskin and Kerseymere, 12*s.* 6*d.* to 21*s.*; Shooting Jackets, 15*s.* 6*d.*, Boys' and Youths' Cloth, Hussar Suits, 21*s.* to 30*s.* A Suit of Superfine Black Cloth, 3*l.*; Extra Quality, 3*l.* 10*s.* to 4*l.* At FISHER & CO.'s, Tailors, 31, King William-st., City, 10 doors from London-bridge.

SIX POUNDS OF TEA, whether Black or Green, for 17*s.*; and small bright Gunpowder, in 12-lb. canisters, 4*s.* 6*d.* per lb. East India Tea Company's Offices, 2, Great St. Helen's Churchyard, Bishopsgate-street.

HEALTH, LONG LIFE, AND HAPPINESS.—EXTRAORDINARY CURE OF SCORBUTIC HUMOUR.

I, WILLIAM WOOD, of Rockwell Green, in the parish of Wellington, Somerset, hereby certify, that for about seven years I was afflicted with SCORBUTIC HUMOUR on my nose, with a continued discharge, rendering me almost unfit for society. I tried several medical men, and various medicines for curing the same, but all proved of no avail, producing no beneficial effect; at last I was persuaded to try PARR'S PILLS, and after taking two small boxes and part of a third, I was completely cured, and I now feel no pain or inconvenience as before. Many parties in the neighbourhood, and your Agent for Wellington, Mr. GREEDY, can bear witness that my testimony is correct, and I wish it to be made known, that others similarly afflicted may be encouraged to try the same medicine, which under the blessing of God has proved so serviceable to me.

Witness my hand this 6th day of August, 1844. WM. WOOD.

In the presence of JOHN GREEDY, Wellington.

From Dr. C. STEANE, 184, Fulton-street, sole agent for Brooklyn.—An instance of the singular efficacy of PARR'S LIFE PILLS, which merits particular notice, occurred in the person of a lady, residing at Brooklyn, of consumptive make, who had been afflicted for upwards of six years with very great and general debility, headache, flatulence, faintings, and all the effects originating in an impaired constitution. Country air was tried, but to little advantage. She complained of weariness and pain on the least motion: her bowels were sometimes constipated, and at others lax, and never regular. At this period, she was recommended to try PARR'S LIFE PILLS, when no less astonishing than true, before she had finished two boxes, an entire and perfect cure was the result. To such, nothing can equal this antidote, as it imparts tone and strength to the stomach, and operates so mildly, that the most delicate of either sex can take them with the greatest safety.

To T. Roberts and Co., April, 1844. Yours truly, C. STEANE.

These, and hundreds of other cases of DECIDED CURES, attested on the highest authority, and already published, occupy upwards of 150 pages of letterpress. These Testimonials are published periodically, and may be had on application at any respectable medicine-vender's. The cures, in many instances, were effected after all other means had failed, and they thus establish the claims of PARR'S LIFE PILLS, in being considered the best medicine in the world.

CAUTION TO THE PUBLIC.—Beware of Spurious Imitations of the above medicine. None are genuine unless the words "PARR'S LIFE PILLS" are in WHITE Letters on a RED GROUND, engraved in the Government Stamp, pasted round each box. Sold by all respectable Medicine Venders.

WANT PLACES.—All Letters to be post-paid.

AS HEAD-GARDENER.—A Married Man, aged 33, who has had great experience in Forcing of Fruits, Flowers, and Vegetables; has had the entire management of a very extensive Flower-garden and Pleasure-grounds, and can have five years' unexceptionable character from the gentleman he is just leaving. No single-handed place will be accepted; no objection to superintend the management of a small quantity of Park or Meadow-land.—Direct to P. C., at Mr. T. Wild's, 3, Tavern-street, Ipswich, Suffolk.

AS GARDENER.—A Married Man aged 29, who perfectly understands his profession in all its various branches, including Pines, Vines, and Greenhouse plants; he is a native of North Britain, and can have a good character from the family he has lately left.—Direct to G. R., Westbourne-lodge, Harrow-road, near London.

AS GARDENER.—A Married Man without incumbrance, aged 30, who perfectly understands his profession in all its branches; his wife is an excellent Dairywoman, and their characters will bear the strictest investigation.—Direct to J. S., at the Hon. W. B. Baring's, Addiscombe, near Croydon.

AS GARDENER.—A Married Man, aged 36, who is fully competent to take the charge of a Nobleman or Gentleman's Gardens. Will be disengaged in about three weeks, and can have an unexceptionable character of seven years' standing. His wife would undertake the laundry if required. Direct, J. H., Messrs. Hedger's, 10, New Bond-street, London; or J. H., Burwood Lodge, Hersham, near Esher, Surrey.

AS GARDENER.—A respectable Married Man, without a family, age 40; his wife is a good servant. Can have an excellent character from his last place, and perfectly understands his business in all its branches. No objection to milk cows or make himself useful. Wages not so much an object as immediate employ. Direct A. B., Mrs. Hands, Montpelier Vale, Blackheath, Kent.

AS GARDENER, or GARDENER and BAILIFF.—A middle-aged married Man, who has a general knowledge of his business, having passed the whole of his life in the above capacity. Can bring with him good testimonials from his last situation; satisfactory reasons will be given for his leaving.—Direct to A. Z., Woodland-place, Highgate, Middlesex.

AS GARDENER.—An active, industrious, married Man, who is conversant with the thorough management of Hothouse and Greenhouse, Kitchen, Fruit, and Flower-Garden, and every branch of the business; and can have an undeniable character.—Direct to Messrs. WM. WOOD and Son, Nurserymen, Maresfield, near Uckfield, Sussex.

AS LAND-STEWARD or MANAGER.—A middle-aged married Man, who has for 12 years had the entire management of one of the largest farms in East Lothian, where he has had the most extensive experience in the breeding and feeding of Stock, and in the draining and cultivation of land, on the most approved principles. The most satisfactory references as to character and thorough practical ability can be given, to his present and late employers, and from several of the most eminent agriculturists in the South of Scotland. The advertiser will be at liberty from his present situation at Michaelmas next.—Direct to J. D., 151, Oxford-street, London.

FIVE POUNDS will be given by a Young Man for 12 months' practice in a garden where there are Pines and early forcing.—Direct A. B. C., Post-office, Christchurch, Hants.

TEN POUNDS will be given to any Nurseryman in Great Britain who can procure a situation for a Gardener in a first-rate family; he is a thoroughly practical gardener, single, aged 33, is well acquainted with the demands of a large establishment, and can supply them in every department; an unexceptionable character can be obtained from the family he is about to leave, which is one of distinction, as well as from former employers.—Direct to S. W. R., Mr. Thornawell, Grocer, Camberwell-grove, Camberwell, near London.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

A Stamped Newspaper of Rural Economy and General News.—The Horticultural Part Edited by Professor Lindley.

No. 38.—1844. SATURDAY, SEPTEMBER 21. [Price 6*d*.

OPEN TO ALL ENGLAND.

THE UXBRIDGE EXHIBITION for DAHLIAS, FRUIT, and FLOWERS, will take place on Monday, September 23, at the Uxbridge Nursery, where Cleopatra, the finest and most constant yellow Dahlia in existence, may be seen growing; it has been pronounced useful and fit for a stand of six by the best judges. The Stock will be divided into 20 shares, and let out dry at 10 guineas, if all the shares are subscribed for by the 20th of November; otherwise in plants at 10*s*. 6*d*. in May, 1845. (Dahlias in classes.) Blooms of the above Dahlia may be seen at Mr. Nutting's, 46, Cheapside.

J. KERNAN begs to announce the arrival of his large and carefully selected Dutch, Cape, and other Bulbs of every description.

Finest named Hyacinths, old favourites, from 6*s*., to 12*s*. and 18*s*. per dozen.

Double red mixtures, different shades, 3*s*. 0*d*. per dozen.
Double blue, 3*s*. 6*d*. per dozen.
Double white, 3*s*. 6*d*. per dozen.
Single, each colour, as above, 3*s*. 6*d*. per dozen.

Early Tulips, Narcissus, Jonquils, Anemones, Ranunculus, Iris, Ixias, Amaryllis, with all the new Lilies and good Herbaceous Plants, hardy and greenhouse, worth cultivating.

J. K. has also to offer, of this season's saving, some very choice seed—

From the finest named Calceolaria, 2*s*. 6*d*. per packet.
" " Cineraria, 2*s*. 6*d*. "
" " Heartsease, 2*s*. 6*d*. "
" " Geranium, 2*s*. 6*d*. "
Scarlet Phlox Drummondii, 6*d*. per packet.
Schizanthus Hookerii, 6*d*. "
Intermediate Stock, 6*d*. "

By sowing the above this autumn a season will be saved.

With many other good Biennials and Perennials. Also, Myatt's new Deptford Pine Strawberry; Myatt's British Queen do.; Prince Albert do., Lady's Finger do., Keen's Seedling do., Old Pine do., &c. &c.

Dulley's Scarlet Admirable Rhubarb, the very best for early forcing. Giant Asparagus and Sea-kale plants. Rivers's new Catalogue and Amateur's Rose Guide.

White Clover, Rape, Winter Tares, Rye, and Italian Rye-grass, for early green food. Catalogues may be had on application. All Mr. Rivers's Dwarf and Standard Roses may be ordered through J. K.

Curtis's and other new Budding and Pruning Knives.

4, Great Russell-street, Covent Garden, Sept. 1844.

J. T. WILLMER, King's Road, Chelsea, by Appointment Florist to Her Majesty, begs to inform his Friends and the Public that his Carnations and Picotees are now ready for sending out, catalogues of which may be had on prepaid application containing a postage stamp.

IMPORTED BULBS IN GREAT VARIETY.

WILLIAM CLARK, 25, Bishopsgate-street Within, London, respectfully informs his friends of the arrival of the above in very sound condition, and solicits early orders. Also may be had, strong plants of Princess Alice Maude Strawberry, Myatt's British Queen and Deptford Pine.

LILIUM LANCIFOLIUM. — Flowering Bulbs of these most beautiful LILIES to be had at the following low prices: Lancifolium album . . 5*s*. each.
" punctatum . 5*s*. "
" speciosum . 25*s*. "
of W. J. Nutting, Seedsman, 46, Cheapside, London.

Seed from the best varieties of IXIAS and SPARAXIS, at 2*s*.6*d*. per packet.

NEW CARNATIONS, PICOTEES, AND PINKS.

MESSRS. N. and B. NORMAN'S CATALOGUE of SHOW VARIETIES can be had on prepaid application.—Bull Fields, Woolwich.

BRACONDALE HORTICULTURAL ESTABLISHMENT.

JOHN BELL begs to inform his Friends and the Public, he has just received his Importation of DUTCH HYACINTHS AND OTHER BULBS, direct from Haarlem. Catalogues of which may be had at the Nursery, or his Seed Warehouse, 2, Exchange-street, Norwich.

MESSRS. MARNOCK & MANLEY beg to inform their friends and the public that they are now sending out their DUTCH BULBS, which have arrived in exceeding fine condition. Catalogues may be had on application.

Nursery, Hackney, Sept. 19, 1844.

CARNATIONS, PICOTEES, PINKS, AURICULAS, ALPINES, AND POLYANTHUS.

Great Yarmouth Nursery, Sept. 19, 1844.

EARLIEST STRAWBERRY in CULTIVATION. —Strong Plants of the "PRINCESS ALICE MAUDE" STRAWBERRY, which has proved itself to be the earliest grown in this country, are now ready to be sent out at 30*s*. per 100. As an Early Strawberry, it has taken the First Prize at all the Horticultural Exhibitions in the early part of the season. Also Plants of the "British Queen," "Deptford Pine," "Prince Albert," and all the leading kinds. To be had of Messrs. Warner & Warner, Seedsmen, 28, Cornhill, London.

CAMELLIA JAPONICA.

ROBERT LAWSON, Esq., of Tiverton, intends disposing of his stock of Camellias, which he has collected at much expense, and successfully cultivated for many years. They are in the highest state of health, and most abundantly set with blooming buds. Mr. L. disposes of them solely in consequence of their having become too large for his conservatory. They are as follow:—

				£	*s*.	*d*.
Reticulata,	from 7 to 8 feet in height, a very fine specimen, quite healthy and green			10	10	0
Imbricata,	from 7 to 8 feet in height,		do.	8	8	0
"	" 3 to 4	"		1	10	0
Eximia	" 7 to 8	"	a magnificent plant	7	7	0
Chandlerii	" 6 to 7	"	a fine plant	5	5	0
"	" 3 to 4	"		1	10	0
Lady Hume's Blush	6 to 7	"	fine	4	4	0
Double White	6	"		5	5	0
" "	5 to 6	"		3	10	0
"	5	"		2	10	0
Invincible (Gray's)	5 to 6	"		3	3	0
Fordii	" 4 to 5	"	very fine	4	4	0
" "	2 to 3	"		1	1	0
Double Striped	5 to 6	"	fine	2	10	0
Anemoneflora Alba	4 to 5	"		2	10	0
Speciosa	" 4 to 5	"		2	2	0
Woodsii	" 4	"	fine	2	10	0
Warratah	" 4 to 5	"	fine	2	2	0
Florida	" 4 to 5	"		2	10	0
Corralina	" 3	"		1	5	0
Lawsonii	" 2	"	new	1	10	0
Colvillii	" 2	"		0	10	6
Donkelærii	" 2	"		0	10	6
Insignis	" 6 to 7	"	very fine	2	10	0
Eclipse (Press's)	6 to 7	"		3	3	0

The Prices affixed are for the separate plants, of which not less than 8 can be taken together. If the whole are taken in one lot a considerable reduction will be made. Mr. Lawson will be happy to show them, or give any further particulars that may be required.—Tiverton, Sept. 20th, 1844.

MR. LYNE'S NEW SEEDLING GERANIUMS.

WILLIAM E. RENDLE has much pleasure in offering to the Nobility, Amateurs, and Trade the following new varieties of GERANIUMS raised by P. E. Lyne, Esq., the entire stock of which he has succeeded in obtaining.

Lyne's Princess Alice	each	£1	1*s*.
Lyne's White Perfection	"	1	1
Lyne's Imogene	"	1	1
Lyne's King of Saxony	"	1	1
Lyne's Redworth	"	1	1
Lyne's Confidence	"	1	1
Lyne's Sappho	"	1	1

The whole set as above for six guineas. The usual discount to the Trade.

"Princess Alice" has received two seedling prizes in London. "White Perfection," first prize at Torquay, and the Gold Medal at Plymouth. "Imogene" is described in the *Chronicle*, June 24th, 1843. They all possess most desirable properties, and can be highly recommended as being first rate flowers.

W. E. R. has been induced to offer the above at prices considerably lower than usually obtained for such valuable varieties, in hopes thereby to meet with a more extensive demand. Descriptions can be obtained on application.

Orders will be executed in strict precedence. Plants will be delivered in October next. Reference or remittance required from unknown correspondents. Plants will be added to compensate for carriage.—Union Road Nursery, Plymouth, Sept. 20.

TRUE HIGHLAND PINE.

JAMES GRIGOR, Nurseryman, Norwich, begs to call the attention of the Land Proprietors of England to this very desirable variety of Pinus sylvestris, which has been raised from seeds collected on the mountains of Strathspey, and of which he has strong plants ready to be sent out. For introducing this tree Messrs. Grigor, of Forres and Elgin, were awarded several premiums by the Highland and Agricultural Society of Scotland; and in that part of the country this Pine is rapidly superseding the common soft-wooded variety. For all economical purposes its chief merit consists in the hardness and durability of its wood; hence it is much sought after at present for railway sleepers. Pictorially considered, or as a landscape ornament, it rivals even the Cedar of Lebanon. Sir Walter Scott describes it as assuming much of "the bold and contorted figure of the Oak;" and in the last No. of the *Quarterly Review* it is recommended as a fit tree to be planted in churchyards and cemeteries.

Strong plants in pots, such as rabbits and hares will not destroy	6*d*. each.
Ditto, not in pots, 18 inches high	30*s*. per 1000.
Ditto " 15 "	20*s*. "
Ditto " 1 foot high	15*s*. "
Ditto " 3 years old	10*s*. "

J. G. would recommend all who require them to furnish themselves immediately with these Pines, and to plant them forthwith. Spring planting is exceedingly hazardous; and when followed by such a season as was experienced during the commencement of the present summer, the young trees are sure to be killed.

Cedrus Deodara raised in the open ground, being the strongest plants yet offered in England, 10*s*. each. Araucaria imbricata, Pinus excelsa, Laricio, Austriaca, &c. &c. on reasonable terms.

ROSES.

WOODLANDS NURSERY, Maresfield, Near Uckfield, Sussex.

W. WOOD & SON have the honour to announce that they are now issuing GRATIS, on application, their newly-arranged CATALOGUE OF ROSES, containing a full and comprehensive description of all the most popular varieties, in addition to the novelties that have appeared this season.

Catalogues may be had at Edinburgh, of Mr. R. T. M'Intosh, 12, Catherine-street. Woodlands, September 20.

SHRUBBY CALCEOLARIAS, PANSIES, &c.

H. MAJOR, of Knosthorpe, near Leeds, begs to intimate that he can supply healthy plants of the best twelve varieties of Calceolarias he sent out for the first time last spring, for 25*s*. post-free. Plants procured now will bloom early in the spring.

H. M. has plants of most of the leading sorts of PANSIES; the following 24 select kinds he offers for 24*s*. post-free:—viz., Bridegroom (Major's), Bridegroom (Widnall's), Black Prince, Black Bess, Conservative, Curion, Eclipse, Glory of Knosthorpe, Maid of Milan, Oliver Moonshine, Queen of Whites, Success, Unique, William Tell, Mrs. Harcourt, Sulphurea elegans, Exquisite, Regulator, Miss Batty, Lady Alice Peel, Azurea, Leader, Hector, and Black Dwarf. The present is a proper time for planting Pansies for a spring bloom. Additional plants will be sent to compensate for carriage by hamper.

Packets of Select Pansy-seed, saved from most of the leading varieties, and from several superb Seedlings, at 2*s*. 6*d*. and 5*s*. per packet.—A remittance from unknown correspondents is respectfully requested.

Mr. M. will next spring have to offer a new set of splendid Seedling Calceolarias, raised this year; as well as several Seedling Pansies, among which will be found an excellent white (superior to any out), a creamy white, one with clear white centre and delicate lilac border, and one similar in character to his unrivalled "Bridegroom," but of different colour. Also a few choice Carnations and Picotees, correct in name, sort, and colour.

DOUBLE ROMAN and PAPER-WHITE NARCISSUS, 4*s*. per dozen. The above Bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have been just received at A. Corbett's, late Mr. Barron's, Italian and Foreign Warehouse, 18, Pall Mall. Also Dutch Hyacinths, Crocus, Tulips, Anemones, &c. &c. Price Catalogues of which may be had per Post.

DUTCH HYACINTHS.

WARNER AND WARNER, Seedsmen, No. 28, Cornhill, London, respectfully inform the Nobility and Gentry their Dutch Flower-roots have arrived in superior condition, consisting of the choicest and newest varieties. The Bulbs are unusually handsome and large, at moderate prices. Catalogues forwarded by post on application.

CARNATIONS AND PICOTEES.

JOHN DICKSON, Acre-lane, Brixton, Surrey, has prepared for the growers of these splendid flowers a Catalogue, enabling them to judge of their qualities, with the prices annexed, which may be had at the Nursery, and of Messrs. WARNER & WARNER, Cornhill, London, after the 7th September.

SPLENDID NEW HEAVY-EDGED PURPLE PICOTEE, WOOD'S "PRINCESS ALICE."

JOHN WOOD begs to announce that the stock of this superb flower is now ready for sale at 15*s.* per pair, postage included. It has gained the following prizes:—At Cambridge Florists' Show, 1843, it was the 1st seedling, and the 1st heavy-edged purple; at the same Show, in 1844, it took the premium prize, beating all the Picotees exhibited. At Huntingdon, 1843, it was 1st seedling and 1st purple Picotee; at the same place, 1844, it was 1st, 2d, 3d, and 4th, excluding every other flower. At Peterborough, 1843, it was the 1st seedling, took 1st pair of purple, and was in the best stand of six Picotees; in 1844, at the same Show, it took the 1st pair, and was again in the 1st stand of six.

J. W. flatters himself that this statement precludes the necessity of farther comment. Plants of the above may also be had of HURST and M'MULLEN, 6, Leadenhall street.

J. W. has a few pairs of that splendid Pink Garratt's "Queen of Roses," for sale, at 7*s.* 6*d.* per pair; his Catalogue of Carnations, Picotees, &c., may also be had on prepaid application; and those about to commence growing, he will supply as follows, if left to his selection.

CARNATIONS AND PICOTEES.

			£	*s.*	*d.*
50 pairs good sorts, one pair of each			3	0	0
25 do.	do.	do.	1	10	0
24 do.	fine show flowers		2	0	0
12 do	do.		1	0	0

PINKS.

50 pairs good kinds, one pair of each			1	0	0
25 do.	do.	do.	0	10	0
24 do.	fine show flowers		0	18	0
12 do.	do.		0	9	0

N.B.—Remittances must accompany the orders of unknown correspondents.—Nursery, Huntingdon.

MR. HOYLE'S NEW SEEDLING GERANIUMS.

WILLIAM MILLER respectfully announces to the Nobility, Gentry, Amateurs, and the Trade, that he has purchased the entire stock of the following superb SEEDLING GERANIUMS raised by G. W. HOYLE, Esq., of Guernsey, viz.

		£	*s.*	*d.*
1844—Titus	each—	3	3	0
Pompey		3	3	0
Champion		2	2	0
These three for six guineas.				
1843—Unique		1	1	0
Queen of England		1	1	0
Claude		1	1	0
Sarah Jane		1	1	0
Amelia		0	10	6
Majestica		0	10	6
Rosalia		0	10	6
Flora		0	10	6
General Pollock		0	10	6
These nine for five guineas.				

The entire set 10 guineas, with a discount of 20 per cent. to the Trade. A remittance must accompany the order from unknown correspondents.

Titus received a seedling prize at Chiswick, June, 1844; Pompey, Champion, and Unique were pronounced by Professor LINDLEY, in the *Gardeners' Chronicle* of June 29, 1844, to be "three flowers of good substance, size, and variety;" and Mr. Glenny, in *Gardeners' Gazette* June 22, 1844, says, speaking of the Geraniums at the Chiswick Fête—"Mr. Hoyle had by far the best lot there; Pompey was the best of them, and Titus next." Blooms of the others were likewise exhibited at the June Fête, Chiswick, 1844, and attracted very extraordinary attention, and were universally admired. On the whole, the above varieties, for substance, roundness of form, and general excellent qualities, are among the best ever offered to floriculturists. Painted Lists, with full descriptions, can be had on application. To commence sending out plants in October.

W. M. has been supplied by Mr. Hoyle with some choice GERANIUM SEED, which he saved from his own beautiful Seedlings, and the newest and best varieties sent out by other growers. Sealed packets of 100 seeds, 12*s.*; do. of 50 seeds, 7*s.* Also, Hybridised Seed, saved from his own extensive collection of Pelargoniums; packets of 100 seeds, 10*s.*; of 50 seeds, 6*s.*

Providence Nursery, Ramsgate.

Spirea Reevesiana, 5*s.*
Viburnum cotonifolium, 3*s.* 6*d.*

Also the following, in collections:

100 Cape Ericas of 100 distinct sorts, (including many fine sorts) 5*l.*
12 Epacrises of 12 distinct sorts, (including Campanulata rosea) 21*s.*
12 Azalea indica, of 12 distinct sorts, (including fulgens) 21*s*

THOMAS JACKSON, Kingston Nursery, Surrey, Sept. 20.

FUCHSIA "PRINCESS ALICE."

G. H. BUNNEY having purchased the stock of the above splendid Fuchsia—which was awarded the first Prize at the Royal Botanic Society's Exhibition, Regent's Park, in June last, when it was very much admired for its profusion of fine thick flesh coloured and pink flowers, and fine habit of plant; it also was awarded the first Seedling Prize at the South Essex Exhibition in Wanstead Park, on Sept. 4, the only place exhibited—plants of the above Fuchsia will be sent out early in October at 5*s.* per plant, with a discount to the trade when six plants are taken; likewise 4 Seedling Cinerarias.

BUNNEY'S ECLIPSE, 3*s.* 6*d.*, fine red, gained 1st Prize at the Royal Botanic Society, Regent's Park, June Show, and Wanstead Park.

BUNNEY'S DIANA, 3*s.* 6*d.*, white, deeply margined with purple, fine broad petals, and excellent habit.

BUNNEY'S NERO, 2*s.* 6*d.*, very dark-blue, fine habit.

BUNNEY'S VESTA, 2*s.* 6*d.*, light blue, very distinct colour.

Or the above 4 for 10*s.*

MIMULUS SPLENDENS, 2*s.* 6*d.*, fine scarlet profuse bloomer, of fine shrubby habit, was awarded a Prize at the Royal Botanic Garden, July Show. All orders for the above, addressed to G. H. BUNNEY, Maryland Point Nursery, Stratford, Essex, (late of the Kingsland Nursery) will be punctually attended to.

CHOICE FLOWERS AND PLANTS IN POTS.

SMITH'S FIELD and GARDEN SEED-DIBBLE, or HAND MACHINE, for depositing all kinds of Seed on the various Soils, with the greatest accuracy and despatch.—This Machine is so simple in its construction and operation as not to be liable to get out of order, and can be used by men or women. It is easily set, so as to deliver the exact quantity of seed intended to be planted, into each hole made by the Dibble, at one operation, without any further care than supplying it with Seed, by the person using it, and will plant Turnip and Mangold Wurzel Seed, Wheat, Barley, Peas, and all kind of Garden Seeds. In Tin, 1*l.* 10*s* each; or with Copper Box and Tube, 1*l.* 15*s.* each. Commission allowed to Agents.

These Dibbles may be obtained of Messrs. COTTAM and HALLEN, 2, Winsley-st., Oxford-st., London, through the agency of the principal Agricultural Implement Sellers in the United Kingdom; or from the Inventor, by letter to his address, inclosing a Post-office order for the amount.—RICHARD SMITH, Upper Hall, near Droitwich, Worcestershire.

HOTHOUSES, CONSERVATORIES, &c., made and fixed Complete in all parts of the Kingdom. One, two, and three-light Cucumber and Melon-Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from 1*l.* 8*s.* Garden-Lights made and glazed from 1*s.* per foot, at JAS. WATTS' Sash Manufactory, Claremont-place, Old Kent-road. *** Reference given.

EXTIRPATION of the MEALY-BUG, THRIPS, &c.—These pests to Gardens can be readily and effectually extirpated without injury to the most delicate plants, by HEREMAN'S VEGETABLE DILUTIUM, sold in bottles at 5*s.*, 10*s.*, and 20*s* each, free of carriage to all parts of Great Britain.—Address, with a remittance, either to SAMUEL HEREMAN, Romsey, Hants, or Messrs. MARNOCK and MANLY, Nurserymen, &c., Hackney, who are the sole London Agents.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

Sales by Auction.

TO GENTLEMEN, BUILDERS, NURSERYMEN, AND THE TRADE.

MESSRS. PROTHEROE AND MORRIS are instructed to Sell by Public Auction under a [illegible] on the premises, Sussex Nursery, Loughboro' Road, [illegible] on Monday, 30th September, 1844, at eleven [illegible] whole of the NURSERY STOCK, consisting in [illegible] greens and Flowering Shrubs, Standard and Dwarf [illegible] two newly-erected Greenhouses, Frames, about [illegible] house Plants, a quantity of Rock Work, Utensils in Trade [illegible] may be viewed prior to the sale. Catalogues may [illegible] the premises, of the principal Seedsmen, and of the Auctioneers, Leytonstone.

FREEHOLD NURSERY-GROUND, ST. ALBAN'S [illegible]

MESSRS. PROTHEROE & MORRIS have received instructions from the Executors of [illegible] Robert Fullwood, the mortgagee, to submit to public competition at the Auction Mart, Bartholomew-lane, on Friday, October, 1844, at One o'clock, THE KEY FIELD NURSERY [illegible] comprising a comfortable and convenient Dwelling House fronting the High Road from St. Alban's to London, and [illegible] acres of very productive Nursery and Garden Ground. Freehold and Land-Tax redeemed, and immediate possession may be had. The Premises were late in the occupation of David Watson, who for many years and up to the period of his death carried on the business of a Nursery and Seedsman. May be viewed at any time, and particulars had at the principal Inns in the neighbourhood, at the Auction Mart, of J. S. Story, Esq., Solicitor, St. Alban's; of George Drew, Esq., 185, Bermondsey-street, Borough; and of the Auctioneers, Leytonstone, Essex.

BUNNEY'S FINAL SALE.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by the Proprietor (in consequence of the Lease having expired), to submit to Public Competition by Auction, on the Premises, Kingsland Nursery, Balls Pond-road, on MONDAY, Oct. 7, 1844, and following days, at Eleven o'clock each day without reserve, the whole of the valuable NURSERY STOCK, consisting of FRUIT and FOREST TREES, a considerable quantity of EVERGREENS, AMERICAN PLANTS, STOOLS, &c. The Stock is particularly worthy the attention of Noblemen and Gentlemen laying out their Grounds; also the Trade, from its excellence, and comprising an excellent collection of Ghent AZALEAS, MAGNOLIAS, RHODODENDRONS, &c. May be viewed prior to Sale. Catalogues may be had on the Premises, of the principal Seedsmen, and of the Auctioneers, Leytonstone.

ISLINGTON NURSERY.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, and Others.

MESSRS. PROTHEROE AND MORRIS are instructed by the Proprietor to submit to Public Competition, on MONDAY, 14th October, 1844, and following days, at 11 o'clock, (in consequence of the ground being required for building,) a portion of the valuable NURSERY STOCK, consisting of about five thousand Belgian Azaleas, in 40 fine varieties; several thousands fine Hybrid Rhododendrons, well furnished with bloom buds; Green and Var. Hollies, Chinese and Siberian Arborvitæ, about five thousand Laurels, with a fine assortment of Fruit and Forest Trees, Flowering Shrubs, &c.

May be viewed prior to the Sale. Catalogues may be had on the Premises; of the principal Seedsmen; and of the Auctioneers, American Nursery, Leytonstone.

SIX DAYS' SALE OF VALUABLE NURSERY STOCK.

MESSRS. PROTHEROE & MORRIS will submit to Public Competition, by Auction, at the American Nursery, Leytonstone, Essex (about one mile from the Railway Station, Stratford), on Monday, 21st October, 1844, and five following days, at 11 o'clock, (to close Executors' accounts), the celebrated NURSERY STOCK, consisting of the choicest kinds of Fruit and Forest Trees, fine Evergreens, Ornamental, Deciduous, and American Plants, of every variety, in extensive quantities, and lotted to suit every description of purchasers. The Stock is particularly worthy the attention of Noblemen and Gentlemen laying out their grounds, from its having many rare specimens that are only to be found in first-rate collections (also of the Trade, from its excellence), and comprising about [illegible] thousands Azaleas, Rhododendrons, Ledums, Andromeda, and fine condition for potting, being well furnished with bloom buds, in fine condition for potting, being well furnished with bloom buds, and peculiarly adapted for safety of removal, the mould adhering to the roots. May be viewed prior to the Sale. Catalogues, One Shilling each, returnable to purchasers, may be had of the principal Seedsmen in London, at the Auction Mart, and of the Auctioneers, Leytonstone, Essex.

VERY ELIGIBLE FARM.

TO BE LET on LEASE, from Michaelmas next, Forest Lodge (otherwise Llosgoed), six miles from Brecon, and 15 from Merthyr; containing 700 Acres of Land of the best quality, and in excellent condition. It has a Threshing machine and a Corn and Bone mill, all worked by water, extensive Barns and Cattle-sheds, a very large Piggery, a Steaming-house, Liquid Manure Tank, and all requisites for the scientific cultivation of the Farm. An excellent Sheep-walk of 700 acres can be attached, if desired. The whole is well situated as to roads.—Apply to Mr. DRAYCOTT, Glanusk, Lenny Bridge, Brecon; or to Mr LARGE, Bassel Down House, Swindon.

TO MARKET GARDENERS.

TO BE LET at EALING, six miles and a half from London, a GARDEN of 11 ACRES, with House, Stable, &c. Possession may be had immediately.—For particulars apply at Mrs. ROBERTS's, on the Green, at Ealing.

TO AGRICULTURISTS.—Any person wishing to enter into a Large Farming Business, 30 miles from London, and near a Railway Station, at Michaelmas next, may hear of a very favourable opportunity by addressing a letter to A. B., Penshurst, Kent.

CONICAL BOILERS.—The Boilers invented by JOHN ROGERS, Esq., are made of several sizes, and may be obtained of JOHN SHEWEN, Ironmonger, Sevenoaks, Kent.

They may be seen in operation at Messrs. Chandler's, Vauxhall; Loddiges', Hackney; Henderson's, Pine-apple place, Edgware-road; Rollisson's, Tooting; Pontey's, Plymouth; The Horticultural Society's Gardens, Chiswick; and in the Gardens of the Royal Botanical Society, Regent's-park.

POTTER'S GUANO MANURE is the only Guano that can positively be depended upon, and has stood the test of three seasons. The imported article, it is well known, is seldom twice alike, even when genuine, and is subject to a most extensive system of adulteration. Orders addressed as to the Works, 22, Upper Fore street, Lambeth, will have immediate attention. Testimonials will be sent per post, if required.

POTTER'S LIQUID GUANO may be had as usual of most Chemists and Seedsmen.

*** Beware of being imposed upon by inefficacious imitations.

NEW PLANTS.

MESSRS. VEITCH AND SON have now ready for sending out the two undermentioned beautiful New Plants, viz.:—

HINDSIA VIOLACEA. Strong plants at 63*s*. It is figured by Dr. LINDLEY, in the "Botanical Register" for August last, who there says—"The Hindsia violacea is one of the finest things obtained from South Brazil. It has been imported by Messrs. Veitch and Son, of Exeter, who received for it the Large Silver Medal at the Horticultural Society's Garden Exhibition in May last. It will doubtless prove a very easily cultivated Greenhouse Plant: and is certainly unsurpassed in beauty by blue-flowering shrubs."

CLITORIA FULGENS. Strong plants at 42*s*. This plant was exhibited at Chiswick, in May, under the name of Centrosema species, and received the Knightian Medal. See Report in *Gardeners' Chronicle* for May 25. It is figured in "Paxton's Magazine" for July last.

Messrs. V. and Son have also to offer the following fine plants, viz.:—

Achimenes picta
Allemanda grandiflora
Barbacena squamata Veitchia
Clerodendron lævifolium
" splendens
Cyrtoceras reflexa
Echites atropurpurea
" hirsuta
" splendens
Gardenia Rothmannia
Gardenia Sherbournea
" tetrasperma
Gesneria polyantha
Gloxinia Cartonii
Hindsia longiflora
Inga pulcherrima
Luxemburgia ciliosa
Passiflora actinea
Pentas carnea
Thunbergia chrysops, &c. &c.

N.B.—Messrs. V. and Son's General Catalogue can be had on application.—Exeter, Sept. 19, 1844.

The Gardeners' Chronicle.

SATURDAY, SEPTEMBER 21, 1844.

MEETINGS FOR THE ENSUING WEEKS.

SATURDAY, Sept. 28 Royal Botanic
TUESDAY, Oct. 1 Horticultural . . . . 3 P.M.
FRIDAY, Oct. 4 Botanical . . . . 3 P.M.
COUNTRY SHOW.—TUESDAY, Sept. 24, Chichester Horticultural 2 P.M.

THE Vine, say English GRAPE-GROWERS, likes a moist rich soil; so give it plenty of manure, of horseflesh and swineflesh, and other good things; make it grow rank, fill your houses with strong long rods, and when you have got them—cut them off again. The Vine inhabits one of the hottest countries beyond the tropics; so, say English Grape-growers, plant it on the outside of a house, where the soil is coldest, if you want to force it. It fruits in perfection in the burning soil of Syria and Sicily. When the spies came to Moses out of the land of Canaan, "they came unto the brook (valley) of Eshcol, and cut down from thence a branch with one cluster of Grapes, and they bare it between two on a staff." But our climate gives our Vines deluges of cold water, or we warm their roots by fermenting stable litter, whose influence hardly extends beyond the surface of the ground; and, strange as it may seem, by such means English gardeners get the finest Grapes that are known beyond the limits of Vine cultivation in the open air.

It would, therefore, seem that we are right, and that the peculiarities of our climate render necessary this departure from the natural habits of the Vine. But seeming may not be reality; and it is quite possible that if gardeners grow admirable Grapes by violating every principle that one would think should guide them, they may grow them still better by attending to those principles. We cannot seriously believe that the Vine loves the coarse and watery food we give it: all that we can imagine is that it will bear it.

"Some years since," says Mr. Hoare, in his recent work on the Vine,* "I received a bundle of Vine-cuttings from one of the most celebrated Vineyards in Spain. They were the entire growth of the year, as each had a portion of the preceding year's wood attached to it. The longest shoot measured 8½ feet, but the average length was about 8 feet. The wood was perfectly cylindrical, of the closest texture, and *almost as hard as heart of Oak*. The buds were large, prominent, and highly symmetrical, *and stood out in bold relief on the sides of the canes*."

Now, who ever saw such wood in England? and how can we expect to have Grapes of Spanish excellence without wood of Spanish quality? And hence, for such and other reasons, which are urged with full knowledge of his subject, Mr. Hoare maintains that the system of English Grape-growing requires to be changed.

We are not prepared to go so far as he does; for he should have shown to what size the bunches of Grapes had arrived which were obtained from his Spanish Vines, before he accepted them as conclusive proof that such hard short-jointed wood is indispensable to good Grapes. But we think that his arguments deserve very serious attention, and cannot fail to lead to most important changes in the cultivation of the Vine. What we most doubt is, whether the hard-wooded short-jointed Spanish wood produces large bunches of juicy berries as well as Grapes of high flavour. If it does not, our own *unprincipled* practice will still prevail to a great extent. Mr. Hoare seems to be of opinion that it did or would.

As we cannot change our sun and air, we must try to mend our ways. Since frost and snow will come, and cold rain will lodge in our Vine-borders, in spite of all our dislike to it, we must oppose those disadvantages by skill. Mr. Hoare, considering, it may be presumed, that houses are sufficiently well heated, and Vines as well pruned and managed as they can be, directs attention to the Vine border—to the badness of which, in one respect or another, he attributes all the disasters of Grape-forcing; and his little book is written principally to advocate this side of the question. That he will have offended prejudices by his views is certain; that the clans Do-little, Do-nothing, and Stand-still, will ridicule his book, we doubt not. But he need not be alarmed; although these once were formidable bodies, and ruled the land of gardening, they are now but broken men, without a head to lead them. We happen to know that Mr. Hoare's statements are the result of actual experience, and that all which he recommends has been repeatedly and cautiously examined experimentally. For many years his observations have been conducted with the utmost care. By depositing a great variety of substances in excavations made for the purpose, mixing them in different proportions, changing them in almost every conceivable way, planting Vines in them, and then, after a year or two, pulling the plants up again, and then examining their roots minutely, he has been able to ascertain what the substances are which the Vine roots select to feed upon. And by repeating this process for many years, he has arrived at the conclusions which have led to the recommendation contained in the work before us. Need we say more to insure to them the attentive consideration of sensible men?

We shall not pretend to repeat the arguments upon which Mr. Hoare grounds his opinions; we shall only say that they are for the most part satisfactory to us. Our previous observations would, however, have no practical application if we did not mention what the materials are which he proposes to substitute for the ordinary Vine-borders. "These are *broken bricks, lumps of mortar, charcoal* and *bones*. The three first should be reduced to the size of a hen's egg, or thereabouts. Larger or smaller fragments will do, but when they are about this size they are better calculated to retain the requisite degree of moisture in connection with the greatest possible extent of surface. The bricks should not be too hard burnt, because their porosity is thereby lessened. Old mortar should be preferred to new, when it can be procured. The bones may either be broken into fragments or deposited whole, and the fresher they are the better. Any description of bones will do, provided they are those of animals arrived at maturity, and are therefore of a solid and lasting nature. Such as have marrow in them should be broken asunder, that the interior surface may be available to the roots of the Vines; and the lighter and more porous the charcoal is, the better will it answer the intended purpose. The whole of these materials should be used in equal proportion, measure for measure, and should be well mixed together. But before this is done, the bricks, mortar, and charcoal *should be well soaked in urine, and then used immediately*. And as these substances convey to the roots of Vines an extraordinary supply of nutriment in a highly concentrated form, a small quantity in bulk, in proportion to that of common soil, will be amply sufficient to support a single Vine for a long series of years."

In addition to this, he protests most strongly and sensibly against planting Vines that are to be forced in borders exposed to the open air. Surely nothing can be more obviously wrong than this. What Mr. Hoare says is very true. The roots of Vines in a cold border do not move because the branches leaf. On the contrary, for months the leaves are supported by the sap contained in the buds and branches, while the roots are still asleep; that sap becomes exhausted; nothing replaces it, for the benumbed roots cannot stir; and then, when the fruit should swell off and repay the expense incurred in Vine-borders and Vine houses, it shrivels and shrinks—produces verjuice instead of sugar.

But this subject is capable of more extended application, in Mr. Hoare's opinion, and we must revert to it next week.

SINCE our observations upon the value of SULPHATE OF IRON for purifying offensive collections of decaying matter were printed (p. 555), some further information upon this subject has reached us.

Sulphate of iron seems to fulfil every condition that can be required of such an agent, where the material to be sweetened is inclosed in receptacles of some kind, the contents of which do not escape. But where the offensive matter is acted upon by water, which is continually escaping through drains or floating off by sewers, it is to be expected that a considerable waste of a material so soluble as this iron salt will take place; for it is obviously impossible to calculate with any sort of accuracy how much putrid fluid has to be operated upon in a given time, or the strength of such fluid.

For this reason it has been proposed by M. Siret, a French gentleman having great experience in the purification of drains and sewers, to unite the very soluble salt of iron with some material which will prevent its rapid dispersion, and he has found that the following mixture answers the purpose perfectly. Take

Sulphate of iron	200 kilogrammes.*	
Sulphate of zinc	25	"
Vegetable charcoal	10	"
Plaster of Paris	265	"
	500	"

Blend these substances thoroughly, and then add water to them till they form a solid mass. Of such a mass 75 kilogrammes, or about 165 lbs., placed at the mouth of a sewer, will keep 500 yards sweet for a fortnight; "the fluids gradually dissolving themselves as they pass over it, and thus becoming pure. At least such is the result of the experiments at Meaux, in the Brassat sewer, which takes the drainage of the leather-dressing factories. The use of plaster of Paris, which holds together the disinfecting powders, does not decompose them; on the contrary, it excites rather than diminishes their sweetening effects."

We do not understand the necessity of adding a salt of zinc to the "Siret cake," and are not without fear as to its effect upon manure, which it may render less fit for vegetation than without it. The experiment is, however, worth the making, and also, considering the vast interests involved in such an inquiry, the varying, according to circumstances. A man must have very little ingenuity who cannot perceive to how many places besides sewers and drains the "Siret cake" is applicable, not merely in the country, but in London. Parish officers especially should, without loss of time, turn their attention to the application of some such processes as those of Messrs. Schattenmann and Siret, to purposes, the necessity for which need not be more particularly alluded to.

WASPS.

SOME of your correspondents, as well as other parties, have not been so successful as they might have been in applying spirits of turpentine to the destruction of wasps' nests. I observe that one person says he found the wasps alive on the morning after he had applied the turpentine. If he refers to the former accounts, describing successes, he will see that 24 hours is the time specified before the wasps are killed. If he had waited till the following morning he would probably have insured success. The attack may be rendered more powerful by stuffing tow or cotton-wool into the bottle, well soaked with turpentine. Where the destruction of the nest is the only object, I should very much like to have it ascertained whether anything further is necessary than to inject the turpentine, and block up the hole. From what I have observed of the nests I have examined after 36 hours from the time I had applied the turpentine, they were so much filled with dead wasps, and there was such an evident tendency to incipient mouldiness and decay about them, that I should suppose the whole would have become a mass of corruption in a day or two more; and that all the maggots in the cells must then inevitably have perished. When the nest is taken out before it becomes corrupt, those maggots which have assumed the pupa state readily hatch; of which I have at this moment ample experience in a nest I took up a fortnight ago, and have kept in an outhouse for purposes of observation. The wasps are flying in and out of the door by hundreds. The best way of preserving these interesting objects is to dig up a cubical mass of the earth, and carry it away with the nest in the middle: which can be done where the soil is sufficiently tenacious. The soil may be wetted with a weak solution of glue, which will bind it firmly together when dry. The nest may then be exposed on two opposite sides, leaving the other two to support the roof. A portion of the outer case must be removed, for the purpose of extracting the dead wasps, and also as many of the live maggots as can be got at with a long pair of forceps. This opening also serves to expose the internal arrangement of the cells. It is interesting to preserve the entrance-hole entire. I believe there was not one person in this village who was at all acquainted with the actual appearance which an entire wasps' nest presents, until I exhibited some which I had prepared. They had blown up many with gunpowder, and had dug them out in a confused mass, and were not even aware that they had an outer coat, as the wasps hollow out the large cavity in the ground, from the roof of which they suspend the nest, by carrying out the earth in small particles, and the stones continue subsiding to the bottom, and may always be found forming a rude pavement below. Some large stones are sometimes so gradually exposed whilst the nest is increased, that I have found them completely embedded in the midst of the comb. Indeed, there are many little interesting particulars connected with the economy of wasps which I have noticed since I came to reside in the country; and if those of your correspondents and readers who take delight in contemplating the works of Nature, will be at a little pains in examining and preserving some of the wasps' nests they wish to have destroyed, they will not find their labour lost. I will mention, for the sake of

* A Descriptive Account of an Improved Method of Planting and Managing the Roots of Grape-Vines. By Clement Hoare, 12mo, Longmans, 1844.

* A kilogramme is rather more than 2lb. 3oz. The substance may of course be made on a small scale, with 20lbs. of sulphate of iron, 2¼ lbs. of sulphate of zinc, 1 lb. of charcoal, 26¼ lbs. of plaster of Paris.

persons unacquainted with entomology, that we have four species of wasps in England; two of these build their nests above ground, and two under ground. Of those that build above ground, the hornet (Vespa crabro) makes use of materials collected from rotten wood, and the other (Vespa britannica) from sound wood; and the same distinction in the materials is also observed in the nests of the two underground builders. The common wasp (V. vulgaris) uses the fibre of sound wood, whilst the anchor-faced wasp (V. rufa) collects only from rotten wood, like the hornet. The two underground species appear to be equally common in this neighbourhood. Beautiful figures of Vespa rufa are given in Mr. Curtis's "British Entomology." The materials of which the comb is made so closely resemble paper, that I have a specimen where the wasps had worked up a piece of blue paper to serve their purpose; and I think it very possible that they may not unfrequently avail themselves of similar substances, though we should hardly detect the source from whence they had obtained their materials, if it did not happen to be so highly coloured as in the instance I have noticed. How marvellous it is that a single queen should have been ascertained to lay as many as 20,000 eggs! I have found as many as 500 young queens in a large nest. I once brought home in a bandbox a hornet's nest, which I took out of the roof of a cottage, after destroying all the neuters, partly by turpentine and partly by catching them with a forceps. Upon placing the nest under a large bell-glass, with a little spirits of turpentine, out came about 150 hornets, half of them drones, and the rest young queens. It was rather lucky there were no neuters left, or I might have been more severely stung than would have been agreeable; the queens were too sluggish to attack me.—*J. S. Henslow, Hitcham.*

DISEASES OF PLANTS.—No. III.

[FUNGI.]

BEFORE we enter more particularly upon the subject of the diseases of plants, as produced by Fungi, it will be right to say a few words respecting the parasites themselves. They are divided into two great classes, distinguished by the structure of their parts of fructification. In the one, (figs. 1 and 2) the reproductive bodies are produced externally, and very frequently in definite numbers, as two or four, at the extremity of certain privileged cells or threads, which arise from the common mass of cells, forming a more or less compact tuft or disc, or built up into variously-shaped processes, as gills, tubes, &c., which distinguish the several genera; or, in the second case, (fig. 3) within the cavity of certain cells distinguished generally, as in the former case, from the other constituent cells, and most frequently eight in number, disposed in one or two rows.

1. — *Agaricus elixus*, (Sow.) Sporophore, with its four long sterigmata and small spores.
2. — *Agaricus semiovatus*, (Sow.) Sporophores, with their four sterigmata, and spores in various degrees of development.
3.—Helvella elastica; asci, and sporidia.
4.—Sporidium of Tuber magnatum (Piedmontese truffle), with its ascus, from a sketch sent by Dr. Montagne.
5.—Sporidium of Peziza aurantia, with its two nuclei.
6.—Single sporidium with its large globose nucleus.

This distinction, however, though apparently so simple, and confessedly of the very greatest importance, is, unfortunately, not always very easy of application. In some cases, from the minuteness and tenderness of the parts of fructification, and the extreme flaccidity of the neighbouring cells, it can only be ascertained by very nice manipulation, and a practised eye; and often, in particular stages of growth, the vegetation is so rapid, that an hour or two will induce such changes as completely to mask the original structure. In other cases, the two modes of structure approach each other by such nice gradations, that it is not always easy to determine with precision to which particular type a particular form of fructification ought to be referred. In the latter case, however, as in that of analogous difficulties amongst phænogamous plants, the question frequently is solved by watching the progress of germination.

Such difficulties, however, attend the naturalist in every branch of science; the most important characters are often those which are most difficult of access; but, as in the study of phænogamous plants, it is not necessary for every ordinary lover of plants to enter into all the minutiæ of structure which engage the attention of the physiologist, though all satisfactory arrangement of organised beings depends upon such points being rightly ascertained and understood. So in the study of Fungi, a little experience and tact will enable a person, without much difficulty, to refer a species to its proper place in the system.

To the first division, then, belong the greater part of those Fungi which are most attractive from their size and qualities, such as the large tribe of Mushrooms and Toadstools, together with the species, often of a leathery or corky texture, which grow on timber, producing the various forms of dry-rot, and supplying the amadou of commerce. The greater part of these have the hymenium perforated with thousands of pores, by means of which the fructifying surface is multiplied; but not a few have the sporiferous disc perfectly even, or at least only indistinctly or irregularly rugose. To the same group belongs the Puff-ball Tribe, whose structure, however, in consequence of the early stage of growth at which it is entirely effaced, has only very lately been ascertained; as is the case also with the tribe of Phalli, of which one species is well known, even to superficial observers, from its disgusting odour. A portion also of the underground Fungi has been shown by Vittadini, Klotzsch, Tulasne, and others, to possess a similar structure. And still more lately the pretty little cups like birds'-nests, which are never seen without attracting admiration, have been shown most unexpectedly, by those admirable botanists, the Messrs. Tulasne, to belong to the division in which the spores are produced externally on certain cells of the hymenium. In a portion of the Puff-ball tribe, however, which in a young state are creamy or mucilaginous, amongst which is reckoned the frothy yellow Fungus so common in hothouses, and so annoying from the dirt produced by its multitudes of sooty spores, the structure has at present not been ascertained precisely, though there is great reason to believe that they will be found to resemble, in this respect, the more known form of Puff-balls, with which they have been so long associated. After these may be reckoned the Fungi which grow on the green parts of living plants, penetrating their tissues and preying on them, which will occupy much of our attention under the various heads of Mildew, Blight, &c. To these may be added a number of minute species of various characters, which, though interesting to the systematist, are mostly of little importance as regards our present object. And lastly, a large portion of the moulds, properly so called, which are often active agents of destruction, and, as will be seen by the annexed sketch of Botrytis curta, perfectly resemble the elements of which the larger and more perfect Fungi are composed.—*M. J. Berkeley.*

APPLE ORCHARDS IN DEVONSHIRE.

A FEW years since, after a long and tedious ride from London, on the outside of a coach, during a drizzling damp day and night in autumn, I found myself comfortably settled down in Devonshire. I was much delighted with the large extent of Apple orchards: some were loaded with large quantities of pretty tempting cherry-cheeked fruit, and of others the fruit was collected into heaps, perfuming the air with such a mouth-watering fragrance that on the first opportunity I was naturally led to gratify my wishes by tasting such pretty-looking objects. I soon discovered, however, that they were not so good as they looked to be, but were grown for the purpose of being ground down for cider, which is certainly a very good and pleasant beverage when well made. In making it I find that good fruit, good, clean, sound casks, and strict attention to continually racking it when showing the least symptoms of being moved or fermented, are the principal and grand secrets for securing, in good condition, this favourite beverage.

Perhaps now, after residing in this cider-county, amongst the Apple orchards for some years, it may not be uninteresting to give some account of the method of cultivation followed in such orchards here. The trees are planted, to a large extent, apparently without considering what sort of soil or situation is best, and without making any previous preparation; a situation is chosen, a pit is dug with a curious clumsy bit of iron, having a large socket-hole at one end of it, in which is driven a long strong pole, which answers for a handle; it is worked with both hands over one knee; the depth that the roots are buried does not seem to be of any moment, provided the trees are firmly fixed, so as to prevent the wind from driving them down. I have never observed any pruning performed, except such as is done by bullocks, horses, donkeys, &c.; and as I have never observed any "horse-ladders" here in use, of course the pruning is not very effectively performed about the top part of the very lofty trees. The only digging or stirring the surface of the ground among the trees that I have observed is done by pigs, which are occasionally allowed to rove in some orchards at certain seasons of the year, with the rings taken from their snouts. In a moist season these intelligent animals occasionally turn up the ground in a tolerably regular manner; and where this is the case the good effects of their industry are obvious. However, it is only on rare occasions that they are allowed to perform this surface operation. The animals that do the pruning are the principal business-performing creatures, as, in addition to that operation, they tread down the under crop of Grass, weeds, and other rubbish, take the fruit to the cider-mill, and the cider to the consumer; besides, on rare occurences, a little manure is conveyed by them and placed over the roots, close to the trunks of the trees: it is sometimes, although rarely, placed at the great distance of three or four feet from the trunk. Bipeds, notwithstanding, perform some of the most interesting and essential parts, such as planting, collecting the fruit, consuming it in part, and assisting in making the cider; together with shooting at the trees annually on old Twelfth N[ight]. Let it rain, hail, blow, or snow, this very essential and interesting ceremony is always commenced at 12 o'clock at night, a tremendous fire being kept up for several hours afterwards. They repeat or sing the following interesting song, with all the might which their lungs will permit. The juice of the fruit is generally made use of for many hours, pretty freely, previously to this interesting ceremony, so that a perfect ripeness of address and expertness in gunnery is the result. Guns and fire-locks long laid by are on this remarkable occasion brought forward. The following is what I have heard sung on these occasions, although much more is added in some localities:—

"Here's to thee, old Apple tree,
Whence thou mayest bud, and whence thou mayest blow
And whence thou mayest bear Apples enow;
Hats-full! caps-full!
Bushel—bushel—sacks full!
And my pockets full too!
If thee does not bear either Apples or Corn,
We'll down with thy top, and up with a horn."

[*Here the natives shoot at the tree*

Not being acquainted with the custom here on the first old Twelfth Night, I must acknowledge that I was somewhat alarmed at such a continual loud and rattling report of fire-arms in every direction, living as I did in a rather retired spot, away from any other residence. It was a cold, gloomy, dark, and still night, and being suddenly awoke by the loud reports of fire-arms, I could not guess the meaning of it at that untimely hour; I imagined at first that it was an affray with gamekeepers or [illegible] or with smugglers and blockade-men; and, suddenly hearing a shrill vacant kind of hallo in a plantation close by, I fancied at first that it was some poor fellow who had been wounded in the affray: on getting up, however, I found that it was a couple of owls answering each other, they were as happy as could be, and the firing, I soon found, was in no particular spot, but went pop, bang, east and west, north and south. On making an early inquiry next morning, I was informed that it was the yearly custom.

The Apple trees, with few exceptions, are entirely left to nature, consequently they are entirely covered from top to bottom with long Moss and Lichens; the wood and branches are as thick as those of a weeping Willow; the fruit is generally very small and corey. The varieties are not numerous: they seem all in this locality to cultivate the same kinds. I have sometimes thought other good sorts could be beneficially cultivated—some of the large, free-bearing, juicy varieties, such as the Hawthornden, Keswick Codling, Kentish Beauty, Kentish Fill-basket, &c. When I make mention of those sorts, and a number of others, I am always informed that they will not answer hereabouts, although I have never met with one person that had ever attempted, or that had ever heard of any one else attempting to introduce them! I should be rather inclined to think that those large juicy kinds, cultivated for mixing with the little Bitter-sweets, would not be amiss, although I dare say, under the present system of cultivation, they would not be produced very large or juicy. The leaves of the trees show great poverty; they are small, thin, and are not much larger than Damson leaves; they turn yellow, and fall off in some localities long before the fruit has arrived at perfection; and the abundance of long Moss and Lichen in my opinion to a certain extent indicates poverty.

I will here attempt to describe three different orchards, under the management of three different persons. The first is an orchard of above 12 acres in size; the owner never digs, manures, or prunes himself, but leaves those operations to be performed by his cattle; he does not allow pigs to run in his orchard, therefore he has no digging done; and the consequence is, that he does not get a tree to bear fruit once in seven years. He lately informed me that he should not have Apples enough this autumn to make four hogsheads of cider; that the seasons were now so unfavourable he could get no Apples; and were it not for the grazing for his cattle underneath the trees, he should have no return, which was now become a very poor one. I asked him why he did not manure the trees; in reply, he observed, they have all that the cattle make among them; we do not mow, or carry anything away from them. The second is a small orchard about one acre in extent, the owner of which manures about his trees every season; here, however, there is no digging done. The trees are healthy, they grow and make wood, and produce large thick dark-green leaves and strong buds; they are not so thickly covered with Moss and Lichen, and rarely fail to bring forth a heavy crop of good fruit. This person's cider is much sought after, being good, and of course of more value. He makes a larger quantity of cider than the person mentioned above, with his 12 acres. The last is a small orchard held by another individual, who keeps no other cattle besides pigs, which are allowed to rove at freedom about the orchard; and as the rings are taken out of their snouts in autumn, when the ground is nicely softened by the rains, and the worms are working near the surface, those worthy animals rout and turn up the surface in a tolerably regular way. From the digging and manuring by the pigs, and from what the holder can muster, this is the best bearing, healthy, orchard in the district. It produces the best cider and the least Moss and Lichen. This shows how beneficial a little surface-stirring with the addition of a little manure is. A considerable quantity of cider made and consumed hereabouts is very poor, the visages of the men who are in the constant habit of drinking it are sallow and wrinkled. Only fancy drinking daily, old cider sour as vinegar!—*Zur.*

Home Correspondence.

Horticultural Society of London.—I see by the list of prizes offered by this Society for next year, as advertised lately in the *Chronicle*, that although the prizes given for some classes of plants have been justly raised in value, no addition has been made to the prizes offered in the Fruit-growers' class, at which, considering the competition that has taken place of late, and the great interest felt on the subject by all the growers of fruit, I have conversed with on the subject, I am much surprised. It appears that the Horticultural Society are placing the practical forcing gardeners in a lower class than that of the plant-growers. I hope that exhibitors of fruit at the Chiswick Shows will not rest satisfied until their exertions are as handsomely rewarded as those of the growers of stove and greenhouse plants. I shall say no more at present, but hope my brother-exhibitors will endeavour to persuade the Council of the Horticultural Society to place them on the same footing as the two other classes for which the large gold medal is awarded.—*An Exhibitor of Fruit at Chiswick.* [The best answer to this letter is, that *there was not one single letter sent by a fruit-grower* to the Vice-Secretary for the consideration of the Committee; the conclusion from which was, that the fruit-growers were satisfied.]

Gathering of Fruit.—The proper time for gathering fruit differs with almost every variety; but, generally speaking, there are only two periods for gathering, viz., summer and winter—the former for such kinds as drop from the trees between midsummer and the middle of October, and the latter for such sorts as hang upon the trees until frost brings them down. The proper time for gathering the first sorts is indicated by their colour, or more certainly by their beginning to fall; when you see a few down go to work, and, looking over the tree, pick off all the ripest, which always come down first, leaving the others on the tree until they in their turn show symptoms of being easily detached from the bough when slightly grasped by the hand; or, as before, take them when they begin to tumble to the ground. The next operation is to lay them out carefully, one by one—not placing them one upon another—in some place that is fully exposed to the sun's rays during the whole day. In a week you will see a wonderful alteration in the appearance of them, and in three weeks they will be in a fit state for storing. By this method they acquire a very superior flavour and appearance. The advantage of exposing them to the sun is, that every individual Apple sweats itself dry, which renders it fit for keeping for a length of time. Early on the second or third morning of exposure, they will be found to be bathed in sweat, and thus their acid qualities are expelled and their saccharine matter is concentrated. Of second or late sorts which show no symptoms of ripening on the tree, of course they cannot have the same advantage of the sun's rays as the summer varieties; when frost is expected they should be gathered, and, if possible, exposed in Melon-pits or frames in which air circulates freely; they should be treated as nearly like the others as the season will admit. The next thing to be considered is the storing of them, and this is of some importance. How creditable it is to have a good Ribston Pippin, for example, fit for table in April or May, instead of its being unfit for use in January, as is generally the case! My Apple-room was at one time fitted all round with racks; the bars of wood were two inches thick, with a space of one inch between them. The Apples were laid singly upon a layer of Wheat-straw, but I found that this did not answer; for when the door and window were shut, the fruit became covered with mould and damp; and if I gave air, they were sure to shrivel. I could find no medium between these evils until I had my room fitted upon its present plan. It has a northern aspect, and is covered with a good thickness of thatch. This answers better than slates, as it keeps the cold and frost out in winter, and also the heats in summer. Inside I have it fitted up all round with drawers 8 inches deep, 2 feet wide, and 2 feet long. They are made to fit tightly. Each drawer has the name of the fruit which it contains labelled on the outside. These drawers are half-filled with fine paper-shavings, and the fruit is carefully packed therein; or, in the absence of paper-shavings, I find clean Oat-chaff to answer equally well, each fruit being first wrapped in silk paper. By this method I can have good fruit during the greater part of the year.—*James Wilson.*

Water Wagtail.—The reading the remarks on the Water Wagtail last year, p. 392, revived in my memory a circumstance which occurred in my youth, that I shall probably never forget. The subject being again lately introduced, induces me now to offer the anecdote:—In the autumn of 1830, we had the house full of company. Being the eldest son, and occupying one of the best bedrooms, I was requested to turn out; I did so, and slept in a room in the roof. Some of my young friends were arranging an early start the following morning to shoot rabbits. With the bed-candle in my hand, on the point of retiring, I volunteered to join the party. I was laughed at and told they should be back again before I was up. I offered to bet them a shilling each I would be the first up. It was readily taken. About 5 o'clock I was awoke by a dactyl rap. I started, and thought it was quite up with my shillings, when I heard it repeated; and presently I perceived it was done by a Wagtail at the window. I felt somewhat easier for the fate of my shillings, which feeling was not decreased on opening the door, and hearing nothing but most sonorous sounds all through the gallery. I soon roused my friends, whom I rejoiced to find performing similar notes to the company's servants above. It was now my turn to laugh. The elegant little creature performed this kind office just before sunrise every morning during the fortnight I occupied the room. I generally took its gentle hint, astonished all the family, and almost established a character for early rising. Opening the window seemed to disappoint my little friend and pet very much, which led me to suppose he came purposely to admire himself in the glass. Your correspondent says, in his case this could not have been so, as there was no blind to the window; nor was there always in my case. Neither do I think a blind absolutely necessary to produce reflection; the interior of a house being darker than the exterior, the window-glass will generally reflect exterior objects as well, or even more perfectly, without it. I have inquired, but cannot learn that the bird visits any other window in the house. Servants, unless superstitious, seldom regard such a matter. My housekeeper, who has occupied this room for the last five years, says every year during the summer she is frequently awoke by a bird tapping at the window. It had not occurred for a month or more. She does not exactly know what bird it is, but thinks it is the Dishwasher, which I imagine must be the Water Wagtail, though probably not the same kind as your correspondent's "Boarula;" for his friend, I observe, visits him only during winter, whereas we have the yellow and another here all the year round. The former is larger, and I think a rather more graceful bird.—*B. Chilo., North Devon.*

Dog Rose.—Does the old name of Canker, or Canker-rose remain in use amongst the vulgar (the most enduring repositories of the vernacular), in any part of the kingdom? It must have been in familiar use in Shakspeare's day:—

D. John. I had rather be a Canker in a hedge, than a Rose in his grace.—*Much ado about Nothing.*

Hot. To put down Richard, that sweet lovely Rose,
And to plant this thorn, this Canker Bolingbroke.—*K. Hen. IV.*

And yet it is curious that Gerard does not mention it in his account of the plant; although it is, I suppose, erroneously introduced into his Index, thus—"Canker-rose, *i. e.* Poppy," for it is not to be found in his "History of the Poppy and his kinds." Gerard did not live in the country, properly speaking, and dealt more with Dioscorides and Theophrastus, Mathiolus and Lobelius, than with the wits of his time, and therefore probably never met with the country name of Canker. I am puzzled to know why it was called the Canker-rose. The commentators on Shakspeare quote a contemporaneous authority or two in illustration of the use of the word, but afford no other light on the subject. Johnson goes no farther than the definition. Booth, to whose "Analytical Dictionary," (1835), I often refer with great satisfaction, under the head Dog-rose, says it was called Canker-rose because of its hairy galls. This is not very satisfactory, and does not carry us near enough, I suspect, to the original appropriation of the term. Is there any authority for such a German compound as kanker-gallen, or gallapfelen—spider-gall? and has it been applied to the excrescence in question? If so, then one's mind is led to think of a Gothic or Celtic original for canker, cancer, *κάγχρυς*, sea and land spiders, and other rough things, and such like pleasant etymological reveries.—*P. P.*

Pelargoniums.—I am pleased to see that the beautiful Cape Pelargoniums are likely to come into fashion again. A favourite plant with me is P. echinatum. A few cuttings, struck at three times in the year, will keep up a succession actually all the year round. It strikes very freely under almost any circumstances, while in a growing state, and thrives in loam, peat, and white sand. My large plant has now fourteen trusses, and looks like a cloud of white butterflies with pink spots on their wings.—*Micklewell.*

Hints to Botanical Collectors.—Much unnecessary anxiety might be spared those to whose care newly introduced plants and seeds are consigned, if collectors would attach some memoranda to them, not only concerning the soil in which the plants delight, with some cursory remarks on their habit, which is, in many cases, all the directions given by which the cultivator is to be guided in their treatment, but also the climate, the degree of temperature at various periods of the year if possible, and above all, the situation in which they grow. When I speak of collectors, I do not refer to persons whose sole object in exploring distant regions, is collecting not only the productions of various climes, but also giving an account of their habits, &c.; I allude to persons who, by some cause either of business or pleasure, are induced to visit distant climes, and being for the most part entirely ignorant of botany and gardening, and, consequently, their knowledge of plants in general being limited, collect indiscriminately everything which comes in their way, thinking, because they had never previously seen them, they must be unknown in this country. In this way a host of rubbish is constantly being introduced, to be a trouble and anxiety for, perhaps, two or three years, and then to be cast away. But supposing that there should be one plant out of the many worthy of cultivation, how are we to be guided as to its treatment? Many a beautiful plant has undoubtedly died in its infancy solely from a want of proper treatment, arising from the above causes. The only guide which those collectors deign to give, is something after this manner:—"A beautiful blue flower from New Holland;" "Liliaceous plant;" "A shrub resembling a Symphoria;" and such-like vague descriptions, from which nothing of any importance relative to the proper treatment of the plant can be gathered. A plant may be a native of a very warm country, and yet, growing on elevated situations, would require a temperature very opposite to what would be supposed from the mere knowledge of its coming from such and such a country. Suppose two plants were brought from Mexico, one from the plains, the other from a mountain several thousand feet above the level of the sea, and the only guide to their cultivation given was, that they were natives of Mexico—the consequence would be, both would be subjected to the same treatment—probably a hot one; in which, while one may luxuriate, the other—it may be the more valuable specimen—would perish. In a word, gardeners in general should study the physical as well as geographical situation of plants, as a means of rendering their labours more easy, and as pointing out a shorter way to the attainment of the desired end, viz. successful cultivation. —*Walter Wakefield.*

Flower Gardens.—Will some of your correspondents point out the best method of ornamenting the flower-garden at this time of the year, with those beautiful plants, the improved varieties of the Pelargonium? I have one now in the open border, which was very hardly treated during the winter, and did not bloom [illegible]ring, which is blossoming as well as if it were in M[illegible]h's greenhouse. They will probably not la[illegible] blossom as the scarlets, but they would be [illegible] for a considerable time. They seem [illegible] and blossom, and blossom and [illegible] possibly be made the most b[illegible] by a little delaying manageme[illegible] deners attend so exclusively to [illegible] totally neglect the autumnal? I am [illegible] to think it is because of the London [illegible] should recollect that the same affluent peop[illegible] London in the spring, live in the country in au[illegible] are as vain of their gardens as peacocks of their [illegible] they happen to have them in tolerably showy orde[illegible]—*Autumnus.*

Monstrosities.—Why do Vines, Fuchsias, &c., put out roots frequently at their joints? Even Pelargoniums, in small pots and a feeding atmosphere do this, as do also Melons and Cucumbers, even with full scope for their roots. Potatoes show the same inclination; and the stem in some instances thickens, which growth certainly arises from the tuber not having a sufficient supply of moisture to induce it to throw out roots to increase its kind in the way natural to it; and, taking advantage of all its leaves can collect, and the parent tuber supply, what would be leaves and young side-shoots are converted into tubers. The should-be-eyes for the same purpose throw out small leaves, no stems, and again Potatoes (green Potatoes) instead of green leaves and stems are produced. Of this I had a beautiful exemplification last year on my Pansy border; the ground the previous year had been planted with Potatoes, (the Early American and Blue Laurel); some of these being left in the soil grew. The ground had been double-dug, in order to prepare it for the flowers, and the tubers were cast too deep to be got up without injury to several plants; the spot where they grew became the regular path, trodden and baked hard. The stems grew, as I have stated, and were borne down by the weight of tubers, which increased rapidly; I laid weeds, a few at a time, upon some of them; they thus lost a little of their deep green appearance. I then put a compost consisting chiefly of decayed leaves over the weeds, slightly earthing them; after a time some of these tubers protruded, that part acquiring the colour of all exposed Potatoes, that covered being white; the eyes of one part sunk, while the green had the vegetating appearance of the uncovered ones on the stems. The part I tried this upon was the middle of the stem, and I covered rather more than ½ of it. The stem retained its verdure much longer than the others, but from lying on the ground many of the tuberous excrescences were entirely eaten by snails. One plant that was dug for, had not one Potatoe at the root; the others were covered with straw and earth, and were to remain till spring; they were, however, lost or thrown away. I was anxious to see what they would do when cultivated this year.—*A. W.*

Wasps.—I am sorry to learn from "H. P." that he has not succeeded in destroying a wasp's nest by means of spirits of turpentine. It must be borne in mind that the nest of wasps is seldom perpendicularly under the entrance; the instinct of the animal, no doubt, directs a different arrangement, as a security against wet. I have found that after the wasps enter the hole, they proceed for a few inches in a line almost horizontal, and then take a more perpendicular route to the nest, which will be at some distance from the entrance. The bottle containing the spirits of turpentine is here of great value, because you can insert the neck in the direction of the horizontal passage, and then the turpentine will go direct to the nest; if these conditions are observed, and all air excluded by means of mud or clay round the top, it is impossible that the wasps inside can escape destruction. Although a small quantity of turpentine may be sufficient, yet as it is a cheap article I would recommend about a quarter of a pint for each operation.—*Jasper Stokes, Birmingham.*——Another correspondent, signing himself "A. K." says, "I tried the experiment of destroying wasps' nests by turpentine in a bottle, on two nests; in one which was not deep in the ground it completely succeeded; in the other, which was much deeper, it failed. My gardener then poured hot Stockholm tar into the hole, and this answered perfectly; all the wasps were destroyed. He has since destroyed another in the same way."—— *Rougham* remarks that "an easy, cheap, and effectual way of destroying a wasp's nest and the swarm is to pour a pint of gas-tar into the hole, or if the hole is large and placed inconveniently for pouring, stuff into it a wisp of straw dipped in gas-tar. No wasp can rush out to attack you, and every wasp which may be abroad will be caught and disabled on his return home."——Did

"H. D.," who complains that turpentine had not killed his wasps, (*ante* p. 621,) stop up both holes? as wasps have generally two entrances to their nest, and without both are closed the fumes of the turpentine could not of course act. I can speak to its complete success if properly attended to.—*D.*

Strawberries.—Respecting the cutting off the leaves of Strawberries, I beg to mention that in a border containing 45 beds of the following kinds, viz., Keen's Seedling, Downton, Roseberry, Wilmot's Superb, Pine, Hautboy, Myatt's Pine, Elton Seedling, Carolina, and Knevet's Seedling, after the fruit was gathered last autumn, I mowed the leaves off every second bed, and raked them off lightly, making straight the sides of the beds, and hoeing the alleys; I then threw the soil over the beds that had been loosened with the hoe; the other beds had nothing done to them except weeding when it was necessary. During this season there was no difference between the crop on the beds that had not been touched, and that on those which had had the leaves mowed off. I have had the management of Strawberries for nearly 60 years, and I have for the most part grown them in 4-feet beds, and, except near walks, I have treated them as above, and I have always fine crops of excellent fruit. As to manure, I never thought of it, except for Myatt's Pine; I always found my plants to grow quite strong enough, and even rather more so than I could have wished. On Strawberries grown in beds the fruit is always clean, which is not the case with that on single rows, besides, the small quantity of soil spread over the plants from the alleys, supports and strengthens them, as well as assists the young runners in striking root. I have always found the produce of the third year after planting the best. I am sure that the bed system of culture is the most suitable in every respect for market-gardeners: the produce is nearly double that of single-row culture. I have read the remarks at p. 555, 1843, which I consider excellent; but as I have always obtained good crops from my old method, I still continue to practise it.—*J. H.*

Cats and Valerian.—With regard to Valerian and cats, a correspondent signing himself "Autumnus," by way of suggestion, writes:—"Might not gamekeepers use bundles of Valerian to catch wild cats in the cover? Might not the owners of barns, outhouses, ships, and other places infested with rats, use the Valerian to assemble their enemies, and our friends the cats?"

Scorching Effects of the Sun.—In the *Chronicle* I have read, with some surprise, statements which I have thought resulted from want of observation, upon the spot on Vine leaves, &c. Nothing coincided with my practical observation except the paragraph by "Vidimus," p. 540, which I see, unfortunately for my own opinion, you do not encourage. You say, How do the lenses get into focus? Another question appears to me to answer this—Do not the drops of water shift and change their form, and run down the glass before they can act? It is not while the glass is covered with steam sufficient to form streams, and constant and frequent droppings of water, that the injury is done, for the course of these drops is devious; a larger drop of steam being added to the current, one hastens as well as directs it progress, and the leaves upon which these drops fall being still moist, the additional moisture readily spreads over a larger surface than it would do if they were dry, and a general evaporation and absorption takes place; the glass also dries by degrees; but large drops of water will hang upon it for a long time after the sun has dried the surrounding surface; these tremble, oscillate, sparkle like brilliant suns, sometimes drop, sometimes run, and, meeting at the next fold of the glass a little more moisture, or on the flat pane a dew-drop, there stop, either to oscillate into the focus to form a burning-glass under which the foliage suffers, or, the addition being too great, it runs forward and drops, or is evaporated at a fold, or stands till it can get through, performing its work of destruction. My observations were made upon a Melon-pit, 17 feet by 7 feet wide; and, as I was the sole worker of it, the spots and mildew or fungus proved an annoyance; and when I searched gardening books I was no wiser. Gardeners said, with great composure, "We all have the same complaint; there is no remedy but pulling off the spotted leaves; it may be a flaw in the glass, &c.;" and I was no better off, but resolved to have some idea of the truth. My pit was constructed with a flagged footway at the back, from which the centre could be reached; this I mounted to make my observations, and the result was as above. Then for the remedy. My frames were made so that I could let air or steam out at the upper part, without admitting a thorough draft by the entrance of air at the bottom; and by thus permitting my glasses to dry, I secured the plants from spot. In very hot weather I watered from 8 to 9 o'clock, A.M., and also while the sun was on the frame in the afternoon, and shut up early; when my fruit was setting and swelling, at 5 or 6 o'clock; and 4 in cloudy weather. I never failed having abundant crops of high-flavoured well-grown fruit. With the Persian Melon in pots in the same pit I was equally successful, neither spot nor spider showing themselves. In the same frame I have grown the Manchester Green Spine Cucumber 26 inches long, and had six, seven, and eight to cut at once of this size, while my Melons were setting and growing; but when the Cucumber Vines began to interfere with the Melons, I cut them up or cut them to one stem, and trained it along the bottom of the pit below where the Melons run. I worked my frame with what gardeners called a scalding heat, but I never had a twig hurt by it, and my pit was never filled till April, yet I could generally obtain two crops of fruit off the same roots.—*A. W.*

Destroying Worms.—In the Calendar of Operations of the 7th, "D. B." directs gardeners to look over all their plants in pots, in order to see if the drainage is right, and that there are no worms in them. This is attended with some disadvantage, especially if the plants have had large shifts, and have not had time to fill the pots with roots. Let persons be ever so careful in turning a plant out of the pot, they are sure to disengage the drainage. I have been much annoyed by worms getting into my cutting pots, and on turning over a compost heap, on which I had put a small quantity of gas-water, and finding that there was scarcely a worm to be seen, I took four gallons of gas-water and poured it over the bottom of a three-light box, which I was about to use for cuttings; over this I spread about four inches of sifted cinders, and the result has been equal to my expectations; not a worm has dared to come through as yet. The gas-water covered over to that depth has not affected the cuttings, neither is there the least disagreeable smell from it. On no account, however, use gas-water in any house, pit, or frame, without covering it over with some kind of material, or it is sure to destroy your plants. When I fill my tan-beds, I intend putting a quantity of gas-water all over the bark, about a foot below the surface, and also below all plants standing out of doors.—*A. Threlkeld, Headingly House.*

Bees.—As the questions put by "A Lover of Truth" (p. 572) appear to me not to be satisfactorily answered, I beg leave to say a few words on the subject. Dr. Bevan and others say that a queen-bee lays three sorts of eggs, and that she knows what sort of eggs she is going to lay. It is even stated that queens commence to lay drone-eggs at certain seasons of the year, and that the great laying takes place about the beginning of May. Last year I hinted that a queen lays only one sort of eggs, and this I still affirm. In March or April take a strong and a weak stock, containing equal quantities of drone-comb, occupying the same place in each hive; the strong one will commence to breed drones about four weeks sooner than the other. Exchanging the queens will make no difference. If one hive contain double the number of drone-cells, double the number of drones will be bred in it, even though the queens are exchanged. If we were to place a bit of drone-comb in the centre of the weak stock, where brood is just hatched, it would breed drones before the strong one. "A Lover of Truth" will now, I think, naturally and justly conclude that the season of drone-breeding, and the number of drones bred, do not depend on the laying or eggs of the queen, but on the situation and number of drone-cells in the hive, and that if the comb which he speaks of had consisted solely of worker-cells, there would perhaps not have been a single drone hatched in it. It would, however, be uncandid not to acknowledge that a pretty weighty objection can be brought against this assertion, viz., that the queen-bee lays only one sort of egg; but I imagine that this will not overturn it, and that those who dispute this point will find it difficult to maintain their assertions by fact and argument.—*A. Pettigrew.*

Cape Iridaceæ.—I have flowered a few of these for several years with uniform success. My simple means and directions are as follow:—Listen to no printed and reprinted stories about cold frames and south borders. The cold frame plan is uncertain at best; and as to the south borders, look at your Ixias after a thunder shower. The place for the delicate and lovely little things is the greenhouse, where their frail beauty will bloom unruffled, and will be, as it invariably is, the attraction of all eyes on entering the house. Purchase selected roots from a respectable seedsman every year; get them as soon in the season as you can, and pot them immediately in any of the prescribed composts, provided it be turfy, sandy, and peaty, and mixed with cow-dung.—*Micklewell.*

Sulphate of Iron.—Your Leading Article of some two or three weeks since, on this subject, has misled some men who pin their faith on your judgment. You stated it could not cost more than 4*l.* 4*s.*, but I find from my invoice that a ton costs 5*l.* 11*s.*; and one of the first manure merchants in London writes—"I am of opinion its general application or its cheapness cannot be put in competition with sulphuric acid."—*Suffolk.* [We repeat that sulphate of iron can be had of Mr. W. Northcott, 13, Rood-lane, Fenchurch-street, at from 3*l.* 15*s.* to 4*l.* 4*s.* a ton, according to the quantity taken. It is much more convenient to employ than sulphuric acid, as well as more useful; because it decomposes sulphuretted hydrogen, and removes bad smells, which sulphuric acid will not do.]

Societies.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.

Sept. 17.—This Exhibition, the last for the season, was held in the Surrey Zoological Gardens. The display of Dahlias, which always form the principal feature of the September Meeting, was not upon so extensive a scale as on former occasions. The Chelmsford Show having been appointed for the same day kept some of the usual exhibitors away; but the general appearance of the stands was good, and several of them excellent. The Silver Cup, value 5*l.* 5*s.* presented by the Committee, for the best 24 Dahlias, was awarded to Mr. Cook for Princess Royal, Perpetual Grand, Phenomenon, Prince of Wales, Mrs. Shelley, Model of Perfection, Widnall's Queen, Admiral Stopford, Competitor, Essex Triumph, Burnham Hero, Nonpareil, Standard of Perfection, Queen of Trumps, Victory of Sussex, Indispensable, Crimson Perfection, Beauty of Sussex, Hero of Stonehenge, Blue Bonnet, Lady Antrobus, Pet Rival, Favourite, and President of West.—Among *Amateurs* the 1st Prize was awarded to Lady Paget, Chelsea Hospital, for Burnham Hero, Widnall's Queen, Princess Royal, Sir Robert Sale, Mrs. Shelley, Admiral Stopford, Antagonist, Aurantia, Hodge's Competitor, and Dodd's Prince of Wales—Mr. Bushell, of Kennington, obtained a small Silver Medal for the following, viz., Emma, Hampstead Rival, Admiral Stopford, Widnall's Queen, Victory of Sussex, Lady St. Maur, Pickwick, Mrs. Shelley, Prince of Wales, Essex Triumph, Vivid, Great Mogul, Regina, Bianca, Pet Rival, Hudson's Princess Royal, Applause, Mara, Queen of Trumps, Aurantia, Nonpareil, Uxbridge Magnet, Beauty of Sussex, and Mrs. Hanley.—To other stands no names were attached. Several seedlings were exhibited, but none of first-rate quality. Several blooms of a very fine seedling Pansy, named *Pizarro*, was exhibited by Mr. Thompson, of Iver, to which a first class Certificate was awarded. This is a well-formed flower, of considerable substance, centre clear yellow, with good eye; the top petals are of a deep bronzy purple, with a broad margin of the same colour surrounding the lower petals; the side petals meet well above the eye, where the belting joins, making the shield of the ground colour complete; a rich and fine flower.—A very pretty variety of the Petunia was shown, named *Invincible*, having a light rosy-lilac ground, with dark throat, and a broad margin of rose colour on the margin of the corolla; if constant this will form a very good variety. Miscellaneous collections of plants were deficient. By far the best present was that sent by Mr. Bruce, gr. to B. Miller, Esq., who received a large Silver Medal for well-grown specimens of Achimenes longiflora, a large plant of Crowea saligna, in good health, but scarce of bloom; a neat specimen of Erica rupestris, a dwarf-growing species, having small white flowers, and a pretty dark-green foliage; together with Cliffortiana, covered with a profusion of slender white blossoms, delicately tinged with pink; and cruenta, a very useful autumn-flowering sort. Mr. Bruce also sent several species of Clerodendron, among which was a beautiful specimen of squamatum, having a fine head of scarlet flowers; an excellent plant of Erythrina Crista-galli, having eight stems loaded with bloom; a large Ixora coccinea, Justicia oblongata, and a plant of Pancratium fragrans, well managed, together with some others, in equally good condition.—A Middle Silver Medal was awarded to Mr. Hamp, gr. to J. Thorn, Esq., for a second group, comprising among others a small but healthy specimen of Gardoquia Hookeri; a good Crowea saligna; Achimenes grandiflora in good condition; and Portulaca splendens, producing beautiful purple flowers; together with a pretty plant of Angelonia salicariæfolia, and a specimen of Lilium lancifolium album.—In the Nurserymen's class the best collection was sent by Mr. Jennings, of South Lambeth; it consisted chiefly of Petunias and Fuchsias, among which was Exoniensis in fair condition, along with the different kinds of Achimenes, and some Roses.—Mr. Jennings also contributed a group of Fuchsias; the sorts were Exoniensis, Halley's King John, Eppsii, Epps's Bridgroom, and Kentish Bride; Smith's Paragon, Dalstonii, Stanwelliana, Brockmanii, Gem, Compacta, excelsa, and Iveryana.—The large Silver Medal offered for the best specimen plants of six distinct Genera, was awarded to Mr. Bruce, for a beautiful small plant of Erica Aitoniana, bearing a profusion of pretty white blossoms; Ixora grandiflora; a fine Clerodendron squamatum, and a plant of Pentas carnea in good condition; together with Russelia juncea, and a plant of Siphocampylus betulifolius. Mr. Bruce also showed, as a single specimen, a magnificent plant of Witsenia corymbosa.—G. T. Cox, Esq., of Stockwell, received a Middle Silver Medal, for plants of Angelonia salicariæfolia, Justicia oblongata, Gomphocarpus salicifolius, and a plant of the showy Aphelandra cristata.—Collections of Orchidaceæ were exhibited by Mr. Schroder and Mr. Cox. In Mr. Schroder's group, which was the best, we observed good specimens of Odontoglossum grande, and Stanhopea Wardii, the latter producing a fine spike of flowers; along with Cattleya intermedia, in fair condition. Mr. Cox sent, among others, the showy Cattleya Harrisoniæ, in a creditable state; Cymbidium giganteum, and a plant of Warrea tricolor.—Mr. Groom, of Clapham Rise, produced several small but handsome specimens of Lilium lancifolium rubrum or speciosum, which is one of the most beautiful of our autumn-flowering plants.—The large Silver Medal given by Mr. Groom to amateurs for the best specimen of either variety of Lilium lancifolium, was awarded to Mr. Schroder, for a plant of L. lancifolium album.—Among miscellaneous objects was a collection of well-bloomed Cockscombs, from Mr. Scorer; and another was contributed by Mr. Atterton, who also showed a group of Globe Amaranthus.—Mr. Jennings sent some dwarf Cacti; and Mr. Bridges obtained a middle Silver Medal for the best twelve Asters. The first prize for the best collection of cut flowers among amateurs was awarded to Mr. Davis; among gentlemen's gardeners to Mr. Bruce; and among nurserymen to Mr. Wood. Mr. Parsons obtained a middle Silver Medal for the best twelve bunches of cut Roses; and in the nurserymen's class Mr. Paul was awarded a middle Silver Medal for the same.—Of FRUIT and VEGETABLES some good samples were exhibited. Among gentlemen's gardeners Mr. Kay obtained a middle Silver Medal for the best four sorts of fruit; and Mr. Atterton was awarded the same for vegetables. Among nurserymen Mr. Bursill and Mr. Gaines were first. Mr. Parsons received a middle Silver Medal for good specimens of Black Hamburgh and Muscat of Alexandria Grapes; and fair bunches of Black Hamburgh Grapes were also shown by Mr. Chapman.

BOTANICAL SOCIETY OF LONDON.

Sept. 6.—J. Reynolds, Esq., Treasurer, in the Chair. Mr. T. Ingall presented a specimen of Teucrium Botrys found in a stony field at the back of Box Hill, between Brockham and the upper part of Headley Lane, Surrey, in August last.—Read, Dr. Taylor's description of some new Musci and Lichenes, from the Australian Colonies; namely, Dicranum Menziesii, Bryum leptothecium, Bartramia tenuis, Hypnum excavatum, Usnea scabrida, and Parmelia tubularis, all of Tayl. MSS.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

Sept. 5.—This was the Quarterly Meeting. Collections of fine Carnations, Flakes, Bizarres, and Picotees, were produced by Mr. Young and Mr. Thomson, but no competition being announced for this day, no award was made.—Specimens of a seedling Apricot, raised by Mr. J. Thomson, were tried, and found to be saccharine, juicy, and as high-flavoured as the Moorpark from the same wall, and considerably earlier, having been ripe more than a fortnight ago, and being now nearly past.—Various fruits from the Society's garden were also tried; particularly the Washington, Sharpe's Emperor, and Coul Orleans Plums; Moorpark, Breda, and Red Roman Apricots, with the Raisin Grape, which was considered hardy, having ripened its clusters in a cold greenhouse. Several very beautiful specimens of exotic plants, in full flower, from the hothouses in the Society's garden, ornamented the Hall; particularly Stanhopea insignis, and S. insignis speciosa; Miltonia spectabilis, having several flower-stems, and Clerodendron splendens.—The Secretary read a communication from Mr. J. Lothian, gr. to Mr. Campbell, on the use of Sea-weed as a manure. From the garden being situate on the shore of Loch Killis, ample opportunities are afforded for procuring sea-ware, and for trying its effects on various kinds of soil, and for different crops. Mr. Lothian's experience shows that it is best suited for very light or sandy soils, being of no advantage on heavy loams, and on clayey damp soils positively injurious. When trenched into a sandy soil, sea-ware was found to afford capital crops of Potatoes, Peas, Turnips, and Cabbages. The drift-ware (mixed with Sertulariæ, Flustræ, &c.,) when used as a winter covering for Asparagus and Artichoke beds, proved an excellent fertiliser. When sea-weed was dug in during autumn, between the Gooseberry and Raspberry lines, it was found very useful in destroying vermin, and promoting the vigour and fruitfulness of the bushes.—A number of new members were on this occasion added to the Society.

REGENT'S PARK GARDENERS' SOCIETY.

As a proof that Morphology is exciting considerable interest, a public meeting for its discussion has been held during the week, in the room used for the meetings of the Regent's Park Gardeners' Society. A rather protracted discussion took place, and many interesting specimens, illustrative of the subject, were exhibited. The chairman (Mr. Raith) made some remarks on the history of the science, and then read some paragraphs from Dr. Lindley's "Introduction to Botany," in explanation of it.—A person present then moved a resolution, to the effect that nothing had yet appeared in support of the monstrous doctrine, at all reconcileable with reason or common sense.—Mr. C. Moore observed, that a few months since he was prejudiced against it, but that he had since seen reason entirely to change his views, and had brought specimens to the meeting, for the purpose of proving that Morphology indeed rested on proofs. He produced a specimen of the viviparous variety of Aira cæspitosa, the panicle of which, instead of developing blossoms in the ordinary manner, had produced a quantity of buds, and these, on being spread over the surface of damp soil, had become rooted and established plants; in this case, the glumes never having expanded, he conceived the production of plants from the parts which should have perfected seed, as strong and incontrovertible evidence, that flowers and leaves are natural modifications of the same elementary organ. Allium scorodoprasum, with viviparous heads, was also produced. He strongly advised the dismissal of prejudice in considering such a subject, and a close examination of facts before a conclusion was arrived at.—The person above alluded to spoke in opposition, and endeavoured to explain the cause of plants becoming viviparous, by assuming that the internal parts of the flowers had been enabled to perform their functions, and produce seed, although they had not been visibly expanded; and that this seed had germinated whilst attached to the stem, and thus produced the young plants (!) With reference to the branches produced from the centre of some flowers, he contended that this was a monstrosity similar to what sometimes happens in the animal kingdom, such as a child born with two thumbs, or a lamb with two heads or tails (!) He denied that any of the parts of a plant or flower were not essential, having each a peculiar and allotted function to perform; and contended that God had made nothing in vain, but had formed all things perfect, and that nothing could border more strongly on atheism than this most dangerous and pernicious doctrine.—Mr. Maher, who had before him some beautiful morphological specimens, followed in vindication of the science. He said, that it was absurd to speak of the animal kingdom as furnishing any analogy with the subject in question, because, whilst the animal being (taking the perfect members as those only which were understood) was but one individual, or centre of vitality, the vegetable is composed of a numerous congeries of individuals, or distinct points of vitality, and therefore the monstrosities of the animal kingdom have no bearing on the question. He would indeed willingly allow that the Creator had made nothing in vain; but as a proof that this fact did not become opposed to Morphology, he cited numerous instances of plants which produce perfect seeds, and re-produce their species, and are yet wanting in some of the parts which are held to be essential, or even indispensable, by anti-morphologists: thus, the Oak, which produces perfect leaves and flowers of its own peculiar nature, is entirely devoid of the corolla, which is present in the majority of plants; and in the Salpiglossis, which, when fully developed, has a very handsome and conspicuous corolla; he had observed a seedling of which the flowers were devoid of a corolla, but had, nevertheless, borne seeds, and produced perfect plants. He entirely repudiated the charge of atheism, which was inapplicable to those who professed the doctrine; they being fully imbued with a sense of the Divine power, and even less atheistical than the florists, who had been and were busily engaged in perfecting the perfection of the Creator. The further discussion of the subject was postponed to the next meeting.—*M.*

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

INGA PULCHERR MA. Prettiest flowering Inga. (*Greenhouse Shrub*). Leguminosæ. Polygamia Monœcia.—In a genus of plants like the present, abounding in noble trees and handsome shrubs, airy and elegant in their foliage, and bedecked with speciosa inflorescence, the propriety of bestowing a name denoting superlative beauty upon any individual species may be somewhat questionable. Whatever of hyperbole there may appear, however, in that assigned to this plant, the beauty and loveliness of its characters entitle it to some corresponding epithet to distinguish it; and though there may be other species equally meriting admiration and distinction, these is none more worthy of ranking amongst the fairest ornaments of the tribe. One hundred and thirty-six species of Inga are enumerated by Don in his "System of Gardening and Botany," and it would appear from our catalogues, that fully one hundred of these have never yet graced a British collection. We may, therefore, hope that many, when introduced will prove useful acquisitions to the stove or the greenhouse. This plant flowered last February in the collection of Mr. Jackson, of Kingston, from whom healthy plants may be procured. Uniting with its superior ornamental qualities a propensity to disclose its beauties at a season when the general paucity of flower induces us to regard every fugitive blossom with a favourable eye, it is still more valuable. It bears a striking similarity in its general aspect to I. kermesina. It has, however, much smaller foliage, and the drooping tassel like blossoms, though scarcely equal in size, shine with a deeper and more lustrous hue. The irritability common to the leaves of many species of Mimosæ, and especially M. pudica and sensitiva, is also displayed, though to a less striking degree, in the plant under notice, particularly when grown in a warm stove. If the young leaves are pressed roughly by the hand, exposed to a strong current of air, or a sudden depression of temperature, they rapidly contract and fold together, but soon expand and raise themselves again to their usual position. When cultivated in the greenhouse the leaflets never expand, even in the brightest and warmest days throughout the whole course of the winter season. In its cultivation, the chief things to be thought of are the selection of a suitable medium for the roots, to provide a congenial atmosphere in the growing season, and afterwards conditions favourable to a suspension of vegetative activity. A light loam added to an equal proportion of peat and sand, enriched with well reduced leaf mould, may be used with propriety. A greenhouse temperature is decidedly most proper during the summer season, and till the autumn is far advanced. In winter it should be kept in the stove, where it may remain till May or June. It is stated to be a native of Mexico, in Loudon's "Hortus Britannicus," and introduced to this country in 1822. The generic title is a South American name adopted by Maregrave, a naturalist who wrote on the Natural History of Brazil, about the middle of the seventeenth century.—*Paxton's Magazine of Botany*

ODONTOGLOSSUM LÆVE. Smooth-lipped Odontoglossum (*Stove Epiphyte*) Orchidaceæ. Gynandria Monandria.—Both Mr. Skinner and Mr. Hartweg found this plant abundantly in Guatemala, and sent it home to their friends, so that it is by no means rare in collections. It is not, however, much esteemed, because of the plainness of colour in its flowers. Nevertheless, they have chocolate-brown blotches on the yellow ground of the petals and sepals; and the lip, which is white, is banded with violet across the middle; besides which, they are fragrant. The name Odontoglossum, or Tooth tongue, has been given to these plants because they are usually furnished with strong teeth on the lower part of the lip, and these teeth are not unfrequently very conspicuous. Here, however, they are reduced to a couple of trifling protuberances, and might be easily overlooked. This species should be potted in turfy peat, and placed in a moist stove. A liberal supply of water should be given during the growing season, and the house should be shaded in sunny weather, in order to keep the temperature as near 80° by day as possible. In winter, like many other bulbous Orchidaceous plants, it requires very little water for a few weeks, but would be much benefited (especially in clear weather) if the house in which it is grown could be filled with steam once a day. The temperature should at that time never be raised above 60° by fire-heat. *Botanical Register.*

Garden Memoranda.

Dalvey Gardens, near Forres.—On recently visiting these gardens, we were gratified by observing a number of rare and pretty plants in bloom, among which we particularly noticed in the new stove, a large plant of Zygopetalum Mackaii, bearing a number of spikes of flower; the delicately coloured Cattleya Harrisoniæ; the highly fragrant Stanhopea oculata, in fine flower; along with a large plant of Oncidium flexuosum; the butterfly plant, O. Papilio; the beautiful Saccolabium guttatum, producing its graceful raceme of flowers like a pendant feather; Vanda multiflora, with small yellow flowers barred with brown, and the deep yellow Dendrobium chrysanthum, marked in the centre with a dark velvety spot. The beauty of this house was much heightened by the different species of Achimenes. There was also in good bloom the beautiful, bright yellow-flowered Echites suberecta, and the exquisitely tinted Ipomœa Learii. In one of the houses we observed a large plant of Lilium punctatum album, with four flower-stalks, seven feet high, bearing nearly forty beautiful white flowers; a good L. punctatum with three stalks, six feet high, bearing upwards of a score of delicate tinted pink and white blossoms; and the scarce L. speciosum, with one stalk, four feet high, bearing nine exquisitely beautiful rose and white flowers. In this house there was also in bloom many of the new varieties of Fuchsia now in cultivation, some of which were covered with very large and showy flowers. The open grounds were ornamented with Dahlias, Holyhocks, &c., just coming into bloom, many of which are fine sorts.

Miscellaneous.

Mutual Indentation of Two Forest Trees.—Near the walk which leads to the flower-garden at Walton Hall, near Wakefield, may be seen an English Elm and a Scotch Fir growing in close embrace. They are now 15 feet in height, and 1 foot 10 inches in circumference at the base. By twisting the leading shoot of one tree annually round that of the other, the trees have become deeply embedded in each other's folds. The Elm being of stronger vegetation than the Spruce, I have taken the precaution of curtailing the lateral branches of the former, lest it should prove too much for its weaker partner.—*Waterton's Essays.*

Insect Revenge.—At Leintwardine, lately, a swarm of bees, which had been brushed off the mouth of the hive, where they had clustered, became so irritated, that they set upon everything in their way, and stung to death 26 chickens and young ducks. The old poultry got out of their road, or they probably would have shared the same fate. After sundry gyrations, and other onslaughts upon man and beast, the night approaching, they returned quietly to the hive.—*Scotsman.*

New sort of Tamarisk.—At Mudjèlibé, or Babel, part of ancient Babylon, there grows on the summit of ruins, which are supposed to have been the suspended gardens of Semiramis, a lonely tree of which all travellers speak. Some call it *cedar*, others say that it is a tree, the like of which is not to be found anywhere else; finally, a very ancient tree, perhaps, even as old as the time of Herodotus. This tree, according to dried specimens, gathered by Aucher, in 1835, is the Tamarix pycnocarpa. Other species of Tamarisk grow in those countries, among others, the Tamarix articulata, which is very common in Asia, as well as Tamarix gallica, which is found almost everywhere. This last species is not rare in the gardens of Europe, whilst the other two are not yet known there. —*Pépin, in Revue Horticole.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

STOVE PLANTS, and indeed all house-plants, have ripened better this season than they generally do, owing to the hot, clear weather, in the end of the spring and through the summer. This corresponds with the treatment generally recommended for some years past, which is—after vegetation has fairly begun in spring, to increase the temperature of the houses, and by way of genial forcing to assist nature. Plants thus treated, and stove plants in particular, cannot be too cautiously watered late in the autumn. Nothing is now wanted, but to keep the soil from getting quite dry. In dull or rainy weather slight fires should be made in the forenoon, not so much for the purpose of raising the temperature, as for drying the house. Allow a little ventilation, as stoves generally are too much crowded, and so damp that, more or less, air is always necessary to maintain a healthy atmosphere.

Conservatory.—On the contrary, everything in the conservatory should be clean and sweet; the plants should never be crowded, therefore little air is wanted through the ventilators while the plants are at rest, indeed, letting in strong currents of air after this time does a good deal of mischief, by drying the soil in the pots too much, and thus rendering large doses of water necessary when none at all is wanted. Plants in sitting-rooms now require a very different treatment; housemaids will ventilate their rooms as long and as often as they can, and make large fires in cold weather, very much to the injury of plants, which must have water freely every day, and should be charged as often as the stock will permit.

Pits and Frames.—By the middle of September Violets should be planted out in pits, within a few inches of the glass; after they are well watered lay half an inch of very dry soil over the surface, in order to keep down the damp until the plants are firmly established and inured to confinement. Pots of Marguerite must also be protected from rain; but they should not be kept close. Heliotropes often get too strong about this time, if they are in the open air; when this happens they never flower so freely in winter, a short allowance of water with some covering will soon check them. China Roses of all classes that have been close pruned in August should now be encouraged in pits, and they will soon begin to bloom. Dwarf Nemums that have been hard forced to make young wood after flowering should be hardened to stand over the winter in cold pits, merely keeping the frost from them.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

Where extensive alterations and improvements in pleasure-grounds are contemplated, the sooner they are proceeded with after this time the better. There are many advantages in commencing early: first, much more work can be done in a given time, now that the ground is in a workable condition, than it is possible to perform after the rains of winter have set in, and not only can much more be done, but it can be performed in a much more satisfactory manner, secondly, by commencing early we have the choice of the nurseries for such plants as are required, and there is a better chance of the transplanted shrubs succeeding, because, if the autumn is mild, they will strike root at once, and if it is not mild they will get so firmly fixed in the ground as to receive little injury, thirdly, new ground work should always, if possible, be got over before Christmas, and all planting should be completed by the middle or end of November. Choice Evergreens, especially if removed from nursery-beds, I prefer transplanting in April, as I have always found them succeed better than when removed in the autumn. Since April last I have removed hundreds of both evergreens and deciduous shrubs and trees, some of them from 10 to 20 feet high, and in full leaf; and dry as the season has been I have not on an average lost more than one in a hundred. The last, and perhaps greatest advantage of autumn planting is, that it sets the gardener's hand at liberty for spring work, which, if anything like high keeping is desired in the grounds, is essentially necessary.

Pits and Frames.—In about another fortnight the season for propagating will be gone by; therefore, where sufficient stock is not already got in, there is little time to lose. Plants that are standing out to be hardened should be so arranged as to be readily covered in case of frost, which may now be expected; and choice plants in beds which it is intended to take up and pot, should also be protected on cold nights.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Tulips.—Seed may now be sown in shallow pans or boxes, covering it very slightly. Continue to make additions to your collection, always preferring quality to quantity. Many fine

varieties are broke in different parts of the country, from seedling breeders, which will drive many old sorts from the amateur's best bed. *Carnations.*—Now is a most excellent time to take off and pot layers: if wireworms are in your compost, and your layers are destroyed, who will be to blame, after the repeated warnings given, to look well to it yourself? There is nothing like the grower's eye to detect these mischievous depredators. *Dahlias.*—Cuttings of anything very choice may be struck in a very gentle heat; they will form excellent pot roots for spring. *Pinks.*—Do not delay another week the formation of your beds for next season's exhibition. As we have before observed, very much depends on autumnal planting. *Auriculas.*—Keep these from the heavy autumnal rains, but by all means let them have all the air possible. *Polyanthuses*—May be removed with safety, but the sooner the better.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—More attention, if possible, will be required from this time in regulating the temperature of the Pine pits, as the necessity for using artificial heat increases. Keep the plants in fruit at 68° by night, and give a portion, however small, of fresh air every day, if at all practicable. Syringe the plants occasionally with water at 80°, and look frequently to the state of the soil, as regards moisture. The successions need not be kept higher than 65° on chilly nights. Great attention must be paid to renewing the linings when necessary of pits heated by dung. Those pits answer best which have a hot-water pipe carried round them, to dry up damp and raise the day temperature in cloudy weather, so as to admit of a portion of air being given every day, to sweeten the atmosphere and refresh the plants. There is no doubt that dung-heat is the best for growing Pines; but without the assistance of fire the plants sometimes unavoidably experience changes of temperature not favourable to them. Where there is not the convenience of a small boiler to such pits, now is a good time to supply the deficiency.

Vineries.—Do not defer the pruning of Vines intended for early forcing too long, or they will bleed when cut. Vines that ripened their fruit in April last will now break readily with but very slight encouragement. Some old Vines here, which I intend doing away with, are now swelling their buds fast, although they have all the air which it is possible to give them. I will now encourage them to break, and I have no doubt that some very early Grapes may be obtained, as the fruit will be set before the power of the sun has got to its lowest. After the crop is cut, there will be ample time for the young Vines planted in their place to make a good season's growth. I do not, however, recommend commencing to force at this early season, except in similar cases to the above, for it is ruinous to good Vines to excite them to growth at this season. Continue to carry on any alterations or repairs in the Vineries, while the season is favourable.

Peaches.—I again recommend losing no time in forwarding whatever work requires doing in the early house, and particularly in planting fresh trees in the place of any that may be worn out. Make choice of trees for this purpose that are in a bearing state, and that have been moved last autumn. These will certainly bear fruit the first season if taken up now. Peaches and Nectarines planted now in fresh soil, will go on making new roots nearly all the winter. In pruning the trees that have lost their leaves, be careful not to leave them too much crowded; but if the summer pruning has been properly done, but very little indeed will be required now. The Noblesse Peach should not have its young wood shortened or much thinned till after the fruit is set, as it is liable to break badly, and many of the fruit-buds drop off. By leaving the whole of the young wood till the fruit is set, a more regular crop will be insured as well as a better choice of young shoots for filling up the tree. Peach-trees in pots should now be pruned and top-dressed.

Cherry House.—The directions for the Peach-house will also apply to this, except that in planting fresh trees the soil should be of a somewhat lighter nature than for Peach trees.

Strawberries.—If the recently-potted plants have not been removed from the shady situation they were placed in after being potted, it should no longer be deferred, as they require all the sun possible now, as well as a free air to prevent the foliage becoming drawn, and to mature the plants.

Melons.—The weather has been unfavourable for ripening the late Melons, and they must be assisted by having a good top and bottom-heat, and a considerable portion of air in the middle of each day, or the fruit will be worthless.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Strawberry-beds.—Notwithstanding the repeated observations in the *Chronicle* respecting the impropriety of cutting off the leaves, upon the proper development and full exposure of which the maturation of the buds for next season depend, the practice is still extensively adopted; and it is no unusual thing to meet with individuals who proudly contrast the neat appearance of their beds with the somewhat rough aspect of those where the runners have only been removed, the smallest buds singled out, and full exposure given to those remaining. The treatment of Strawberries, as of everything else, should be varied according to circumstances and the object aimed at. The mowing off the leaves will succeed better in light soils, and in warm situations, than it will do on cold, stiff soils, as in the first case the mowing will be earlier performed, and a succession of healthy leaves will be produced, but produced at the expense of the stored-up nourishment existing in the bud. It may also be adopted in those cases where the unworkmanlike practice exists of depending chiefly on the runners of the present season. It is true that abundance of Strawberries may be procured by such a system, but the results of my practice and observation would say, that such fruit is not for a moment to be compared, either in quantity or quality, to that produced by the plants, where their leaves are left unmutilated. Besides, this system of cutting off the leaves renders the plants very susceptible of injury from the first keen frosts. The space between the rows may now be slightly forked, and a little manure put on the first opportunity.

Cauliflower.—Those who prefer August to September for sowing this, may now be getting it planted; where it is to receive the protection of hand-lights they should not be put on until indispensably necessary, as this will prevent much trouble afterwards. The rains we have had will save watering all the newly-planted vegetables, and has afforded an opportunity for tying mats, making tallies, looking after seeds, and putting all the rooms and sheds in good order. If fine weather succeeds, it will be very serviceable to late *Peas* and *Beans*, but if the former are so sown that little rain can reach the roots, they may still require artificial watering, as if the surface is kept moist by rains, and the roots are still in a dry condition, it is very favourable to the production of mildew. All the rain which we have had has wet the ground very little as yet.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—These, from the varying tints of the decaying foliage, now present a beautiful appearance. Look over them, take out some trees in order to make room for others, or plant trees of different kinds in order to improve or beautify the scenery by the diversity of colour; prepare for the thinning and planting season, which is at hand.

Coppice.—Fill up any vacancies with the same, or more valuable "stuff," clear away all that is useless, and trench, hole, and drain the ground where it requires it.

Young Plantations.—Frequently contemplate what should be done in this department before the thinning and planting season arrive. In thinning, whether indiscriminately, as is the too prevailing custom, or in groups or masses, keep each kind by themselves. I would strongly, for various reasons, advocate the grouping system; and in all new plantations let what are designed to become permanent trees be planted in groups, each sort by themselves, intermixed with nurses, some to be taken out and others to be kept low or headed off at certain heights for forming permanent undercover; the Beech, Hornbeam, Silver and Spruce Firs, are excellent for this purpose, particularly in Larch plantations.

Hedge Rows.—Refer to the two last Numbers of the *Chronicle*.

Nursery Work.—Follow the directions in the last week's Calendar.—*W. B.*

VII.—COTTAGERS' GARDENS.

Although the beauty of the garden may now begin to decline, do not cease to keep it equally neat and clean as before, but even more so, if possible. Leisure hours cannot be better spent than in attending to the little plot which, owing to the late favourable weather, still maintains a tolerably gay appearance. Dahlias, which are still blooming well, should have great attention bestowed upon them. Allow no decaying flowers to remain, and keep them neatly tied; clear away the haulm and decayed stems of such vegetables as are no longer useful to the manure heap, and prepare the ground for other crops. If a sowing of Cauliflower has not already been made, no time should be lost in getting a few seeds put in. Choose the bottom of a south wall for the purpose, where they will probably stand the winter with scarcely any protection. A small sowing of Lettuce may also now be made on a warm border. Keep Strawberry beds free from weeds and runners. If fresh plantations are wanted, they may still be made. Keen's Seedling and the British Queen are the two most profitable Strawberries for a cottager. Those who grow Tomatoes must keep them free from all useless growths; stop them well back, in order to expose the fruit, which is excellent this season, as much to the sun as possible. Be content with an ordinary crop rather than allow the plants to run too far in hopes of obtaining a very large one, which, being late, will not ripen well. Attend to fruit-gathering; on dry days it is better to gather it a little under-ripe, than to allow it to hang on the trees until it is quite ripe, as in that case wasps, which in some parts of the country are exceedingly troublesome, will have a large share of it. For methods of destroying them see another column of to-day's Paper.—*J. M'H.*

State of the Weather near London for the week ending Sept 19, 1844, as observed at the Horticultural Garden, Chiswick.

Sept.		Moon's Age.	Barometer. Max.	Barometer. Min.	Thermometer. Max.	Thermometer. Min.	Thermometer. Mean.	Wind.	Rain.

The highest temperature during the above period occurred on the 25th, 1832—therm. 82°; and the lowest on the 27th, 1828—therm. 24°.

Notices to Correspondents.

*** In consequence of the Editor's absence from London, he has to crave the indulgence of a few correspondents, particularly *Micklewell, E. G. L., A Lady, G. L. C. F., A Regular Subscriber. Nemo, an Old Subscriber, D. O., A. B., A. M., A. W., G. B., William*, until next week.

Blight.—*Rus.*—That which has attacked your Scarlet Runners is doubtless the red spider, for which no complete remedy is yet known.‖

Cardoons.—*J. F. S.*—Your Cardoons have been too early sown. The leaf-stalk is the part used.‖

Celery.—*Inquirer.*—Some earth up Celery by degrees, commencing early; others allow it to grow large, and then at once earth it up, and by so doing the plant acquires greater bulk. The stalks, however, are more tender when their lower parts are gradually covered; but a good portion of top should be left clear till the approach of severe weather, as regards the main winter crop; that for early use, of course, should be fully earthed up a fortnight previously to its being taken up.‖

Clubbing.—*Rus.*—The disease called clubbing certainly originates in the soil; but the grub which causes it sometimes attacks the plants whilst in the seed-bed. Doubtless brick-ash, burned earth, or burned turf, would prove beneficial, as you have experienced it to be. Marl is an excellent application, perhaps the best of any for old garden soil in which the Cabbage tribe is affected with the disease in question.‖

Fig-trees.—*Inquirer.*—*Juba.*—All that your Fig-trees require at present is protection from the early frosts, even if these should be but slight. The foliage of the Fig ought never to be killed by frost; for if this is allowed to take place, then the extremities of the shoots, on which the embryo Figs are situated—all that could be depended on for perfecting fruit in the following season—likewise perish. It is better not to remove the half grown Figs; they will soon die without wounding the trees.‖

Growing Letters.—*X.*—Excuse us. We do not believe the story. That imagination may *fancy* letters on a Calceolaria flower is possible; but that they should be as plain as if painted is rather too incredible.

Heating.—*Nessicus.*—If you are far north would not the Polmaise plan be worth consideration, combined with a tank for propagation? At all events you must have hot-water pipes for air-heat, as well as a tank for bottom-heat.——*A Young Gardener.*—We have not a word to say in favour of your plan. Why on earth go back to flues? And how do you think you will clean those which are placed under your bed? This scheme has been tried, and always proved a failure. Flues are very bad things in themselves, and detestable as a means of bottom-heating. If you do employ them never expect to see any Pines above six ounces.

Insects.—*A Far-North Man.*—Thanks for the specimens; they are the larvæ of the Lophyrus rufus, allied to L. pini, figured and described in Curtis's Brit. Ent. pl. 54. As they feed generally on the leaves, they seldom do any serious mischief, I believe, in this country, and probably will not make their appearance next year. *R.*——*H. D.*—We must request you to send Mr. Curtis a twig of an Erica with the scales upon it, as your quill contained only a little earth. We fear, however, that you will not be able to extirpate them. *R.*——*W. Joss.*—Many thanks for your pupæ, which we hope to rear, and will then discuss the economy of the Lophyri. *R.*——*Ebenezar.*—Your insect is the male Stag Beetle, Lucanus Cervus, which is supposed to wound trees and feed upon the sap; vide Curtis's Brit. Ent., fol. and pl. 490. *R.*—— *W. H. H.*—We must refer you to our Entomological article of last week, where you will find the grubs destroying the Cabbage-plants described and figured under the name of Noctua exclamationis. *R.*——*x. x. σ.*—The Weevils, for which we are much obliged, appear to be the Apion flavipemoratum. *R.*

Names of Fruits.—*A. A.*—1 and 3, Bellegarde, probably 2, Late Admirable. The Plum, No. 4, which you obtained from Italy, resembles the Quetsche, or German Prune, and was received from the Bolwiller Nursery, under the name of Quetsche d'Italie.‖——*O. P. Q.*—1, Wormsley Pippin, 2, Mank's Codlin; 3, Stone Pippin; 4, Pearson's Plate; 5, Beauty of Kent; 6, Alfriston; 7, Brabant Bellefleur; 8, King of the Pippins; 9, Hollow-crowned Pippin; 10, Blenheim Pippin. Pears: 11, Doyenné Blanc; 12, Passe Colmar; 13, Monstrous Egg. Peaches: 14, 15, and 16, Royal George.——*F. G. H.*—1, Russet Nonpareil; 2, Downton; 3, Spice. Pear, No. 1, Hampden's Bergamot.‖——*Amygdalus.*—1, Appears to be the Bellegarde; 2, Old Newington; 3, Late Admirable. It is almost impossible to distinguish some varieties of Peaches, especially after bearing carriage, without the leaves and size of the flowers.‖——*A Subscriber.*—1, Grange Pippin; 2, King of the Pippins; 4, Monstrous Leadington; 6, Gray Leadington; 7, Dumelow's Seedling; 8, White Impératrice Plum; 9, A sort of white Damson.‖——*T. Davidson.*—Your seedling Plum, small, purple, with a Damson flavour, can be proper only for kitchen use.‖——*R. Headly.*—Your seedling Nectarine is as good as a Newington, and is, like the latter, a clingstone; but such are not now in estimation.

Names of Plants.—*G. H. B.*—Goodenia ovata.§——*S. Lee.*—1. Centaurea Cyanus; 2. Medicago sativa; 3. Lychnis dioica, 4. Malva rotundifolia; 5. Arenaria rubra.§——*H. D.*—Not an Epacris, but a Callistemon of some sort, which, without a flower, cannot be named.§——*G. S. Gibson.*—Not Galium spurium, but G. tricorne, abundant in some parts of the country.§——*W. G.*—Campanula patula.§——*A Subscriber.*—Crassula tricuspidata and coccinea.§——*Emma.*—Zinnia violacea.—— *W. C.*—Hippeastrum reticulatum.—— *Tavern.*—Certainly not. Caprifolium etruscum is perfectly smooth.——*B. T. S.*—Your plant, not being in flower, cannot be named with certainty. It looks like Adiantum cirrhosa.——*T. B.*—Apios tuberosa.——*F. H.*—1. Stigmaphyllon aristatum; 2. Triopteris jamaicensis.

Pomegranates.—*Ryde.*—The late growth of your plants will no doubt render them more susceptible of cold than they would have been otherwise. It is therefore necessary that they should be more carefully guarded from hard frost when it comes. It will also be as well to shorten back, next March, all the branches which have burst into twigs; there is no fear of their dying. When they have lost their leaves we should transfer them from their old tubs to the new ones, and take the opportunity of renewing their soil, where it is loose, with fresh loam, such as would suit a Peach-border. In order to secure bloom hereafter they must be kept, while growing, in the hottest and most sunny place in the garden; if in front of a south wall so much the better. The flowers hitherto produced were prepared in the hot summer of Paris, and until similar effects shall have been produced on the trees by similar weather, no abundance of flowers can, we fear, be expected.

Potatoes.—*A Subscriber.*—Your Potato is the Purple Kidney, an excellent late variety.‖

Red Spider.—*A Subscriber.*—There is no plan of destroying this pest except by means of sulphur. The best way of applying it is to heat your flues or hot-water pipes, and then, while they are quite hot, to wash them with lime and flowers of sulphur. We fear the white worms you speak of are the grubs of some insect; and if so your soil must all be changed or burnt.

Roses.—*Green.*—What is to be gained by budding Roses on evergreen stocks? That will not make the former evergreen. If you want evergreen Roses you must trust to the China Rose and its allies.——*Octavia.*—If your Roses are transplanted carefully they will take no harm. Shorten the branches after they are removed. We have not made up our minds about reprinting the "Rose Garden." Do not allow this year's buds to bloom this year.

Underwood.—*L. Q. Z.*—The following ornamental evergreen and deciduous plants may be recommended for planting under trees:—Common and variegated Holly, Aucuba japonica, Laurustinus, Berberis Aquifolium, Viburnum opulus and oxycoccus, Ribes sanguineum, Cornus sanguinea, Leycesteria formosa, common and Portugal Laurels.‡

Vines.—*W. C.*—The circumstance of your Vine-roots being 2½ feet below the surface, and in cold, stiff soil, partly accounts for the berries neither swelling off nor colouring. The great slope of the border has probably occasioned it to be too dry in summer; for borders are generally too wet and cold for the roots of the Vine in winter, and allowed to be too dry in summer. You had better make a fresh border with rich turfy soil, using the surface of the old, which you say has lately been made good, for mixing with the turf and other materials proper to be introduced. Young Vines certainly; those that are 30 years old could not be replanted with advantage.

Miscellaneous.—*A. W.*—We would willingly repeat incessantly answers to questions continually asked; but where are we to find room for them? It surely is not asking too much of our readers to consult a few indexes for information which has been very often given. In the particular instance to which you refer we could not repeat the recommendation, the having given it at all being contrary to our rule, and only forced upon us by indispensable necessity. It is very possible that we may be sometimes imposed upon. Who is not? But we are not aware of any recent instance. Do not suppose that we are always ignorant of the authors of facts, which are only signed for the public eye with the initials of the writers. We are much obliged for your good wishes. Our opinion about guano is exactly the same as your own.——*A Subscriber* is answered in another column.‡——*D. W.* will find a select list of greenhouse climbers given at p. 392 of the present year.‡——*A Lady.*—We are unacquainted with any Fig with such a name as the Dough Fig or the Velasca. Very little is known in this country about this kind of fruit. Lindleya grafts readily on the Whitethorn, and will, in all probability, prove quite hardy in South Devon.——*Thomas Hughes.*—See a Leading Article to-day.——*J. W.*—Write to the keeper of the Bazaar. We have no other information than the advertisement.

SEEDLING FLOWERS.

Dahlias.—*W. H. S.*—Your seedling wants fullness in the centre, and the flower altogether wants depth.*

Fuchsias.—*J. P.*—Your seedlings are large, stout, and fine flowers; but the market is stocked with varieties from which it would be impossible to distinguish your specimens; the dark varieties are of no use. Picta, the light variety, is a good flower and worth keeping.*

Lophospermums.—*Joseph Fryer.*—Your seedling is curiously mottled, but it wants brightness of colour; it will always have a faded appearance.§

Pansies.—*F. T. G.*—Your seedling is a flower of good size and substance; top petals deep purple, with a narrow margin of yellow; the lower petals yellow, with good eye.*

Pelargoniums.—*L. L.*—Your seedling is a well formed and very good flower; it, however, bears too strong a resemblance to an excellent variety in cultivation named Hodge's Oberon.*——*J. R.*—Both your flowers are rather deficient in form. No. 1, which is fine in colour, has the lower petals too long and narrow, and the divisions between are large; in colour, texture, and substance, the flower is of a superior order. No. 2 has richly-coloured top petals, but altogether the flower is rather coarse, the centre somewhat discoloured, and surface of the petals veiny.*

Erratum.—At p. 606, article *Potter's Guano*, instead of "one-fifth guano and four-fifths *night*-soil," read "one-fifth guano and four-fifths *light*-soil."

TO LANDOWNERS, AGRICULTURISTS, BUILDERS, &c.

McKIBBIN'S Improved ROOFING FELT is peculiarly applicable as a substitute for Slate, Zinc, Tiles, and other articles used for Roofing, from its ECONOMY, LIGHTNESS, and DURABILITY.

The disadvantages attending other materials used in roofing, preventing, in agricultural districts, many useful houses and sheds being erected or rendered waterproof, it is submitted that the improved Roofing Felt will in a great measure—and in some instances altogether—obviate them, and prove most serviceable from its lightness, durability, and impermeability to water and damp, in covering Houses, Cattle-sheds, Workshops, Ropewalks, &c., and for the sides, as well as roofs, of light structures for plants, being likewise a non-conductor of heat; besides its economy in repairs, the timber where it is used may be so light as to save its whole expense; it requires no other coping, and may be applied by any person of common ingenuity; being flexible and portable also, it is free from breakage, the expense of carriage is inconsiderable in comparison with slates, tiles, &c., and it is not liable to contraction like zinc.

Sold in sheets 32 inches by 20, at 5*d.* each (being less than 9*s.* 6*d.* per square of 100 feet), with directions for applying them.

Orders will meet with prompt attention if addressed to H. C. BOWDEN, 18, East India Chambers, Leadenhall-street, London, or to the following agents:—Liverpool, Messrs. Grueber & Co., 11, Manesty-lane; Plymouth, Thomas Stevens, Esq.; Birmingham, William R. Loyd, Esq.; Sunderland and Newcastle-on-Tyne, Messrs. John Ritson and Sons; Hull, William Ward, Esq.; Bristol, Messrs. Moor and Hewitts; Ramsgate and Deal, Messrs. Edward Hodges & Co.; Whitehaven, William Todd, Esq.; Glasgow, Malcolm Carmichael, Esq., St. Enoch-square; Cork, Messrs. Richard Wallis & Co.; Belfast, Messrs. Grueber & Co., Dunbar's Dock; who have also on sale McKIBBIN'S improved SHEATHING, BOILER, RAILWAY, and other FELT.

*** The "IMPROVED ROOFING FELT" will be found much more durable than the Common Felt made in lengths, and not subject, like it or continuous sheets of other material, to be stripped by storm; it can also be more easily repaired, and from the simple mode of application recommended, the wet can not percolate through nail-holes, being only fastened down at the overlaps.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c. by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & C. have also to state that at the request of numerous friends they are now making their Boilers of Iron as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & Co. beg to inform the Trade that at their Manufactory in New Park st., every article required for the construction of Horticultural buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field, and Garden Fences, Wire Work, &c. &c.

The Agricultural Gazette.

SATURDAY, SEPTEMBER 21, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, Sept. 26 Agricultural Imp. Soc. of Ireland.
WEDNESDAY, Oct. 2 Flax Imp. Society of Ireland.
THURSDAY, Oct. 3 Agricultural Imp Soc. of Ireland.

FARMERS' CLUBS.

Sept. 23—West Hereford, W. Firle, Fairford, W. Market, Yoxford.

Sept. 26—Richmondshire.
Sept. 27—Halesworth, Hadleigh.
Sept. 30—Chepstow.
Oct. 2—Harleston.
Oct. 5—Collumpton, Abergavenny.

A DESCRIPTION OF THE IMPLEMENTS OF CULTIVATION cannot be better prefaced than by an article on those employed in drainage, for this process lies at the foundation of all good—*i. e.*, *economical* Agriculture. Opportunities will hereafter occur of referring to the draining-plough, the mole-plough, and other smaller tools required in draining: the first is rarely useful, except on the most homogeneous clays; the second is used to a considerable extent on pasture lands—by means of it a very imperfect, and by no means permanent description of drainage is effected; and the others are not individually of sufficient importance to justify the occupation of space here by further allusion to them. Our present object is to describe THE SUBSOIL PLOUGH, which is, strictly speaking, a drainage implement.

Land cannot with benefit be rendered loose, to any considerable depth, if it be wet. The subsoil-plough is not useful to the farmer of wet soils; his land must be dry, artificially or naturally, before this implement can be beneficially used by him. We do not wish our readers to depend on a mere assertion of this; but, without defending the statement at any length, it appears sufficiently obvious, that to deepen a wet soil would be to render it almost uncultivable by horse-labour—for draught animals require a firm footing, and this, in wet districts, it will be found, is always preserved for them by the shallow cultivation which experience teaches such lands should receive. And it is not unlikely that the practice of subsoil-ploughing, (or stirring, as it might more properly be called,) which, we find, from some of the County Reports to the Board of Agriculture,* prevailed half a century ago, has died away in those districts where once it existed, because it was unconnected with any efficient system of drainage. It was not till Mr. Smith showed, on his farm at Deanston, the great advantages following the adoption of both these operations together, that either of them obtained that high place in the practice of good farming which they now hold.

MR. SMITH'S SUBSOIL PLOUGH.

Mr. Smith's subsoil-plough consists of the ordinary framework of a plough, without the mould-board, made strong enough to stand the shocks and the strain to which an implement requiring the force of four or six horses to work it must be subjected. This framework is about 15 feet long. A sole-plate, on which a feather-shaped or pointed sock slips, is attached to it by means of two uprights and a curved coulter. The height of the plough, when held in a working position, from the sole-plate to the beam, is about 22 inches. It is thus enabled to go to a depth of 20 inches. From the furrow side of the sock a spur projects, over which the mass of subsoil cut by the coulter and share is raised and broken, and falls down again. By the action of this spur, and of the whole implement, the subsoil is effectually stirred, without any of it being lifted to the surface. The effect of subsequent deep ploughing, after the action of the air has thus sufficiently meliorated the subsoil, will be beneficial, while without this previous cultivation it would have been injurious. The subsoil-plough requires at least four horses to work it efficiently. The draught in a rather clayey soil was 11½ cwt., going from 16 to 18 inches deep. The draught of the common plough, which preceded it, and turned out the furrow in which it worked, was about 5 cwt., so that the work for the horses was about the same in either case. It is found that the wider the furrow is turned out, the more efficient is the operation. In a subsoil ploughing-match, held at Stirling in 1840, it was found that the best work was done by that subsoil-plough which was preceded by the old Scotch plough, which casts a very wide furrow. It is evident that this does not necessarily imply that the subsoil-plough shall pass along a fewer number of furrows in a given width of land than where the furrow is narrower, for the width of the furrow depends not on that of the furrow-slice, but on the width of the plough, which thrusts the furrow-slice from the fast-land. The expense of the operation of subsoil-ploughing is considerable, varying from 24*s.* to 30*s.* per acre, according to the nature of the land; and it is evident that in rough strong land, where the pickaxe is afterwards required to remove the obstructions which the plough has met with, the expense will be much greater than this. This is a statement of the debit side of the farmer's account of subsoil-ploughing. To find its credit side, he must compare his land as it was—wet or scorched, according to the weather, on which it was wholly dependent—with his land as it now is after the operation, free and friable, dry and open; and he must take the crop he raises now at less expense, too, than formerly; for the land, being drier, is more easily tilled; and he must compare this crop with that he used to raise on the same land. The difference will generally yield a large per centage on the capital he has laid out; the experience of Mr. Brodie, of Abbey Mains, East Lothian, on this subject, is given by Mr. Sullivan in another column of this Paper.

Since the construction of the Deanston subsoil-plough, one of a lighter form, made of wood, has been invented by Sir Edward Stracey, of Rackheath.

RACKHEATH SUBSOIL PLOUGH.

It is used just as Mr. Smith's implement, but the absence of the lateral spur which characterises the Deanston subsoil-plough, must render it a less efficient implement. In this, however, never having seen it at work, we do not speak from experience. It will be easily seen that when in full work the uppermost tooth is in advance of the second, and that again in front of the lowest, so that the tenacity of the soil and subsoil which hinders the motion of the implement is, as it were, overcome piecemeal, and probably with less resistance than would be presented to the action of any other method. The efficiency of this implement as a stirrer of all the subsoil is, however, far from perfect.

Attempts have been made to combine in one implement the subsoil with the common plough which ordinarily precedes it. Perhaps the most successful of these is that which has resulted in the construction of an implement now manufactured by many parties, which appears and acts first as a common plough worked by two horses, and then, by a simple removal or lifting of the mould-board, is fitted to act as a subsoil-plough, and, in returning, to stir the bottom of the furrow which has just been opened.

THE READING SUBSOIL PLOUGH.

The same objection exists to another form of the subsoil-plough, of which a figure is given below, which was invented and is manufactured by Messrs. Barrett and Exall, of Reading.

The triple-toothed form of this implement was intended to diminish the force required to draw

The Charlbury subsoil plough, figured below, invented by Mr. Pusey, and described in the first volume of the English Agricultural Society's Journal, is the result of another of these attempts.

THE CHARLBURY SUBSOIL PLOUGH.

* Thus, in the Report of Lancashire, by Dickson, there is the following notice of the "miner, or deep-stirring plough:"—"This is another tool of the plough kind, somewhat similar in its nature, which was introduced into the county nearly about the same period as the trench plough. It simply consists of a ploughshare firmly fixed to a strong beam, by means of a strong sheath and handle, without any mould-board. It is usually drawn by four or more horses, being made to follow, in the furrow, the common plough, so as to penetrate into, loosen, and stir up the undersoil, without turning it up, to the depth of from 8 to 12 inches below the tract in which that plough had gone." A more accurate description of the way in which the implement is used than is contained in this paragraph of 1813 could not be given now.

This figure is sufficiently instructive as to the nature of its construction; it is not, we believe, found to act well in practice, as the tendency of the attached tooth is to lift the implement behind so as to hinder its efficient action as a plough. Another implement, which probably originated in this invention of Mr. Pusey's, was first exhibited by Mr. Bruce, of Teddington, Stratford-on-Avon, at Derby, and is mentioned approvingly by the Society's Judges. It differs from the Charlbury subsoil-plough in the position of the stirring-teeth, which are situated not in the wake of the mould-board but considerably in front, and to the right side of it, so that they work in the last furrow that was opened, and stir the bottom of it just previously to its being filled and covered by the furrow-slice in the act of being turned. This arrangement is said to be effective without at all deranging the action of the implement, or throwing additional labour on the holder. The most efficient mode of subsoil-ploughing is, however, doubtless that recommended by Mr. Smith of Deanston, in which a good wide plough precedes his implement, drawn by 4 or 6 horses.

The advantage of subsoil-ploughing land which has below it a sufficiently frequent occurrence of channels—be they natural or artificial—through which the water held in it may rapidly escape, is unquestionable. The gardener does not hesitate to take every opportunity of deepening his soil, and the farmer's interest is identical with that of the gardener. To increase the fertility of the soil, by rendering a greater depth of it permeable to the roots of plants, and by rendering it independent of our variable climate, should be the object of both; and no means are so likely to accomplish it as subsoil-ploughing *after* draining.

Among the various subjects connected with the practice of Agriculture which offer themselves to us for comment, there is one of great importance, to which we are desirous of calling the special attention of our readers. We allude to the improvement which may be effected in the condition of the agricultural labourer by the general introduction of the allotment system.

To improve the condition of the agricultural labourer is a highly important object—one well deserving the attention of every person engaged in the cultivation of the soil. To remove the depression and distress which too often constitute the lot of himself and his family, and to elevate them in their moral and intellectual character, is a noble project; the accomplishment of which would annihilate the most prolific sources of pauperism and crime, and substitute a cheerful, willing, and able workman in the place of a discontented and depressed one.

Of all the measures which have been adopted for the promotion of this important end, none appears to be more easy of introduction, or more efficient in the accomplishment of its purpose, than the system of allotting to the labourer a small portion of land, which may be cultivated by himself in his hours of leisure, and by his wife and children, without infringing on the time occupied in the service of his master. The size of the allotment should vary with those circumstances of the family which affect their capability to cultivate—such as the age, strength, and leisure of the man, and the number and age of the children. Half an acre may be considered as a medium size.

Provided with such an allotment the labourer has a savings bank—if we may adopt the term—in which he may invest all his spare money and labour; and one of the first results will be that these will flow into the channels thus provided for them, instead of being lost or squandered in the beer-house. The produce of the allotment increases his income materially, and adds to his family comforts; he becomes contented and happy, and regards with pleasing satisfaction the stake which he possesses in the property of the community. A happy effect upon his moral character is the consequence. Placed in a situation of comfort, independence, and contentment, he is more likely to discharge his duties towards society than if in a state of dependence and misery; one is the atmosphere of virtue, the other of pauperism and crime.

The benefit thus conferred on the labourer is productive of great advantage to the community, and to every individual of it. The labourer pays a good rent for his land, and pays it with punctuality. He cultivates it highly by manual labour, and supplies it abundantly with manure from his cottage and his pig. The produce is therefore large. Neither himself nor his family are burdensome to the community, either in a workhouse or a gaol, but instead of dependent paupers or lawless criminals, society obtains orderly and productive members.

The allotment system has been carried out to a large extent in various parts of the kingdom, and abundant evidence has thus been afforded of its many advantages. The Agricultural Employment Institution, which was established in 1833, turned its attention to this subject, and collected some striking facts, which were published in the form of a pamphlet, but are probably little known. The Institution is since extinct. We extract a few of the most remarkable cases.

"*Colerne, near Bath.*—In 1818, twenty-nine acres of land left in trust for the poor, under the superintendence of the clergyman, were divided amongst thirty families. Prior to the year 1818, this land was let to a large farmer, at only 15*l.* per annum.

"Results:—The tenants and their families have been rendered all honest and respectable; *they have been kept entirely free from parish relief*, and become the farmers' most steady and industrious labourers; the land is so greatly improved by spade husbandry, as to be worth double its value at the time it came into the hands of the poor."

"*Crondall, Hants.*—The allotment system has partially existed in this parish (which contains nearly 1200 inhabitants) since 1819, but of late years has been increased, until 150 acres have been divided amongst 120 labourers, some of it being the very best land, and let as high as 3*l* per acre, free of tithes and rates.

"Results:—The land is improved, poor-rates are reduced, rents are regularly paid, and new applications for land are made every year. Crondall, which was notorious for thieves and poachers, is now quite altered, and not a man from thence joined in the riots of the agricultural labourers which occurred in the neighbourhood in 1830."

"*Long Newnton, Wilts.*—This parish in 1830 contained forty-two labouring families, all wretchedly poor, the rates paid to them in six months, from October, 1820, having amounted to 206*l.* 8*s*. Every cottager was offered as much land at a farmer's rent as he and his family could cultivate, without interfering with the labour required by the farmers, if they would endeavour to raise themselves above the poor-rates by their own industry. All accepted the offer, except four infirm old men and two poor widows with large families. They had their land on lease, one acre and a half each of arable land; and, when any of them could purchase a cow, were allowed three acres of meadow land, at the rate of 5*l.* 4*s*. per annum for each cow.

"Results:—By the autumn of 1823 every labourer in the parish, except two infirm old men, had not only emancipated himself from the poor rates, but had also punctually repaid the sum of 44*l.*, which had been lent them to purchase tools and seeds; each family had got into cultivation their acre and a half of land; and two or three of them had claimed their Grass-land, having saved money enough to buy a cow; and one family had two cows. The rates for the six months from October, 1823, was only 4*l.* 12*s.* 6*d*. The labourers were reclaimed from idle and bad habits, and became most valuable servants. The widows, before this time, had also taken land, and supported themselves and families without parish relief, although one had six and the other eight children."

"N. Atherton, Esq., of Calne, having come into possession of some property at Kingston, St. Michael's, Wilts, about 6 years ago, immediately let out to the poor forty acres of land in allotments of from three to four acres, at the farmers' rental. This land is well cultivated, and considered to produce 50 per cent. more than any other land in the neighbourhood; *the labourers are raised from a disgraceful state of pauperism* to an honest independence, and the poor-rates are reduced to a comparative trifle."

"*Dauncey, Wilts.*—Some years back the farmers of Dauncey let to the poor labourers of their parish with families, three acres of land each, at 2*l.* per acre; and soon afterwards the late Lord Peterborough built a barn for them, where they could thresh their corn.—Those men struck their names off the parish-books, and brought up their families in habits of industry and honesty, and all of them cheerfully paid towards the support of the aged and infirm of the same parish."

What evidence could be offered more striking than this, to prove the efficacy of the allotment system in diminishing—we may almost say annihilating—pauperism and crime, and improving the moral, intellectual, and physical condition of the labourer? What solid objection can be urged to the universal adoption of the system? and why, with evidence such as this, afforded so long ago, do we not find every agricultural labourer in England, who has a wife and family around him, and every single labourer in circumstances to be benefited by it, settled on his allotment of land, an independent and a happy man?

We purpose continuing our remarks on this subject, offering further evidence in support of our views, answering objections which have been raised against the system, and pointing out what we conceive to be the best practical method of effecting its general introduction, and promoting its beneficial operation.—*F.*

ON THE BEST SPRING CROPS FOR FOOD.

[The following paper was read by the Rev. R. Morris, of Eatington, at a late meeting of the Farmers' Club, at Stratford-on-Avon.]

The points for consideration are—the earliness, quantity and quality, cost of production, and the influence on the succeeding crops of the different kinds of artificial spring food for cattle.

The various sorts may, perhaps, be comprised under Lucerne, Rye, Rape, Rye-grass, Italian Rye-grass, Trifolium Incarnatum or Annual Crimson Clover, Red Clover, Cow-grass, Winter Barley, Cow-cabbage, and Winter Vetches.

Lucerne may be managed in two ways:—Either by preparing a good piece of land, got quite clean and well filled with manure, and reduced to as fine a mould as possible, and drilling the seed, in April or May, from twelve to eighteen inches apart. It should not be sown too early, for its first growth being very delicate, the late frosts in the spring will destroy it. And I should give the preference to eighteen rather than twelve inches, because you can then run the plough between the rows at the end of autumn, and thereby afford a greater facility for cleaning it early at the beginning of the year; and the greater distance also enables you more readily to manure it. After the first cutting, if the spaces between the rows be well hoed and cleaned, it will add much to the growth of the plant. By adopting this plan, supposing Lucerne sown this year, it will be fit for the first cutting in the middle of April next; it may be cut twice or even three times in the first year, and then it will bear cutting five or even six times. Or should this be thought too expensive and troublesome a process, it may be sown broadcast, and harrowed in with Barley, in the same manner as Clover and other artificial Grasses are sown. The quantity of seed should be about 20 lbs. an acre. A field of 11 acres so sown, was mown three times the first year; in the second, it supported from the first mowing, with a small addition of Oats, 30 horses for seven weeks; from the second, 20 horses for seven weeks, without anything else; and from the third, with a small addition of Oats, 20 horses for six weeks. The value of the produce may be estimated at 11*l.* an acre, after deducting all the expenses, rent, and other charges. In the third year it maintained 35 horses for eight weeks, with a small addition of Oats, from the first mowing; from the second, nearly the same; and from the third, although not so productive, yet it was of great value and benefit, on a farm where there was little pasture. It would be easy to adduce many other instances of the productive power of Lucerne. This plant will stand and grow vigorously for 10 or 12, or even 15 years, if nurtured with soot, malt-dust, farm-yard manure, or guano. It produces a great deal of milk in cows and ewes, and it is highly relished by them. It should be cut just before it has come into blossom; and being mown on the preceding evening, it should be removed for use on the following day. Should it be objected that it is a long time in coming to perfection, it may be answered that it is not more so than Clover; and that this "plant of plants" is a giant from its infancy, advancing from strength to strength. There are many varieties of it, but the purple-flowered is the most profitable to the cultivator. It ought to be added, that it may be made into hay, and forms excellent fodder; but it is much better adapted for what is called *soiling*. This most valuable Grass is best cultivated on a good, dry, warm Barley-soil; still it answers very well on a stiff clay, as I have proved by my own experience, and that of a neighbour, on a similar land. Whenever the land returns to the ordinary rotation of crops, it has been found more congenial to production. It has been stated by one of our most intelligent and practical farmers, "that no farm, if it has a suitable soil, should be without Lucerne, in the proportion of one acre (at the least) to every four horses."

Rye is the earliest Grass used as spring food for cattle, next to Lucerne; and this, together with its bulk, forms its chief recommendation; for, unless cut quite young, it is not much relished by cattle. It flourishes on a poor sandy soil or heathy land, where other Grasses would not grow. In the work on British Husbandry, published by the Society for the Diffusion of Useful Knowledge, it is stated that the soils most appropriate to the growth of Rye are those that contain the greatest proportion of sand; and, on the authority of Von Thaer's "Principes Raisonnés d'Agriculture," that it is the only Corn which can be grown upon land which is composed of a mixture of more than 85 per cent. of sand with other earths. The preparation and culture of Rye are essentially the same as for Wheat, than which it is much more hardy, but infinitely less valuable. Within the memory of man, it formed a chief part of the food of the poor of this kingdom, as it does now in the North, and other parts of the Continent; but I fancy the use of it with us, after having been accustomed to good Wheat bread, would occasion a good many *wry* faces. It should be sown at the latter end of August, or early in September, in the proportion of three bushels and a half to the acre. The land should have been previously manured. It may be sown either broadcast or in drills, but the latter is preferable, as it affords an opportunity of hoeing and cleaning the land. Being a hardy plant, it will stand the winter, even when very severe indeed. In a Prize Paper in the Journal of the Royal Agricultural Society, it is stated in reference to the management of Rye—"So soon as the Wheat is cut in the autumn the plough should be set to work. This may be done even before it is carted, during the mornings of harvest. A single ploughing is given, and a very slight dressing of any kind of short manure. In some cases, where the farmer

lays on his manure in the autumn for Turnips the ensuing year, it might be better to lay it on before the ploughing. It should be remembered that the slight dressing should not at all be considered as given to the Rye; in reality, it becomes incorporated with the soil, and more intimately mixed with it than by the ordinary mode of spreading it on in the autumn, and any part of it which the Rye may abstract, will be more than compensated by the droppings of the stock, and the carbonic acid gas which they evolve while consuming it, and which the soil more readily absorbs in the spring than in any other part of the year, evaporation going at that period to a much smaller extent than in any other. The advantages of its cultivation are summed up thus:—Provision of excellent green food is made at a season of the year when, of all others, it is most wanted. It is produced without sacrificing any portion of the usual rotations pursued on a farm, and with little extra labour; nor does it interfere with the management of any preceding or succeeding crops. It will grow on any soil, but it is especially calculated for poor loose land, when every other green esculent is more or less uncertain. It will bear any degree of frost to which our climate is subject, and is sufficiently hardy to defy the effects of the coldest situations in the country, being there cultivated instead of Wheat for a corn crop, from necessity. It is as inexpensive, or more so, than any Grass or leguminous plant. It is readily consumed by stock, especially young animals. It improves rather than deteriorates the soil upon which it is grown. On the other hand, it is only fair to state the observations of others in answer to these high praises. Loudon remarks that husbandry must be bad or unfortunate which requires the necessity of having recourse to it. The opinions of practical agriculturists, so far as I have been enabled to obtain them, are divided. From one I find that, after several years' trial, he has at length abandoned the use of it, from a conviction that it injures the succeeding crop; and that he could always tell, to a yard, from the appearance of the following, where the Rye had preceded it. Another considers there is something poisonous in its nature to other plants, and that he has invariably found the wire-worm most destructive after Rye. From others I have been informed they always grow a certain portion on their best land, and they are satisfied that the early and abundant quantity of green food it supplies is of the greatest value. It may be matter for consideration in the present peculiar season, whether it would not be advisable for the farmer, at all events this year, to supply himself with this earliest food for his cattle, in default of Swedes, Hay, and indeed, Bean and Barley straw. *(To be continued.)*

PROPER TIME TO REAP WHEAT.

The discussion and remarks in some of your late Numbers respecting the best time to harvest Wheat as regards its state of ripeness, has recalled to my remembrance a circumstance which occurred some five or six years ago. I was visiting a friend in an excellent Wheat-growing district beyond Hounslow, and when conversing with a neighbouring gentleman in whose Wheat-field we were walking, my friend remarked that his piece of Wheat was the forwardest thereabouts, and would be fit to cut in a fortnight. The gentleman said he meant to cut early, as he had understood was often done in parts of Herefordshire, the millers liking the Wheat all the better for it; and he intended to begin on Monday week. Upon which I remarked that if the grain had ceased to derive nutriment from the straw it might be cut to morrow, and that it would be easy to ascertain that by examining the thread-like connection of the grain (which I shall call the umbilical thread) to the receptacle, whether the grain had ceased to receive nutriment. Whereupon we first searched for and found at the edge of the cart-way a plant in a quite green and growing state, and examining it, saw that the umbilical thread was in a healthy and growing state, and the grain still milky. We next selected several ears from the crop (not the ripest), and on examining them saw that the umbilical thread was in a withered state, and incapable of conveying nutriment. Afterwards we selected some of the ripest ears, and saw the umbilical thread quite withered and dry. But these ripest ears were far short of being dead ripe. The gentleman said, "This examination has convinced me, and I will begin to-morrow." He did so, was satisfied with the result, and continues the practice. His immediate advantage was that he was enabled to prepare his land and get a good crop of mouse-tail or stubble Turnips. The harvest of that year was generally prolonged by very rainy weather, and in about a month after the examination I saw his Turnips being hoed and a neighbour's sprouted Wheat being carted on the same day. Now there are many reasons why Wheat should be harvested as soon as it can be without loss of quantity or quality of the grain; and I will suppose that it may be, and ought to be, done at least a week earlier than is usual by the present general practice, and then the following may be some of the advantages to be gained:—viz., a week's time in operating upon or cultivating the land, in consequence of the crop having been so much the sooner cleared off; the avoidance of a week's plunder by sparrows, other cone-billed birds, and feathered game; which, in consequence of being deprived of a week's corn-food, may confer a benefit by feeding on the seeds of weeds, such as Polygonum aviculare, and other Spergula, instead; less grain will be wasted by scattering, as ears are less liable to be broken off and the chaff less liable to loosen, than when fully or dead ripe; the Straw must be of better quality for every purpose. If the crop of Wheat should be thin, then, if seeds should have been sown or the field foul with weeds, there will be a week's less growth of green rubbish to retard the drying of the Straw in sheaf; and if the crop of Wheat should be heavy (which would as a matter of course half starve any seeds sown), then the young seeds would a week sooner begin to gain strength against the winter. I am not a practical farmer, and for that reason cannot precisely say what all the advantages would be, but I hope some of your correspondents will enlighten your readers on the subject. I do, however, know a little of botany, so far as English plants are concerned, and though still less of vegetable physiology, yet I venture to assert that the plan of examination of the umbilical thread will be a sure guide. —*J. C. X.*

SKETCHES OF EAST LOTHIAN HUSBANDRY.

[The communications of the two past weeks from Mr. Sullivan, on the operations of the harvest, were published in order that they might be seasonable, before his previous papers on Tillage operations were concluded. The following is the last of the latter series.]

Fallowing.—Although the practice of fallowing has existed from the earliest ages, it appears to have been entirely unknown in Scotland till about the commencement of the last century. The singular means by which it was introduced into East Lothian, and the unfavourable light in which the practice was there first regarded, are thus given by Somerville in his Survey of the County, drawn up for the Board of Agriculture:—"Two persons of high respectability are mentioned as being the first who followed the practice; the one a proprietor, the other a farmer. The proprietor was the Right Hon. Thomas, sixth Earl of Haddington, who set the example upon his own estate. The farmer was Mr. John Walker, in Beanston, as we are informed from respectable authority, who took the hint from some English travellers, while they spent a night at his house, and with whom he had a good deal of conversation upon the subject, so much to his satisfaction that he made an experiment upon six acres the following summer, which he carried through in spite of the animadversions of his neighbours, who were divided in their opinions as to the sanity of his mind or the stability of his circumstances. The result of the experiment gave them a better opinion of both, and the return was so abundant as to induce him to extend his next year's fallow break to twenty acres; soon after which the practice began to spread, and so early as 1724, fallowing upon all the deep strong soils was common throughout the county."

The practice of fallowing thus soon became general throughout East Lothian upon all kinds of land, but the extension of furrow-draining and of drilled crops, which admit of considerable after-culture, has greatly contributed to render bare-fallowing less frequently indispensable upon strong adhesive soils, and altogether unnecessary upon those of a light friable description. The land in this county is too high rented and too valuable to devote any portion of it unnecessarily to an entire year's cultivation without producing any immediate return; fallowing, therefore, is now almost exclusively restricted to the strong cold adhesive clays, which have not been yet properly drained, and on which the cultivation of Turnips would be very unprofitable in many seasons, and most laborious and expensive in all; or to land which has become so much infested with Couch-grass (Triticum repens), Knot-grass (Arrhenatherum avenaceum), and other weeds, that their complete destruction could not be effected while preparing it for green crops. The extension of the culture of drilled crops has, no doubt, greatly diminished the extent of land annually under bare fallow; but for many reasons, which it is unnecessary here to specify, these crops have not entirely superseded the process, and are not likely to do so for a considerable time to come. Wheat, the staple crop of East Lothian, is the most valuable production of our strong heavy soils, and for it summer fallow evidently affords an excellent preparation; but independently of this, another and perhaps a stronger reason for annually devoting a certain portion of the farm to fallow, arises from the fact that almost the whole of the operations connected with the process are performed at a time (from the conclusion of Turnip sowing till harvest) when the men and horses, at least the latter, would be otherwise comparatively idle. Although strong, stiff, adhesive clays—the only description of land upon which bare fallows are held to be indispensable—derive undoubted benefit from aeration during the summer months, yet no farmer here ever thinks of sacrificing so much rent and labour in fallowing land merely to afford his men and horses constant employment, or to give the soil rest and the benefit of exposure to the atmosphere; but when a field, or some part of it (for an entire field is seldom fallowed indiscriminately), becomes, after a course of cropping, excessively foul with root-weeds, bare or naked fallow is resorted to as the only effectual means of extirpating the greatest enemies with which useful crops have to contend.

The first or winter furrow for fallow is seldom given until the other stubble land intended for green crops has been ploughed. Either of three methods of ploughing is adopted, according as the land may be in a wet or a dry condition. In wet retentive soils, the ridges are either gathered up or cloven out into halves, keeping the furrows open in order to preserve the land in a dry state in winter; but the general mode of ploughing is casting.

The second ploughing is sometimes given after the spring seed-time is past; but unless the weeds happen to be very numerous and luxuriant, it is most frequently delayed until the Potatoes and Swedish Turnips are sown. If gathered up before, the ridges are now cloven down, and *vice versâ*. This ploughing is also not unusually made in a direction crossing the ridges, but in whatever manner the land may be ploughed, it remains in that state until the Turnip-sowing is completed. Should a fall of rain, however, occur after a continuance of dry weather, advantage is taken of it, and when the surface becomes sufficiently dry again, it is harrowed with facility into a fine state, which effectually disengages the weeds from the soil and exposes them to the atmosphere.

As soon as the Turnip-sowing is finished, which is usually about the end of June, the working of the fallow is again resumed. After the weeds, brought to the surface by previous operations, have been gathered off, the land is ploughed in a direction crossing the former ploughings, and as deep as the strength of the horses can accomplish. Deep ploughing is deemed indispensable at this stage of the fallowing process, not only to increase the depth of active soil, but also to bring to the top the roots of all vivacious weeds. After being ploughed the land is repeatedly harrowed and rolled; the grubber is also employed with effect at this stage, in dragging to the surface root-weeds remaining in the soil.

As the great object is the thorough extirpation of weeds, the utmost attention is bestowed, and considerable expense incurred upon their collection. The quickens, as the roots of the Couch-grass and other weeds are termed, are disposed of in different ways, according to the state of the weather and the inclination of the farmer. When the surface admits of being reduced to a fine tilth, the strong vegetative powers of the root-weeds thereby exposed to the weather, are frequently destroyed by the powerful heat of a July sun; and in this case they are ploughed down again into the land with safety, economy, and advantage. But the long continuance of dry and warm weather, requisite to destroy Couch-grass, seldom occurs here; and hand-picking, tedious and expensive though it be, is therefore the most general way of getting rid of the enemy. After being gathered the weeds are sometimes burned, and the ashes spread upon the surface; but the usual, and perhaps the most judicious practice is, to cart them to some convenient corner of the field, to be afterwards formed into a valuable compost with quick-lime.

In most cases the land is a second time cross-ploughed, reversing the last furrow-slices, well harrowed and rolled, and any weeds which may still appear are hand-picked as before, after which it is, in ordinary cases, perfectly clean; at all events the ridges are now formed in order to provide against wet weather. They are always gathered up, and every attention bestowed in giving them the necessary and uniform degree of curvature. The original ridges are usually followed in marking off the new ones; but if it be desirable to alter their direction or breadth, this is the proper time for doing so.

The application of manure is the next operation. The usual practice is to convey the dung to the field some time before it is required for use, in order to undergo the necessary process of fermentation, and to have it at hand, but when the field lies contiguous to the farm-offices the dung is commonly prepared in the yards. In either case it is carted along the ridges, and pulled out by a man with a dung-drag into equal and equidistant heaps, proportionate to the quantity allowed per acre. To facilitate and insure accuracy in spreading, the middle of each ridge is sometimes lightly rolled. The ploughs follow close upon the spreaders, in order to prevent any loss arising to the dung from evaporation. Lime is also frequently applied to fallow, with or without dung: it is scattered upon the surface and ploughed in with a light furrow, and incorporated with the soil by the action of the harrows. Many farmers consider this to be the most judicious period for the application of lime to the land.

In ploughing in the dung the ridges are gathered up again, by which an increased degree of curvature is imparted to them, or cast by ploughing two ridges together. In either case the furrow-slices are taken broad and shallow in order not to bury the dung too deep. This ploughing generally concludes the fallowing process, nothing more being done with it until seed-time, when it receives the last seed-furrow. Instead of giving the seed-furrow in the ordinary manner, some farmers plough the ridges into small drills about 10 inches apart. This is what is termed ribbing, and its object is to prevent the throwing out the plants in winter, by affording a good cover to the seed. The preceding operations are in most cases completed about the end of July or early in August if the season have proved favourable, but the working of fallows is often continued during harvest.

Land is generally fallowed after a crop of Wheat or Oats, but when a Grass-field happens to be in a very dirty and unthriving condition, it is in many instances ploughed up during the summer, cleaned and otherwise prepared for Wheat to be sown in the succeeding autumn. Wheat usually precedes and succeeds the summer fallow. Many farmers have found, however, that the young plants of that crop are very liable to be thrown out of the soil by the influence of the winter frosts, when sown on fallows; it is not uncommon, therefore, to grow Oats or Barley instead of Wheat on bare fallows, where the soil is of that strong clayey character so much affected by alternate frost and thaw in winter.

I have now briefly detailed the general routine of fallowing pursued in the best-conducted farms in this county; but the nature of the season, the quality and condition of the land, and other circumstances, often render it expedient to vary the mode of procedure. As the leading objects sought to be attained by fallowing are the effectual extirpation of weeds, and the minute

pulverisation of the soil, the course of management must be varied according to circumstances, but the different operations persevered in till the land is rendered perfectly clean, and has acquired a certain degree of mellowness. No rules can therefore prescribe the exact number of ploughings, harrowings, &c. to be given; all these are regulated by the weather, and the nature and condition of the soil. The present season has been peculiarly favourable here for cleaning the land, and executing all the operations connected with fallowing.

Subsoil Ploughing.—Although the utility of subsoil ploughing, in connection with thorough draining, as a means of improving stiff clays, incumbent on retentive subsoils, is beyond a doubt, it is scarcely at all practised by the farmers in this county. With the view of ascertaining to what extent the operation is really beneficial, the East Lothian Agricultural Society offered, in 1837, the liberal premium of 21*l.* for the best Report of Experiments on Subsoil Ploughing, as compared with common ploughing. The prize was competed for, and obtained by Mr. Brodie, of Abbeymains, near Haddington. The land selected by Mr. Brodie for experimenting upon had been previously drained in every furrow, 18½ feet apart. It was fallowed in the early part of summer, and alternate portions of the field subsoil-ploughed along the ridges to the depth of 16 inches, immediately before applying the dung and giving the seed furrow. These experiments extend from crop 1838 to crop 1843, both inclusive; and from Mr. Brodie's valuable Report it appears that, although the produce of the first crop (Wheat) was not greater upon the subsoil-ploughed land than upon that ploughed in the ordinary manner, yet the increased produce of the last three years has more than compensated for the trouble and expense attending the operation, as the following summary of the results of the experiments shows. It may be proper to observe, that after the first crop the field was pastured with sheep for two years, and then ploughed up in 1841 for Oats:—

Increase in Oats of 10 bushels per Scotch acre, at 2*s.* 6*d.*	£1	5	0		
6 cwt. Straw, at 1*s.* 8*d.*	0	10	0	—£1	15 0
On Beans of 3 bushels, at 4*s.*	0	12	0		
Straw, 1¼ cwt., at 2*s.*	0	2	6	— 0	14 6
On Wheat, of 2 bushels, at 6*s.* 6*d.*	0	13	0		
Straw, 5 cwt., at 1*s.* 8*d.*	0	8	4	— 1	1 4
				3	10 10
Expense per acre of the operation				2	0 0
Profit per acre on the rotation				£1	10 10

The manner of performing the other tillage operations, such as harrowing, rolling, grubbing, horse-hoeing, being the same in this as in other parts of Scotland, does not require any further notice in this place.—*T. Sullivan.*

ON MINERAL AND INORGANIC MANURES.
No. XXVI.
By Professor Charles Sprengel.

c. Peat-Ashes.—If we consider that the ashes of the different sorts of peat are composed of different mineral substances, mixed in very varied proportions, and that there are amongst them substances either most nutritious to plants, or such as decompose the humus, it will be easily seen why their use as manures is at times very beneficial, whilst at others they avail nothing, nay, even are hurtful to the crops. The difference between peat and wood-ashes consists especially in their great amount of silica, oxides of iron and manganese, and gypsum; moreover, they never contain carbonate of potash, which is to be found in all ashes of wood and other plants, because if they contain potash, it is always combined with sulphuric acid. It is gypsum, chiefly, which constitutes their value as a manure, which, however, has been hitherto taken no notice of.

Those sorts of peat which have a small specific weight, and are of a light-gray colour, are considered the best, whilst the red are considered worth little or nothing; still these criterions are very deceptive, as at times the light and gray coloured manure much less than the red and heavy ones. Whether peat-ashes will be a good manure can be decided only by experiments on the fields, or chemical analysis, of which the latter is the surest, because experiments on the field may be accompanied by circumstances which will prevent the perfect action of the ashes. I have examined many sorts of peat-ashes—both such as produced very little or no effect, as well as such as many years' experience has proved to possess great fertilising power, amongst which latter were several famous Dutch peat-ashes. I place here the results of these analyses, as they not only best explain their action, but as they can serve agriculturists as a means of judging the value of such as they have at hand.

1. *Dutch peat-ashes*, of acknowledged best quality (gray) 100,000 parts consisted of

47,140	parts	of silica.
4,446	,,	alumina.
6,592	,,	oxide, and a little protoxide of iron.
1,000	,,	oxide of manganese.
13,634	,,	lime, partly united with silica.
4,940	,,	magnesia ditto.
0,200	,,	potash combined with sulphuric acid.
1,013	,,	soda, mostly combined with chlorine into common salt.
7,208	,,	sulphuric acid, combined partly with lime, partly with potash and soda.
1,992	,,	phosphoric acid, mostly combined with lime, partly also with iron.
1,144	,,	chlorine combined with soda into 1,907 parts of common salt.
4,091	,,	carbonic acid, combined with lime and magnesia.
6,600	,,	carbon and remains of peat.
100,000	parts.	

2. *Dutch peat-ashes*, inferior quality (gray) 100,000 parts consist of

55,920	parts	of silica.
3,148	,,	alumina.
5,376	,,	oxide of iron, and a little protoxide of iron.
4,340	,,	oxide of manganese.
8,648	,,	lime, partly combined with silica.
1,560	,,	magnesia ditto.
0,228	,,	potash.
3,855	,,	soda.
6,446	,,	sulphuric acid, combined with lime, soda, and potash.
0,833	,,	phosphoric acid, combined with lime and iron.
6,354	,,	carbonic acid, combined with lime and magnesia.
2,992	,,	chlorine combined with sodium into common salt, and with potash into chlorate of potash.
100,000	parts.	

As both these sorts of peat occur in the vicinity of the sea-coast, it is more than probable that their great amount of common salt owes its origin to salt water. They are conveyed from Holland to Belgium, where they are very important for the growth of Clover, as it is believed that it could scarcely be well reared without the Dutch peat-ashes, which, however, *would* be the case, without any doubt, if it was manured (instead of the ashes) with gypsum, common salt, bone-dust, and some other mineral substances, which are to be found in the ashes. Great expense would probably be thus saved. Still the Belgians believe that the peat-ashes contain a substance unknown, which greatly improves the growth of plants. Besides Clover, they use this manure in Belgium for Rape, Potatoes, Flax, Peas, &c., but never for *Barley*, which consequently, the great amount of gypsum seems not to benefit.

GEO-AGRICULTURAL NOTES ON SOUTH GLOUCESTERSHIRE.

(*Continued from page* 628.)

New Red Sandstone.—This formation, occurring as it does almost exclusively along the sides of the hills and highlands capped by the lias, does not cover any very great portion of our district. The beds of which it is composed are of three kinds, sandstone, red marl, and magnesian conglomerate. The first of these is the least extensive of any. It occurs in a narrow band, overlying the marl along the edge of the coal strata, which it also covers between Stapleton and Winterbourn by Frenchay and Hainbrook. It is a sandstone of a dark-red colour, much more crystalline in its appearance than the indurated marls of the second member of the series. It frequently contains small siliceous pebbles, or rounded masses of flinty matter. It is a soft stone when first quarried, but acquires hardness on exposure to the air, and is then used as building-stone. A yellow sand occurring in this member of the series is dug at Bristol, and sold for the purpose of strewing on the floors of cottages. The red marl of the new red series occurs along the edge of the hills capped by the lias. Thus, from Henbury, where it overlies the magnesian conglomerate, we trace it along the edge of the highland by Over, Almondsbury, Elberton, Lyttleton, and Oldbury, where the tract is of considerable width. A section from this spot towards Thornbury, shows that here also it overlies the strata of the magnesian limestone, on which that town is built. From this its western boundary, which has been all along its junction with the alluvial deposit, it proceeds in a very tortuous course, by Rockhampton and Hill, to Berkeley, where it overlies a sandstone of the old red series. The junction-line of the two runs from Berkeley, south by Stone-common, under the edge of Whitecliffe-park, by Falfield, to Moreton, where it again overlies the dolomitic conglomerate. The junction of the marl with the clay of the old red sandstone from Berkeley to Moreton is very obscure; indeed, in tracing it on the map, one is guided more by the undulations of the surface than by any sectional appearances. The red marl occurs also in the neighbourhood of Newport, where it joins on the old red sandstone and the lias, overlying the one, and being overlaid by the other. I have already described the line of its junction with the lias from Raynham-fields to Wickwar, where it terminates in a long narrow valley, at the bottom of which a bed of magnesian limestone is exposed. In the marl at Wickwar a bed of strontian occurs; a section of it is seen on the road-side below the church.

From Wickwar a narrow band extends as far as Bury Hill, where the strata of magnesian limestone again appear. From Chipping Sodbury, where it again commences, it extends along the edge of the hills under the lias, by Westerleigh and Liston to Wick, where it surrounds Home-apple-hill, and passing down both sides of the Golden Valley below Wick, leaves an open space in which the rocks of the coal strata occur. This band extends below the edge of the lias, from Keynsham westwards as far as Bristol, the greater part of which is built on it. From Bristol it runs by Stoke Gifford as far as Itchington, bounded on the one side by the lias, and on the other by the band of sandstone we have just described.

At Aust the section of these marls there exposed contains in the lower part of it a great quantity of gypsum, which is arranged in layers corresponding with the planes of stratification, and, being connected together by vertical veins and fissures, a reticulated appearance is presented. No use is made of this gypsum in an agricultural way, though its value as a fertiliser has been fully proved. The clay of this bed is used for brick-making near Winterbourne, for which purpose it answers admirably. The clay in its immediate vicinity on the lias formation, although stiff, and apparently good for the purposes of brick-making, is too calcareous, and would, after burning, speedily crumble, in consequence of the slacking of the lime formed.

The Dolomitic Conglomerate, the third member of the series, is most irregularly distributed over the surface of the district. The chief portions of the county, however, which it covers are near Thornbury, and in the Vales of Henbury and Westbury. Near Thornbury it covers a district two miles long and three quarters of a mile broad. This rock consists in general of fragments of the older rocks, mountain limestone, old red sandstone, and millstone grit, varying in size from that of a nut up to that of the human head, and cemented by a yellowish or a red-coloured mixture of the carbonate of lime and magnesia. It varies considerably in appearance. Thus, in the Thornbury district, while at Rockhampton it is so hard and splintery that it is difficult to form a hand specimen, near Thornbury it consists of large rounded masses, chiefly of mountain limestone, hardly kept together by an earthy cement.

The Agricultural Character of this formation differs considerably on the three members of which it is composed. The soil on the first of these is of a remarkably red colour; it is a light sand. Near Hanbrook it is of a purple-red colour. When taken in the fingers it soils them like a mass of paint. This land is wholly arable; where shallow, as is generally the case, it is wholly dependent on the weather. The season cannot be too wet for it. Even on this land, however, drainage has been attended with benefit. The general rotation followed, when any system at all is adopted, is the four-field course of Wheat, Turnips, Barley, seeds; but here, too, whenever land has by this management become sufficiently in heart, this rotation is left for one more severe. Thus, after Barley, seeds are taken, which are, during the first year, mowed and then seeded; during the second year depastured and broken up for Wheat; after Wheat Barley is taken; then Turnips and then Wheat again, which is followed in the usual way by Turnips, Barley, seeds, and so on. This is the least injurious of the departures from the regular course; for cases occur in this neighbourhood where land in good condition has been cropped during successive years with Wheat, till exhausted. Turnips and Swedes are always sown broadcast. Mangold Wurzel, which is far from being generally cultivated in the county, I saw growing on this soil, for which it is admirably suited. The gritty nature of the soil, by admitting the action of the atmosphere, causes the rapid decomposition of the manure in it, and thus fits it for the growth of bulbs and tubers requiring large supplies of nourishment. The lightness of the soil on this rock renders it very easy of cultivation; in this it is greatly superior to the soil on the marl. The surface of the marl being generally exposed on the side of hills, has an undulated appearance; this renders the soil easy of drainage, and the greatest improvement might be effected in this way, over the whole of the district. It is chiefly in pasture—not above one-sixth is under arable culture. The fields are not large, and they are frequently crowded with trees. Both the Oak and Elm flourish here; the finest Elms in the county occur on this formation, near and in Stoke Park.

When so small a portion of the land is arable it is seldom cultivated on any fixed system, and it is only in farms that are almost wholly arable that any regular rotation of crops is adopted. The kind of Wheat sown is the old Red Lammas, or for a spring Wheat, the White Essex. These two, with the Blue Cone for the stiff clays on the lias, are the three standard Wheats in this district, and, indeed, over the whole county. Between the sandy and clayey strata of this formation, I went over several fields of a deep sandy loam, either produced by the mixture of the two, or due to the disintegration of a stratum peculiar to itself. The land here is of a most valuable kind, combining the good qualities of that on either side of it; wet will not sour it—heat will not injure it. It is admirably fitted for the growth of Turnips, of Wheat, and of Oats and Barley. Little of this marl is drained; the pastures during winter are accordingly soaked. The establishment of a tile-work near Winterbourne by Dr. Fox, and the adoption by him of a system of drainage on his own farm, will, it is to be hoped, be productive of good. The soil on the dolomitic conglomerate, the third member, near Thornbury, where the rock has an earthy character, is of a light sandy nature. Near Bristol and Wick, where beds of clay occur in the rock, it is a stronger soil, and more fertile. It is there almost entirely pasture. In the neighbourhood of Thornbury about one-third is arable; the soil is frequently very shallow and easily burnt. Most of the arable land is devoted to the Potato culture, this district, with the surrounding neighbourhood, being the chief supply of the Bristol market in this article of food. Wheat is grown the first year, Barley next, then either seeds or Potatoes; if seeds, they are broken up for Potatoes, if Potatoes they are followed by Wheat. The Thornbury district is much crowded with Elm-trees, and the fields are generally small. Lime is used on this land generally once in a rotation, and is a most profitable outlay.—*M. S.*

Home Correspondence.

Drainage.—The castigation which my remarks in favour of one of our beneficial old practices have received, reminds me of an old sporting phrase—"It is a

dangerous maxim to bet odds against the favourite." Still, had they elicited a word of information in favour of the new systems, a good end might have been answered, and I might have been a winner. As only personal altercation is the result, I will say no more on the subject than may defend me from being misapprehended. I know tiles answer well in many situations, and do not object to their use; indeed I have drained with them myself. My objection extended only to the unscrupulous way of crying down practices which have been found beneficial, and which have the recommendation of experience, and taking up in their place new systems which are more expensive and backed chiefly by the opinions of theorists; tiles being decidedly more expensive than the Suffolk system of draining. My principal reasons given in favour of the draining which is chiefly pursued in my own county, are nearly as conclusive as the answer given by a celebrated breeder of the Southdown sheep, when asked why he preferred them to the Leicester:—"Because they answer my purpose better." I referred Mr. Girdwood to Mr. Pusey's Report on Draining, to show that Suffolk farmers are aware of the existence of the Royal Agricultural Society of England—which, by the bye, does not seem to extend its communications very far north; if it did, it might have spared my ludicrous ideas a little of the lash that has been applied to them. "To place tiles out of the way of any working whatever," they must be put little short of the bottom of an Artesian well, for I have a tile-drain on my farm well covered with stone, into which the worms have worked portions of clay through the apertures which let in the water. Your correspondent forgot, when addressing [illegible] to my remarks, [illegible] hill from the surface of the soil to the bottom of a drain on a perfect, level field. "Drains answering well for twenty years" only prove tiles equal to straw or stubble. I shall trouble you with only one more observation in answer to Mr. Girdwood. When I see practical men agree "as to how water gets into drains," and as to the uniform depth and width apart at which they are best made (which from your report of the late Yorkshire meeting does not appear to be the case at present), I will have no opinion of my own upon the subject; and I will give up my preference for transverse drains as soon as it appears practically clear that those parallel with the descent answer better. I can assure the learned Professor who has also, I find, noticed my remarks, and whose zeal for the advancement of science in Agriculture I duly appreciate, that it is only a fear of too much haste with too little speed, which has caused him to class me with the "half of intellect" men who do not like "new-fangled schemes."—*Farmer and Valuer, Stowmarket.*

Great Produce.—Having seen in Mr. Lowe's account of the appearance of the crops for 1844, at the beginning of which he speaks of the Oxfordshire Wheat-ears of 80 grains in each, I inclose you one from this parish which you will find has 5-set kernels, and contains in all from 115 to 116 grains. This is not, by the bye, a solitary instance in this neighbourhood this season; many persons have 6 and some even 7-set kernels.—*A. Barfield.*

Thick Sowing.—Some years ago I had a very respectable foreman, so bigoted to thick sowing that if I did not watch him he would have his own way. To cure him, I laid him a new hat that I would beat him, planting (with a dibble) only 4 gallons of Wheat per acre, 12 in. × 6, and he should sow 25 gallons (his favourite quantity); at harvest he brought me the account, and I beat him 2 bushels per acre. Mine was hoed only twice: it ought to have been at least thrice, and deeper. This cured him.—*R. W. P.*

Failure of Turnips.—As so many persons are complaining about their Turnips, I think it fair to state what has happened to myself. I took a small farm last year which had been considerably impoverished by the former tenant, and resolved to try what could be done with it. Having worked and dressed the portion for Turnips very well, I drilled the seeds with great care, but after sowing twice I have only got a fair crop by considerable attention to transplanting in the places where they failed. Anxious, however, if possible to secure the white Turnip, I procured some of Lawes' superphosphate of lime, and on the manured ground I drilled the seed with 2 cwt. of the phosphate, mixed with ashes sifted through a fine wire riddle. I sowed two fields, and both have come up well without any failure at all. They were sown on a Saturday and appeared the following Thursday and Friday. They were speedily in the rough leaf, grew strong, bright, and healthy; nothing has touched them yet, and nothing appears to threaten them. I am so satisfied of the efficacy of this stimulant that henceforth I shall never sow Turnips of any kind without it. If the ground is not manured I suppose 2 cwt. would not be sufficient, but in my case it has been ample; and really 14s. an acre is a small expense to secure such an object.—*E. C.*

Allotments.—As you express the wish, in your Number of the 7th inst., that the subject of allotting portions of land to the working classes may be kept before the public, I will state, in accordance with that wish, that almost nine years since I apportioned several acres of land amongst a certain number of agricultural labourers, and that off one of those allotments which consisted (the portion which was sown with Wheat) of 63 perches, the occupier has just threshed out 3 qrs. 1 bush., including the gleaned Corn, being nearly at the rate of 8 qrs. (or, as we in this county term it, 16 combs) per acre. This man grows Wheat and Beans alternately, and feeds the pigs with the Beans generally, whilst in a green state. He pays me at the rate of 2*l.* per acre, free of all other charges. I may remark as an inducement to landed proprietors to adopt the allotment system, which I have long considered as tending greatly to add to the comfort, and also to improve the moral condition of the working classes, that I have never, in any instance amongst a considerable number of such occupiers, experienced any difficulty in obtaining the rent. I have omitted to state that the land is always highly manured for both crops, and cultivated solely by the spade.—*A Subscriber, Norfolk.*

Potato Failure.—A great misfortune, of its kind, has befallen me this year: my late Potato crop has completely failed. The tops were magnificent—finer in many parts than I ever saw—yet the crop was absolutely nothing, certainly not nearly enough to replace the seed. The land is light, on gravel, well manured with stable-dung, in many places with Potter's guano, and frequently watered with liquid manure, of human urine and soap-suds. The early Potatoes, called here Church's Seedlings, bore very fairly, but never before have I seen the like failure, with so splendid a promise from the stalks. Now what was the cause? The season? perhaps so; as I fear a like result is found by some of my neighbours who did not treat the growing crop as I did; or is the fault the system of manuring I adopted? I am very anxious to know, as this was my grand experiment in consequence of taking in your *Gazette*. My crop of Onions and Carrots have been excellent. Altogether I am quite baffled, and shall feel greatly obliged by your advice. I got tanks made on purpose for my garden, especially for the Potatoes, which I grow in great quantities.—*R.* [We do not know how to explain this; your fault must have been one of omission, if it be [illegible] at all. The manures you applied cannot be blamed.]

Wheat.—The productiveness of Wheat has been frequently made a matter of newspaper astonishment, and I am almost ashamed to add my hundred-and first wonder; but as none of the published "Extraordinary Crops" come up to anything approaching to the produce of the "Mummy Wheat," I may as well be heard in its just praise. The inclosed is a single root, the offspring of a single grain, and bearing 57 stems; there were 59, but 2 were broken off by accidental roughness before I thought the sample worthy of special preservation: one of the ears also accompanies it in this letter—an average one, neither the longest nor the shortest. You will perceive that it contains 48 grains—call it 45; then, 45 × 59 = 2655, or as many fold. The soil was new turfy soil, rather sandy, and entirely unmanured. My little crop was dibbled in grain by grain early in March, and cut early in August; height of straw above 5 feet. Many roots approached near to the one I send in size, but I believe it to be the largest; and the fact, as you perceive (if worth anything), is a matter of ocular demonstration.—*Martin F. Tupper, Brighton.*

Destruction of Turnip Crops.—The Cotswold farmer has moved my sympathy. I ascribe the evil to the effect of the season, on a soft ill-aired soil, impregnated with an excess (?) of azotised manure. I am ignorant of the character of the soil in question, but have seen similar effects in like conditions. I beg to recommend the trial of some of the cheapest disinfecters. One lot might be moderately dressed with newly slaked lime, another with chloride of lime, a third with common salt, a fourth with a mixture of salt and nitre, a fifth with a mixture of sulphur, nitre, and salt. The nitre and salt may be in equal weights, and 1 lb. of sulphur to 50 lbs. of the mixture. I would try these mixtures on small lots at first; give only about one cwt. of each dressing (except the lime) to the acre, and watch their effects. I could mention many others, but their price forbids field use. If anything better occur to any reader, state it, and let us soon hear whether that malady is giving way.—*G.*

Lucerne.—I have grown Lucerne this year for the first time. I have had a capital crop, and have cut it twice. It promises to be high enough and strong enough for another cut. Do you advise it?—*J. M.* [Yes.]

Potter's Guano.—Having seen (page 629) what is represented by your correspondent as an analysis of "Potter's Guano," I think it only right, in justice to myself, and out of consideration to those who may be led to make the manure from the formula given, expecting that it faithfully represents the composition of my guano, to state that this is far from being the case. I do not wish to impugn the accuracy of Mr. Mason, with whose name, however, as an analytical chemist I am unacquainted; but he has, in this instance, either got hold of a spurious article, or an error has arisen from some other cause. As it is not my intention as yet to make the public a present of the secret of my composition, nor to be entrapped by the putting forth of pretended analyses to declare what the correct analysis is, I shall content myself, in reference to Mr. Mason's, by saying, that those who follow it, although they will succeed in forming a very tolerable manure, will be sadly disappointed if they think they can substitute it for my guano. I will conclude by remarking, that although the analysis in question fails to declare truly what Potter's Guano *is*, yet it affords a negative evidence, at least, that it is not composed of chalk, sand, &c., as some have asserted, and that it is free from that cheap commodity WATER, which farmers, it appears, are willing to buy to the tune of some 25 to 35 per cent. in the foreign guano, paying for the same from 8*l.* to 10*l.* per ton, with a trifle more for carriage to their farms.—*W. H. Potter.*

Vetches and Italian Ryegrass.—In reference to a previous article on this subject, I beg to inform you that I sowed per acre, broadcast, 2 bushels of Vetches, ⅔ ditto of Italian Rye-grass, 14 lbs. of Cow-grass, and 2 bushels of Oats.—*W. Courtis, Swansea.* [Sown, we presume, not as a mixture, but successively on the same land.]

Societies.

AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.

At the weekly meeting of the Council, on Thursday, September 5th, it was announced that his Royal Highness Prince Albert having been pleased to cause the sum of 50*l.* to be remitted, to be applied to the promotion of agricultural science in Ireland, this sum had been placed, by Lord Eliot, at the disposal of the Royal Agricultural Improvement Society. A letter was also read from Lord Stanley, from the Colonial Office, accompanying a specimen of seeds of the Tussac Grass, lately imported from the Falkland Islands. The following are the terms of a premium of 5*l.*, given by Sir Harry Verney, Bart., to be competed for in the county of Galway, and to be decided at the next great national Cattle Show of the Society, to be held at Ballinasloe, for the province of Connaught, in the year 1845, viz.: "To the landholder in the county of Galway, who, being neither owner nor occupier of more than two statute acres of land, and recommended by a member of the Central Society, shall obtain from his holding the largest quantity of produce (not more than one-eighth beir the Potatoes) during the year ensuing the mar Dublin." Royal Agricultural Improvement Soc the premiums The secretary stated, that new, amounting to near awarded at the late Cattle discharged, with the ex- 700*l.*, had been paid which were subject to the conditions ception of those ished; and that all the medals awarded above me occasion were now in preparation, and would be on the ready to be delivered to the parties, on application, in a few days.

SOCIETY FOR THE PROMOTION OF THE GROWTH OF FLAX IN IRELAND.

On Wednesday, 4th September, the monthly meeting of the Committee of this body was held at Belfast. The secretary read a Report of the quantity of Flax-seed imported into, and sown in Ireland, this season, prepared by a member of Committee, from the most authentic sources:—

FLAX-SEED IMPORTED INTO IRELAND, FOR SOWING, IN THE YEAR 1844.

Ports.	Riga brls.	Dutch hhds.	American hhds.	Total in hhds.
Belfast	20,123	2705	—	12,766
Derry and Portrush	23,063	900	200	12,630
Newry	—	—	—	8800
Dublin	—	—	—	2500
Limerick, Cork, and other ports ..	—	—	—	3500
Total ..	43,183	3605	200	40,196
Supposed quantity of home-saved seed sown				1200
				41,396
Deduct quantity on hands				500
Grand total of hhds. of Flax-seed sown this year ..				40,896
Total quantity sown in 1843				37,400
Increase over 1843				3496

From the above analysis of the importation this year, some interesting facts may be gathered. The quantity of American seed imported this season is only 200 hhds., while last year it was 4080 hhds. The decrease may be principally attributed to the strong manner in which the Society has cautioned the farmers against sowing American seed, which produces a branchy stem and coarse fibre. Home-saved seed has been sown extensively, and with success, many persons having very fine crops of Flax from it. It will be seen that Flax culture continues to increase in a steady progression. On the supposition that each hogshead would sow three statute acres, the quantity of land under the crop, in 1843 was 112,200 acres, and this year, 1844, is 122,688, an increase of 10,488 acres on the previous year. At the lowest average, each acre will produce 6 cwt. of clean scutched Flax; thus, the entire produce of Irish Flax last year was 36,465 tons, and this year, 39,611 tons—an increase of 3146 tons on the season's growth. The value of this 3146 tons, at 40*l.* per ton, which is a very low average, would amount to 125,840*l.* This large sum would otherwise have been paid to the Continental farmers, but is now retained in our own country. The superior elasticity and durability of Irish Flax over the Russian article is becoming daily more apparent, and the English spinners are more inclined to look to this country for their future supply. The committee resolved to allocate the sum of 50*l.*, in prizes for Flax and Flax-seed, at their Annual Show, in November this year, in addition to the 55*l.* already advertised as prizes, to purchasers of Flax on the foot.

FARMERS' CLUBS.

Wiltshire.—At the Annual Meeting of this Society, Mr. W. R. Browne, alluding to the condition of the agricultural labourers in Wiltshire, as compared with that of the labourers of some other counties, stated the average rate of wages in Wilts to be between 7*s.* and 8*s.* a week, and showed that, while there was a great redundancy of labourers, there were about 87,000 acres of uncultivated land in the county. He contended that if this land were, as it might be, brought into cultivation, the wages of the labourer would be raised, and his condition greatly improved; the poor-rates of the county, which now average 3*s.* in the pound—1*s.* above the average of England—would be diminished, and the welfare and happiness of all placed on a firmer basis. Mr. Browne referred, in proof of his assertion that the

waste lands he had alluded to were reclaimable, to the southern part of the county, where Mr. Brown, of Winterborne Stoke, and Mr. S. Mills, of Elston, had made the experiment, and had been amply repaid by the improved condition of their labourers, and the increased value of their property.—Mr. Mills corroborated the statement of Mr. Brown and observed:—As his name had been alluded to, as having converted some unprofitable soil to a good purpose, he would state that it had proved of great advantage to himself, as well as to the labourers throughout the county. He had of late adopted the system of stifle-burning, and this by mere chance. A man in his employ, who had come from a neighbourhood where it had been in operation, strongly recommended it. He consented to try it upon a piece of five acres; but before that was burned, he was so well satisfied of its advantages, that he ordered it to be tried on 80 acres. Those 80 acres had been valued by a highly respected surveyor at the annual rate of 1*s.* 6*d.* an acre. After the piece had been submitted to stifle-burning, crops of Turnips and Oats had been grown, that could not be exceeded on land for which 3*l.* an acre was given. —The process of stifle-burning is commenced by pulverising the land in the usual manner, namely, harrowing and rolling, so that the dead vegetable matter contained in the soil—as stubble, couch, or any kind of When—may be cleared of the mould as much as possible. by men or [illegible] is sufficiently dry, it is collected together tances, the more re[illegible] iron rakes into heaps at equal dis- soil. A small wad of do[illegible] spread the ashes and burned heap, and the earth is raked [illegible] is then added to each inches in thickness, before they are [illegible] the heaps a few flame is suffered to escape, and not much smo[illegible] No blaze or current of air being in some degree checke[illegible] The covering of earth, it becomes necessary to use from half a ton to a ton per acre of some sort of dry straw; that generally used is Wheat-straw. The last part of the process is spreading the heaps equally over the land. The whole is executed by men who travel from farm to farm for the purpose, at a cost of from 8*s.* to 14*s.* per acre.—*Bell's Weekly Messenger.*

Miscelianeous.

Sea-Weed as Manure.—The crops on the Isle of Thanet are superior to the crops grown in the inland counties; and, having travelled much by our railroads, I should say superior to any crops in the country. What is this superiority attributable to? There appears to be nothing very peculiar in the soil, and there is nothing peculiar in the rotation of their crops. I may be mistaken, but I attribute the superiority of the crops to the system of forming their dung-heaps, and the use of eaweed as manure. The farmers on the island form their dung-heaps with alternate layers of sea-weed and farmyard dung; and, after raising their heaps to the height of eight or ten feet, they cover the whole with a layer of eight or ten inches of sea sand. The sea-weed contains a portion of sea salt and fish, and on heating becomes very putrid and offensive. It may be difficult to analyse the compost of sea-weed and horse-dung, but it may be well to collect the liquor that oozes from the heaps, and have it analysed, when, I suspect, it will be found to correspond with guano in essentials. There is no doubt about its effect on the land, for the Wheat, in point of straw and ear, is so very superior that it cannot be improved in quality and quantity; and it only remains to be ascertained whether guano, or any other substance, in point of economy has any superiority. It is a mistaken notion to suppose that, by any contrivance, Wheat can be increased to any extent in a limited portion of land, or that more than a certain limited quantity of stalks of corn can be raised; every farmer knows that when stalks are too near together, they rot and decay. The great object to be sought is a healthy growth of straw, with a fine large ear, which shall yield a plentiful supply of good sound Corn; this result is attained on the island of Thanet. I was induced to inquire what was the cost of collecting the sea-weed on the island of Thanet, and was informed that the price paid at this season for it to the collectors of the weed was 6*d.* a cart-load in its wet state; this cart-load requires two strong horses to draw it, and may weigh considerably upwards of a ton; but when dry it may probably lose half of its weight, and much of its fertilising qualities. The farmers remove it in its wet state to their compost heaps, and do not lose the fertilising juices. I am induced to trouble you with these few observations, that our agriculturists may furnish employment to a very useful class of our subjects, who, in winter, have little or no employment—I mean the boatmen of our sea-ports, who would be too happy to collect the sea-weed, and deliver it at the terminus of our railroads at probably 6*d.* per ton; for this is the price paid by the farmers to the agriculturists in the island of Thanet in the summer season, when other employment is obtainable; and, of course, in the winter, when there is little or no work going forward, and when the sea-weed is deposited in the greatest quantity, from the sea being ruffled and stormy, our boatmen would be too happy to obtain the employment on the same scale of wages. I am of opinion that the sea-weed might be pressed, by the aid of machinery, into a convenient compass, to render its transport by our railroads and by our ships not very expensive; and when our merchants are sending their ships to the South Seas for guano, they would enter into the speculation of conveying the sea-weed from our island sand-roads if the cost of the freight from our sea coast to the terminus of our railroads leading into the interior of our island would be realised.—*Correspondent of Mark Lane Express.*

Notices to Correspondents.

RURAL CHEMISTRY.—By E. Solly, Esq., F.R.S. Experimental Chemist to the Horticultural Society of London, Honorary Member of the Royal Agricultural Society, and Lecturer on Chemistry at the Royal Institution, may be had of all booksellers, price 4*s.* 6*d.*

ALPACA.—*H. S.*—We see no reason to doubt their success on Chalk Downs. Their usual price hitherto has been from 20*l.* to 30*l.* each. Their price in Peru is from 3 to 4 dollars; so that if they could be imported without loss by death, they might be sold with a fair profit at a comparatively cheap rate. We do not know where any are for sale.—*Subscriber.* —Apply to Messrs. M. & E. Dawson, 15, Islington Terrace, Liverpool.

ASPHALTE ROOFING.—*P.*—It is perfectly suited for roofing farm or any other buildings; no paint or other coating is required; it is laid on a boarded surface; and, except when that can be cheaply obtained, it is therefore expensive. About Alpacas, see above.

BELGIAN CARROTS.—*Yeoman.*—Harvest them just before their leaves get too rotten to enable you to pull the root up by. This will be when some of the lower ones have turned yellow. Keep them between two rows of flaked hurdles about 6 feet apart, and piled up in a ridged form, and thatched.

CHURNING.—*Inon.*—This operation is most successfully effected when the milk or cream is preserved at a temperature of about 75° Fahr.

DIBBLING.—*S. H. H.* had better dibble two seeds in each hole, lest one should fall a prey to birds, &c.

DRILLING MACHINE.—*J. B. Swete.*—Mr. Newberry's address is Hook Norton, Oxfordshire.

ELDER-BERRY WINE.—*Nemo.*—We must refer you to "The British Winemaker and Domestic Brewer," a small octavo volume, by W. H. Roberts: Whittaker & Co., London. With regard to our articles on Agricultural Mechanics, we must beg you to exercise a little patience: we can only say that we differ from you in opinion as to what has already appeared on that subject. Thanks for your suggestion as to the mode on which these papers should appear. We had already resolved in adopting, *in part*, some such plan.

FARM IMPLEMENTS.—*T. Hudson.*—The land alluded to is situated in South Surrey. The Vernon hoe is a narrow, almost dart-shaped tool with a sort of swan neck, attached to a handle. It may be had, we presume, of implement makers, or perhaps seedsmen.

LIQUID MANURE.—*A Farmer.*—Putrid urine requires about 1 lb. of sulphuric acid to fix the ammonia in 5 gallons of it.

LUCERNE.—*G. B.*—It will be all the better for the liming. It is best sown in rows, and perhaps dibbled; but it is too expensive work to transplant it.

MANURE.—*Melibæus.*—You had better mix it with double its quantity of vegetable mould; or, if you have it not, with a mixture of ordinary earth and charcoal dust, and you can apply it most beneficially perhaps to a green crop, Turnips, Potatoes, or Mangold Wurzel, under the last furrow which the land receives before the seed, at the rate of three cart-loads of the mixture per acre. It is not probable that the calcareous sand of which you send a specimen would benefit your clay; but as it is impossible to speak with certainty, you might try it on a piece of arable land, at the rate of one cubic yard on four perches of land.

POTATOE HAULM.—*Three year-old Subscriber.*—The removal of leaves such as cattle would relish as food would injure any plant that it is proposed to strip. You are mistaken in supposing that the young tubers might be exhausted in the effort to ripen the leaves; it is the agency of the leaf that ripens the tuber; and as long as they are green they are thus useful to the crop.

POTATO FAILURE.—*W. Ewing.*—Your report of the discussion is not sufficiently different from what has already appeared, to justify its publication. Will you favour us with your own views on the subject.

PROPER TIME TO REAP WHEAT.—*J. C. X.*—Thank you. A paper has been sent to the address you name.

SALT.—*Lapis.*—It can only be of use to the plants in solution; but you will find it cheaper to let it dissolve naturally, by sowing it in wet weather, than to apply it by means of the water cart. Gas-water may be applied on meadow-land by means of the water-cart; apply 300 or 400 gallons per acre.

SEED WHEAT.—*Improver.*—No charge is made.

SELF-SUPPORTING SCHOOLS.—*Subscriber.*—Mrs. D. Gilbert of Eastbourne, Sussex, has established several. We are not aware if there be any in the neighbourhood of Nottingham.

SPRING TARES.—*A Subscriber.*—It depends on the nature of the season. We think you may risk them.

TANK.—*Joe* has had a tank made with bricks upon arches, and made level with concrete, and about two months after it was quite dry he had one inch of Roman cement mixed with half washed road grit put over the bottom and side, and when that was set and hard he put the water in, and now it is leaking all over the bottom. How is he to *stop it?*

WILD DUCKS.—*Kent* asks if any of our correspondents can inform him whether wild ducks pair off, or what number of drakes are required to 20 ducks? Also whether the swan will destroy trout?

*** As usual, many communications have been received too late.

Markets.

SMITHFIELD, MONDAY, Sept. 16.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3*s*	8 to 4*s*	0	Best Downs & Half-breds	3*s*	8 to 4*s*	0
Best Short Horns	3	6	3	10	Best Long-wools	3	8	3	10
Second quality Beasts	2	10	3	4	Ewes and second quality	3	0	3	6
Calves	3	4	4	0	Lambs	3	8	4	4
Pigs	3	4	4	0					

Beasts, 3656; Sheep and Lambs, 33,960; Calves, 144; Pigs, 331.

We have to-day a large increase from last week in the supply of Beasts, and a consequent dulness in the trade, with a disposition to lower prices; although we cannot make alteration in our quotations for the best qualities, yet those prices are with difficulty obtained, and in some instances fail to be realised; several interior Beasts remain unsold. Our supply of Mutton continues nearly the same; there is considerable activity in the trade for Longwools and the best Downs, but a remarkable dulness in the demand for Half-breds; the prices of the two former qualities are a shade better, the best Downs making rather over 4*s*, and the best selling Longwools a little more than 3*s* 10*d* per 8 lbs, but Half-breds scarcely reach the latter price. Good Lamb is in demand at late prices. Veal is about the same. Pork is rather lower.

FRIDAY, Sept. 20.

The supply of fresh Beasts is not very large to-day, and the prices of Monday are fully maintained—some of the choicest qualities realise a little more money. The trade for Mutton is very dull, but we cannot notice any alteration from Monday's quotations. The demand for Lamb is not quite so good; they make about the same as of late. There is a little more briskness in the Veal-trade, but the choicest make very little over 4*s* per 8 lbs. Pork-trade is very heavy; it is difficult to make 4*s* of neat Porkers.

Beasts, 787; Sheep and Lambs, 8160; Calves, 286; Pigs, 330.

41, West Smithfield.

HOPS, FRIDAY, Sept. 20.

We have now a good supply of new Hops at Market, the demand for which is good. At Worcester Fair yesterday, about 2000 pockets were pitched; the greater part sold from 6*l* 6*s* to 7*l* 7*s*. The duty for that district is called 17,000*l*, and for the Kingdom 130,000*l*. New Sussex, 6*l* 10*s* to 7*l*; Weald of Kent, 7*l* to 8*l* 8*s*; Mid Kent and Farnhams, 9*l* 9*s* to 10*l* 10*s*.

FATTENDEN & SMITH, Hop-Factors.

WOOL.—BRITISH, FRIDAY, Sept. 20.

Our Wool Market remains unaltered from our last Report.

COVENT GARDEN, SEPT. 21.—The market has been well supplied with both Fruit and Vegetables during the week, but trade has been far from brisk. Pine-apples are [illegible] tiful, and many handsome fruit are offered at from 3*s*. [illegible] per lb. The price of Grapes is rather on the decline [illegible] Black Hamburghs are selling at from 1*s*. to 2*s*. 6*d*. [illegible] There is no difference in the price of Melons since our last Report. Peaches and Nectarines still continue good, and are sufficient for the demand. Few Greengages are to be met with, and the supply of Dessert Plums is chiefly confined to Coe's Golden Drop, the price of which is from 6*d* to 1*s*. per punnet. Damsons are still offered at the prices quoted in our last Report. Figs are becoming very scarce; they are selling at 3*s*. per dozen. Apples and Pears remain at nearly the same prices as last week. Filberts are scarce, and are to become dearer; Oranges are also becoming very scarce; Lemons are tolerably well supplied, and a considerable quantity of [illegible] Walnuts are in the market. Vegetables have not altered much since our last report; Cauliflowers are offered at nearly the same prices as stated last week; Broccoli is good, and sufficient for the demand; and Cabbages and Colewort's are abundant. French Beans are rather on the rise; Onions are good and plentiful, and Carrots and Turnips are abundant; Tomatoes are rather cheaper; Lettuces, Endive, and other salading, are sufficient for the demand. Cut flowers chiefly consist of Gladiolus psittacinus, Combretum purpureum, Gardenia radicans, Heaths, Camellias, Amaryllises, China Asters, Pelargoniums, Fuchsias, Verbenas, Carnations, [illegible]

FRUITS.

Vegetable Marrow, per doz., 4*d* to 1*s*	Chervil, per punnet, 2*d* to 3*d*
Spinach, per sieve, 1*s* 6*d* to 2*s*	Chilis, per 100, 1*s* 6*d* to 2*s*
Leeks, per bun., 2*d* to 3*d*	

MARK-LANE, MONDAY, Sept. 16.

THE supply of Wheat from Essex this morning was moderate, that from Kent and Suffolk large; the first was taken off at the prices of last week, but that from the two latter counties barely supported those rates. Having a fair attendance of country buyers, Foreign Wheat met a slightly improved demand, but we are unable to raise our quotations, excepting for the finest qualities of new.—English Malting Barley must be written 1*s*. to 2*s*. per qr. cheaper; Foreign for grinding cannot be taken off at late terms.—New Beans sold 1*s*. below those which have hitherto appeared; old are unaltered in value.—Maple and Grey Peas have declined fully 1*s*. per qr.; White remain the same.—There was a fair show of Oats, including a few new Irish, the quality of which was moderate only, and great difficulty experienced in their disposal; old also sold slowly, but last week's prices were fully supported for Scotch.—Winter Tares are 6*d*. to 1*s*. per qr. lower.

KINGSFORD AND LAY.

BURBIDGE AND HEALY'S NEW BOILER and FURNACE for HORTICULTURAL PURPOSES.

Registered under 6 & 7 Vict., Cap. 65.
No. 130, FLEET STREET, LONDON.

BURBIDGE and HEALY respectfully inform the Horticultural Public that they have constantly on hand an extensive assortment of their new Boiler and Furnace Doors. In very numerous cases where they have been fixed, they have the highest testimonials of their complete success: for the further assurance of those who may require this apparatus, BURBIDGE and HEALY refer them to the Horticultural Society's Gardens, Chiswick; also to Mr. GLENDINNING, Garden Architect, &c. &c., Chiswick Nursery, in the same neighbourhood, where the apparatus may be seen in successful operation, in connection with their new Tanks. The following are the present prices:—

Plain Boiler.	Patent Door and Frames.	Fire-bars & Dead Plate.	Flue Door.	Damper.	Will heat of Pipe.	Forcing Fit, Length by feet.
in.	£ s.	£	s. d.	s. d.		
10	1 5	20	7 6	6 6	2 6	12 to 20
Ribbed Boiler.						
10	2 2	20	10 6	7 6	2 6	50 to 70 ft. 4 in. Under 25 to 40
12	2 15	30	12 6	7 6	3 6	80 to 125 feet. 40 to 65
14	3 10	35	17 5	8 6	4 6	150 to 250 feet. 65 to 100
18	5 5	42	25 0	8 6	5 6	300 to 400 feet. Warm a grapery 35ft. long, and a pit 50ft.
21	8 15	50	35 0	8 6	7 6	600 to 800 feet.

If 3 inch pipe be used, one-third more. If 2-inch pipe, as much more.

The above quantities are rough estimates, which may be varied by enlarging or contracting the fire, or by regulating the fire door. It is possible to heat a much larger quantity of pipe with the boiler, but it would be done at great loss of fuel. The above proportions can be generally relied on as a near approximation to what is correct.

COTTAM AND HALLEN, ENGINEERS, IRONFOUNDERS, &c., &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT or ROGERS'S BOILERS. After 15 years' experience, and having fixed upwards of 2000 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale.

Materials may be had for those who wish to fix their own Apparatus.

THE TANK SYSTEM on an improved principle, that will heat the house at the same time, without pipes.

IRON HURDLES, best Wire for Strained Fencing, Ornamental Iron and Wire-work, Garden Chairs, &c., &c., and every description of Implement for AGRICULTURAL and HORTICULTURAL PURPOSES.

Show Rooms at their Manufactory, 2, Winsley-street, Oxford-street, where a large assortment of the above can be seen.

GUANO (GENUINE PERUVIAN & BOLIVIAN.

ON SALE, BY THE ONLY LEGAL IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
WM. J. MYERS AND CO., LIVERPOOL;
And by their Agents,
COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, Sept. 20, 1844.

GUANO for SALE, in Bags of 1 cwt. each, just landed, with a succession of cargoes to arrive.—Successive years' experience has unquestionably proved that Genuine Guano is the simplest, cheapest, and best Manure within the reach of the Agriculturist. The only reasonable anxiety which now remains is to procure the Guano unadulterated, and to obtain such practical directions for using the Manure as shall fully develop its productive powers. To secure to buyers these indispensable requisites, with each purchase will be given a warranted chemical analysis of quality, and also a copy of the recently published Pamphlet, "Practical Instructions for using Guano as a Manure, illustrated by Practical Results."

Large parcels will be delivered direct from the ship or waterside premises; smaller quantities may be had at the warehouses, 24 and 25, Billiter street, or delivered within any reasonable distance at a trifling additional cost. Apply to JAMES CLARK, 24, Billiter-street.

WHEAT-SOWING.

GUANO; Genuine Peruvian, Bolivian, and Ichaboe, on Sale; also Potter's Guano, Gypsum, Sulphuric Acid, Sulphates of Iron and Copper, and all other manures. Synopsis of prices, and mode of use, on application, &c.—Apply to MARK FOTHERGILL, 40, Upper Thames-street.

MANURES.—The Readers of the *Gardeners' Chronicle* must have noticed the complaints constantly made there of the Adulterations of Manures, and which are now carried on to a fearful extent.

The Advertiser, a Broker of the City of London, and in daily communication with several scientific Chemists, calls the attention of the Nobility, Agriculturists, and Farmers to his method of supplying Manures, by which a genuine article is secured. Each article is Analysed, and the Analysis forwarded to the purchaser, who can by this means obtain redress should the article differ from the Analysis.

Terms, Cash and one per cent commission for buying and forwarding.

A register will be kept of the Analysis of every cargo of Guano imported into London that is brought in the market.

Price-current, London, Sept. 19, 1844:—

Bones	p. ton	£4	10s.	0d	Nit. of Potash	p. cwt.	£1 4s. 6d

WM. NORTHCOTT, 13, Rood-lane, Fenchurch street.

SEED-WHEAT. — Any one desirous of obtaining Seed-Wheat for use this autumn, may ascertain, by application to me, the particulars of the crops of two excellent varieties—Shirreff's Hopetoun, and Morton's Red-Straw White, which have been grown on

WHITFIELD FARM, THORNBURY, GLOUCESTERSHIRE, during the last 3 years. This year's crop is on sale at 8s. a bushel —JOHN MORTON, Whitfield.

SEED WHEAT.

J. D. PIPER, of Colne Engaine, Essex, (Member of the Royal Agricultural Society), has been four years raising two new Stocks of Wheat, viz., Piper's "Thick-set," and "Colne Whitechaff Red." At the last Southampton Meeting two sheaves of these Wheats were exhibited outside (notice not having been given in time for their admission inside), where they produced much excitement, and 6d. per ear was offered for them. Last year, in the same field, side by side, the Piper's Thick-set grew eight bushels and a half, and the Colne Whitechaff Red five bushels and a half more per acre than the most prolific Wheat grown in the neighbourhood. Last autumn J. D. P. measured a quarter of an acre off his field, and dibbled the Thick-set in rows a foot apart, and one bushel per acre; and though the plant was partially destroyed by the slug in the winter, and a good sprinkling of self-sown Potatoes were left to grow, still the yield was 14 bushels and a half, being equal to 14 sacks and 2 bushels per acre. One person this year grew 13 sacks and 2 bushels, another 14 sacks, and another 13 sacks per acre. One parcel weighed 64½ lbs. per bushel. This is, perhaps, the stiffest-strawed Wheat in England, and is adapted for strong or hollow bottom ground, and is not likely to get laid. J. D. P. will send to London, or to any place within ten miles of Colne, carriage free, and he will be glad to receive a post-office order, or reference to some house in London for the money, with the order for the Wheat. When it is all sold, J. D. P. promises to inform the Public, by an advertisement in this Paper; but if he should get any post-office orders after it is all sold, he will return them. The price is regulated according to the yield. Thick-set, 15s. per bushel; Colne Whitechaff Red, 9s per bushel. Samples of the above, both threshed and in the straw, may be seen at our Office. N.B.—J. D. P. advertised in the two principal papers in Essex, where the above Wheat was growing, in order that Agriculturists might see it and judge for themselves of the quality and quantity.

WHEAT SOWING.

FREDERICK BRAIN begs to call the attention of the Agricultural world to his GUANO MANURE, prepared expressly for Wheat crops: it abounds in all the ingredients that are necessary for a good grain crop. He particularly solicits persons who found the Foreign Guano a failure last season to give his a trial, it being much more powerful, and free from adulteration, so justly complained of in the Foreign by Agriculturists, as well as by all the leading Agricultural Journals.

Testimonial to Brain's Guano Manure.—"5 A, Hawley Road, Kentish Town, London, Aug. 15, 1844.—This is to certify that we have subjected Brain's Guano to a most patient and rigorous analysis, and find it contains all the necessary constituents of a good manure, and is well calculated to give fertility to a soil which is either naturally barren, or has been exhausted by over-cropping, by supplying the land with those substances which are absolutely requisite to a healthy vegetation: it is not adulterated, and can always be depended on, being of uniform composition.)—(Signed) JOHN MITCHELL and FREDERICK FIELD, Analytical Chemists, of the Royal Polytechnic Institution, London."

Also, BRAIN'S highly concentrated LIQUID GUANO, for Grass Lands, Gardens, Shrubberies, Hothouses, and Conservatories, price 1s. 9d. per quart bottle, with full directions for use, (enough for 80 gallons of Liquid Manure), to be had of most respectable Florists, Seedsmen, and Chemists in town and country.

Works, Thomas-st., Duke-st., Stamford-st., Blackfriars-road.

TO AGRICULTURISTS.

CAMPBELL'S CORN STEEPS.—The Material for Wheat is on Sale by the undermentioned Agents, at 2s. 6d. per gallon.

Notwithstanding the extreme drought of the last spring and summer, the results of the experiments, in very many instances, have been surprising, averaging a saving on seed, in the first instance, of 3s. per acre, and yielding a produce of 20 per cent. additional in straw, and 40 per cent. in grain. Had the season been more moist the result would have been at least double.

From Report of the Judges, Glasgow Cattle Show, Aug 7, 1844.

"Among the remaining articles of the Exhibition (of Roots, Seeds, &c.), the Judges would direct attention to a series of specimens exhibited by Mr. James Campbell, of Dundee, consisting of various Grasses (they were Wheat, Barley, Naked Barley, and Oats), raised from Seed steeped in a Fertilising Liquid. These were contrasted with others which had not undergone the process, and were in all cases decidedly superior."

Agents:—Messrs. G. Gibbs, 26, Down street, Piccadilly; Thos. Gibbs, corner of Half-moon-street, Piccadilly; and Edw. Purser, 40, New Bridge-street, London. W. E. Rendle, Plymouth Manure Company; J. Campbell, 5, Mersey street, Liverpool; P. Bruce, Merchant, Hull; Crouch and Co., 66, Close, Newcastle-on-Tyne; W. F. Karkeek, Truro; John Mayer, High Offley, Staffordshire; George Griffith, Bewdley; J. B. Haden, Warminster; Phillips and Whittem, Coventry; John Towers, Maidenhead; Samuel Waldie, Carlisle; John Rodway, Carmarthen; James Black and Co., Aberdeen: W. Campbell, Merchant, Wick; Wm. Cuthbertson, Printer, Annan; J. and D. Campbell, Thurso; Maxwell Dick, Irvine; Dickson and Turnbull, Perth; Drysdale and Co., Glasgow; Drummond and Sons, Stirling; Wm. Dalrymple, Cupar Angus; John Dykes, Kilmarnock; James Haldane, Lauder; J. Bell, Dundee; Thos. Kennedy, Dumfries; A. Kennedy, Thornhill; P. Lawson and Son, Edinburgh; Wm. Low, Forfar; A. M'Farlane, Kinross; John Ogg, and Shield and Co., Arbroath; Geo. Robertson, jun., Kirkwall; John Rae, Elgin; A. Simpson, Macduff; A. B. Telfer, Ayr; Wood and Co., Stonehaven.

IMPORTANT TO AGRICULTURISTS, &c.

ANALYSES of SOILS, MANURES, and all AGRICULTURAL PRODUCTS, are conducted by Messrs. MITCHELL and FIELD late Mr. Mitchell, Analytical Chemists, with the view of ascertaining whether the soil, in which it is proposed to grow any particular crop, contains all that is necessary to produce a luxuriant vegetation; also to estimate the relative value and purity of Manures, and the comparative worth of Farm Produce in general. Gentlemen instructed in Agricultural Chemistry. The course will comprehend the Elements of Analysis.—No 5A, Hawley-road, Kentish Town.

TO COLONISTS, EMIGRANTS, &c. — Mrs. MARY WEDLAKE, widow of the late THOMAS WEDLAKE, at 118, FENCHURCH STREET, CITY, informs Emigrants and others that she continues to manufacture those Agricultural Implements for which her late husband was so extensively patronised by the Settlers of South Australia, Van Diemen's Land, Swan River, New Zealand, and other British Colonies. The following articles, made in a very superior manner, are kept on sale at the London Warehouse, viz.:—

Patent Hay making Machines	Flour Mills—Bean Mills
Dressing Machines	Patent Essex Ploughs, 30 sorts
Patent Chaff-cutting Machines	Subsoil Ploughs [Colonies
Oil-Cake Crushers	Threshing Machines for the
Double action Turnip cutters	Drills of all kinds—Scarifiers
Railway Wheels	Vacuum Pumps

Please to be particular in the address, MARY WEDLAKE, 118, Fenchurch-street, London.

HATCHER'S BENNENDEN TILE-MACHINE, Manufactured and Sold only by COTTAM and HALLEN, Engineers, Agricultural Implement Makers, &c., 2, Winsley-street, Oxford-street, London.

This is the most efficient Machine that has been invented for the purpose of making Drain Tiles. Any shaped Tile can be made by merely changing the die, which can be done in a few minutes. It requires but few hands, viz., one man and three boys. With this amount of labour, the product of a day of 10 hours is as follows, viz.:—

1 inch diameter of Tile,	11,000	1¾ inches diameter of Tile,	5,800
1¼ ,, ,, ,,	8,000	2¼ ,, ,, ,,	3,200

The Machine is movable down the drying-sheds, so that it requires no extra boys to carry the Tiles, nor are shelves required in drying. It has been in full operation for upwards of four months at Hempstead Park, near Cranbrook, Kent. No charge made for Patent dues or licence. The purchase of the Machine includes free use of it.

J. R. AND A. RANSOME, Ipswich, have published a Descriptive Catalogue, with Cuts, of their AGRICULTURAL IMPLEMENTS and MACHINES, which may be had by post, the order being accompanied by six penny stamps.

70, STRAND, LONDON.

RAMS FOR RAISING WATER WITHOUT LABOUR, where a fall can be obtained. FOUNTAIN BASINS IN IRON, &c.

F. ROE having purchased all the Patterns of Basins, Jets, &c. formerly belonging to W. Rowley, Fountain Maker to the Royal Family, is enabled to offer the above article in Iron, which will stand the Frost and last for ages. A Ram and Fountain Jets fixed on the premises for inspection. Every kind of Garden and other Pumps, Well Engines, Baths, &c. Houses, &c. Heated by Hot Water.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient Protective Material to Plants, and is now in use at the Royal Horticultural Society's Gardens, Chiswick. It can be had of any length, 32 inches wide, at 1d per foot, super. A discount to the trade. THOS. J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S  ROYAL LETTERS PATENT.

TO GARDENERS, NURSERYMEN, AND OTHERS.

F. M'NEILL & CO., of Lamb's Buildings, Bunhill-row, London, Manufacturers, and only Patentees of IMPROVED PATENT ASPHALTED FELT, for Roofing Houses, Sheds, Verandahs, &c., and for Protecting Plants, and Covering Garden Frames, beg to call the attention of Gardeners and others to their superior article, which has been exhibited at the Great Agricultural Shows of England, Scotland, and Ireland, and OBTAINED the PRIZE for being the best and cheapest article for roofing, &c. It has been tested in the gardens of several noblemen and gentlemen in the neighbourhood of London, and in different parts of the country, to whom reference can be made. The Felt is impervious to rain, snow, and frost, and a non conductor of heat and sound. Its advantages are Lightness, Warmth, Durability, and Economy.—Price ONLY ONE PENNY PER SQUARE FOOT.

Samples, with directions for laying on, and testimonials as to its merits, sent free to any part of the town or country.—Patent Felt Works, Lamb's Buildings, Bunhill row, London.

TERRA COTTA FIGURES, VASES, FOUNTAINS, &c. Manufactured by DOULTON and WATTS, LAMBETH POTTERY, High-street, Lambeth, London.

D. and W., from their experience as Potters, have made considerable improvements in the manufacture of Terra Cotta, the superiority of which over Artificial Stone or Cement is well known. It is subjected to a high degree of fire, which renders it impervious, and gives it a sharpness and surface which no changes of temperature can impair.

D. and W. are enabled to offer the Terra Cotta at a considerable reduction in price; and Drawings and Designs will be forwarded Gratis, on application.—Architectural work executed.

THE WORKS OF G. P. R. JAMES, ESQ.

On the 1st October will be published the second volume of the NEW and ILLUSTRATED EDITION of Mr. JAMES'S WORKS, comprising the whole of the celebrated Historical Narrative entitled

MARY OF BURGUNDY.

This new and attractive series commenced on the 1st July with "THE GIPSY" (of which a second edition has already been required). The future Volumes will be published quarterly, each containing a complete Work, price only 8*s.* (originally published in three volumes at 31*s.* 6*d.*) The whole of this Edition has been carefully Revised by the Author, and "is got up in that superior style and agreeable size of type, &c., which render it fit for any age and for every library."

Published by SMITH, ELDER, and Co., London, and may be had of every Bookseller in the Kingdom.

THE HORTICULTURAL MAGAZINE.—On the 1st October will be published, price 1*s.*, the Introductory Number of the new Periodical. Orders received by all Booksellers. Contents:—Science of Gardening; Advantage of a Garden; Annals of Floriculture; Manure, and its Application; New Flowers; Fruits and Vegetables; Landscape Gardening; Planting; Improving Estates; Grafting; Acclimatising; Irrigation; Wonderful Vegetable Productions; the various Classes of Plants; Hybridising Plants and Vegetables; Designs for Conservatories; Gardening for Manufacturing Towns; Construction of Fountains; Substitutes for Glass; Lawns and Shrubberies; Fruit-Gardens and Orchards; Geology; Soils; Notes to Correspondents, &c.

T. HOULSTON, Publisher, 154, Strand, London.

NEW WORK ON AGRICULTURAL CHEMISTRY.

This Day is Published in One Volume, post 8vo,

LECTURES TO FARMERS ON AGRICULTURAL CHEMISTRY. By ALEXANDER PETZHOLDT.

Printed for TAYLOR AND WALTON, 28, Upper Gower Street.

NEW WORK BY PROFESSOR LIEBIG.

This Day is Published in fcap. 8vo,

FAMILIAR LETTERS ON CHEMISTRY.—*Second Series.*—The PHILOSOPHICAL PRINCIPLES AND GENERAL LAWS OF THE SCIENCE. By JUSTUS LIEBIG, M.D., F.R.S., Professor of Chemistry in the University of Giessen. Edited by JOHN GARDNER, M.D., Member of the Chemical Society.

Printed for TAYLOR AND WALTON, 28, Upper Gower Street.

COMPLETION OF THE BOOK OF THE FARM.

Next week will be published, price 8*s.*, Parts XX. and XXI. completing the Work, of

THE BOOK OF THE FARM,

By HENRY STEPHENS, F.R.S.E.

ILLUSTRATED WITH WOOD ENGRAVINGS.

At same time will be published,

The SECOND and THIRD Volumes, handsomely bound in cloth.

WILLIAM BLACKWOOD & SONS, Edinburgh and London.

JOHNSON'S GARDENERS' ALMANACK FOR 1845, will be published by the Stationers' Company in November. All Advertisements must be sent before November 1.

N.B. The Eighth Edition of the Almanack for 1844 having been entirely sold off, a Ninth has been printed for the supply of those who, beginning to take it in 1845, may be desirous of having the work from its commencement; but as it cannot again be reprinted, the public are warned that as the number is very limited the application for it should be immediate.

Just published, the Thirteenth Edition, price 2*s.* 6*d.*; free by post, 3*s.* 6*d.*,

THE SILENT FRIEND ON NERVOUS DEBILITY, CONSTITUTIONAL WEAKNESS, &c. By R. and L. PERRY and Co., Surgeons, London. Published by the Authors, and sold at their residence; also by Strange, 21, Paternoster-row; Noble, 109, Chancery-lane; Crocker, 1, Milford-lane, Strand; Ward, 103, Strand (opposite Exeter Hall); Gordon, 116, Leadenhall-st.; Purkiss, Compton-st, Soho; Wilson, 338, Oxford-st. (two doors from Argyll-st.), London. The Cordial Balm of Syriacum is a stimulant and renovator in all Spasmodic complaints. Nervous Debility, Indigestion, Asthma, and Consumption, are gradually and imperceptibly removed by its use, and the whole system restored to a healthy state of organisation. Sold in bottles, price 11*s.* and 33*s.* PERRY'S Purifying Specific Pills have long been used as the most certain remedy for Scorbutic Complaints of every description, Eruptions of the Skin, Pimples on the Face, and other disagreeable affections, the result of an impure state of the blood. These Pills are perfectly free from mercury and other deleterious drugs, and may be taken with safety without interference with, or loss of time from business, and can be relied upon in every instance. Sold in boxes, at 2*s.* 9*d.*, 4*s.* 6*d.*, and 11*s.*, by all Medicine Venders.

Messrs. PERRY and Co. may be consulted daily at their residence, 19, Berners-street, Oxford-street, from 11 till 2, and from 5 till 8. On Sunday, from 10 till 12.

HORTICULTURAL SOCIETY OF LONDON.

This Day is Published, price 3*s.* 6*d.* to Fellows of the Society, and 5*s.* to others.

A CATALOGUE OF THE FRUITS Cultivated in the Garden of the HORTICULTURAL SOCIETY OF LONDON. Third Edition. Sold by LONGMAN & Co., Paternoster-row; J. HATCHARD, Piccadilly; RIDGWAY, Piccadilly; RIVINGTONS, Waterloo-place; and by the principal Booksellers in all parts of the Empire.

A few copies of the Second Edition of this Catalogue may be had at the reduced price of 1*s.* 6*d.* each.

Price Sixpence, free by post.

The Railway Chronicle

Of SATURDAY last, SEPTEMBER 14, contains

THE WESTMINSTER REVIEW and the RAILWAYS—The SOUTH-EASTERN and DOVER MEETING and the CARRIER QUESTION—The BOARD of TRADE and the NEW RAILWAY PROJECTS, with the Official Notice—CHEAP FARE EXCURSION TRAINS.

THE ATHENÆUM,

JOURNAL OF ENGLISH AND FOREIGN LITERATURE, SCIENCE, AND THE FINE ARTS.

Twenty-four Large Quarto Pages, PRICE FOURPENCE,

Or Stamped, to go free by post, 5d.

Reviews OF, WITH EXTRACTS FROM—

Spain and the Spaniards in 1843, by Capt. Widdrington
The Septuagint Version in English, translated by Sir L. C. Brenton, Bart.
Eöthen, or Traces of Travel brought home from the East.
Commerce of the Prairies, or Journal of a Santa Fé Trader, by Joseph Gregg.
False Science and its relation to Life, by J. G. Von Wessenbergh.

WITH SHORTER NOTICES OF THE FOLLOWING:

Description of the Skeleton of an extinct Gigantic Sloth, by Richard Owen.
Practical Grammar, by G. J. Holyoake.
The Arithmetic of Annuities, by Edward Baylis.
Arithmetical Questions, by W. M'Leod.

Original Papers.—REPORT OF THE BRITISH ARCHÆOLOGICAL ASSOCIATION, Meeting at Canterbury.—ON EXPLOSIONS AND EXPLOSIVE COMPOUNDS.

Foreign Correspondence.—Letter from Campo Dolcino, giving an account of a dreadful Storm on the Splugen.

Our Weekly Gossip.—Notices of Motions in the House of Commons for next Session as regards Art and Public Parks, &c.—Sir Robert Peel's Donation to Manchester; the Duke of Norfolk's to Sheffield—Sir Richard Westmacott's Monument to the Duke of Cleveland—Thorwaldsen's Esculapius—Mr. Baily's Graces—Cassini's Statue—Death of M. Dyncke—The Scientific Congress of France—The Jubilee at Königsberg—MM. Bravais and Martin's Ascent of Mont Blanc—Exploration of the river Falémé—Trial as regards a French MS.—Liszt at Toulon, &c.

Societies.—The Horticultural.

Fine Arts.—Third Report of the Commissioners on the Fine Arts—Mr. Hallam and Lord Mahon's Correspondence—On the Principles which may regulate the selection of subjects for Painting in the new Houses of Parliament—Mr. Eastlake on the same subject, "with reference to the nature and various styles of the Formative Arts."—The Durham Memorial Temple.

Miscellanea.—Paris Academy of Sciences.—The Distribution of Prizes at the French Academy—Bridge at Warsaw—M. de Savigny.—Novel Treatment for the Cure of Consumption.

Order The Athenæum of any Bookseller or Newsman.

ADVERTISEMENTS IN THE MONTHLY JOURNAL OF MEDICAL SCIENCE, Edited by Dr. CORMACK. Few Periodicals present such advantages to the Advertisers of Medical and Scientific Publications, Works in General Literature, Medical Practices, Chemical Products, Pharmaceutical Preparations, the Prospectuses of Life Insurance Societies, &c. The circulation is large, and has from its commencement gone on steadily increasing in Great Britain, Ireland, India, America, and the Continent of Europe. It is taken in by many General News-rooms, by almost all of the Reading Clubs and Medical Societies in Town, and by a very large proportion of Country Practitioners, in England, Scotland, and Ireland, to whom, from its cheapness and comprehensive character, it is specially adapted. Advertisements inserted in this Journal must be seen by many thousands of the most select class of readers.

*** For the SCALE OF CHARGES, and all other particulars, reference may be made to Mr. Churchill, Princes-street, Soho, London; Messrs. Maclachlan, Stewart, and Co., South-bridge, Mr. Jack, Niddry-street, Messrs. Harthill and Son, Waterloo-place, and Mr. Seton, Head of the Mound, Edinburgh; Messrs. Fannin and Co., Dublin; most News Agents in Great Britain; and Messrs. Fortin, Masson, et Cie, Paris.

On the 1st of October, in demy 8vo, price 6*s.*,

THE NEW QUARTERLY REVIEW (No. 2); and HOME, FOREIGN, and COLONIAL JOURNAL, being the 8th Number of the FOREIGN and COLONIAL QUARTERLY REVIEW.

London: JOHN CHURCHILL, Princes-street, Soho; and may be had of all Booksellers and Newsmen.

AGRICULTURE, COMMERCE, NAVIGATION, the CHURCH.—A. B. SAVORY and SONS, GOLDSMITHS, 14, Cornhill, London, opposite the Bank, have finished a few Splendid Pieces of PLATE, suitable for Presentation to Gentlemen connected with either of the above pursuits or professions, to which they invite the attention of committees who are in search of valuable testimonials for such occasions.

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June 6*, 1844.—The cabin of the Great Western has been regularly supplied with LEA & PERRINS's Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers for its capital flavour, and as the best accompaniment of its kind for a voyage. (Signed) JAMES HOSKEN."

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup: giving a zest far superior to the long-established favourites; more wholesome and of less cost."—*Naval and Military Gazette*, April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS, Worcester; Messrs. BARCLAY and SON, Farringdon-street; and the principal Oil and Italian Warehousemen in London, and Retail by the usual venders of Sauces.

REAL SHEFFIELD PLATED DISH COVERS, at prices hitherto unattempted. THOMAS WEST, 18, Ludgate-street, London, having received a large supply direct from the manufactory at Sheffield, offers the best Meat Dish Covers as follow:—Cottage Pattern—1 Cover of 20 inches, 3*l.* 19*s.*; 1 do. of 18 inches, 3*l.* 3*s.*; 2 do. of 14 inches, 4*l.* 8*s.*; the set of 4, complete, 11*l.* 10*s.* ONLY. Double Dome Pattern—1 Cover of 20 inches, 4*l.* 16*s.*; 1 do. of 18 inches, 3*l.* 19*s.*; 2 do. of 14 inches, 5*l.* 5*s.*; the set of 4, complete, 14*l.* ONLY. In noticing the prices of the above goods, T. W. ventures to assert they are superior to many advertised at a much higher price. SATURDAY, SEPTEMBER 21, 1844.

VICTORIA LIFE ASSURANCE COMPANY.—
Trustees.—Sir Jas. Duke, Ald., M.P., Chairman.
Benjamin Hawes, Esq., Deputy Chairman.
Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.

Advances made to assurers on real or undoubted personal security, for terms of years, re-payable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary.

WILLIAM RATRAY, Actuary and Secretary.

BRITISH MUTUAL LIFE ASSURANCE SOCIETY,
17, NEW BRIDGE STREET, BLACKFRIARS.

Directors.

John Atkinson, Esq., Well-st., Hackney.
Joshua Burgess, Esq., Park-st., Grosvenor-square.
George Godwin, Esq., F.R.S., F.S.A., Pelham Crescent, Brompton.
Captain C. Twisleton Graves, Army and Navy Club.
Nutter Gray, Esq., Hackney.
Thomas Hamber, Esq., Barnsbury Park.
John Lodge, Esq., Portman-st., Portman Square.
Robt. Remmett, Esq., Temple.
John Richards, Jun., Esq., F.S.A., Mayor of Reading.
George Alfred Walker, Esq., St. James's Place.

Auditor—Joseph Peill, Esq.

Bankers—Messrs. Masterman & Co., Nicholas-lane, Lombard-st.
Physician—R. Hopkins Allnatt, Esq., M.D., F.S.A., Parliament-st.
Surgeon—Robert Grueber Shute, Esq., Mecklenburg-sq.
Standing Counsel—Harris Prendergast, Esq., Lincoln's Inn; Joseph Brown, Esq., Temple.
Solicitor—Edward Smith, Esq., 5, Chancery Lane.
Surveyor—John Barnett, Esq., Chancery Lane.
Consulting Actuary—W. Ratray, Esq., King William-st., City.

THE GREATEST PRESENT BENEFIT, AND THE GREATEST FUTURE ADVANTAGES to those who attain the average duration of Life are secured to the Assured in this Office, *a combination of advantages presented by no other in London.*

This Society is strictly a Mutual Assurance Society.

The principle adopted in the distribution of the profits is *peculiar to this Office*, and is at once safe, equitable, and favourable to good lives. The surplus is reserved for those Members who survive the period at which their premiums, with accumulated interest at 5 per cent., shall amount to the sums assured, and may be received in cash, or applied in the reduction of the future premiums, or to the increase of the sum assured.

An ample Guarantee is secured by a temporary subscribed Capital to be paid off as soon as it may be deemed expedient.

The Premiums are deduced from the Government experience, and are accurately adjusted to the several ages. At early and middle life they are about *one-fourth lower than at most other offices.*

All the objects of Life Assurance may be effectually accomplished at this Office, and generally the Directors are prepared to receive proposals of any description involving the contingency of human life.

More fully to extend the advantages of the Society, it is determined to establish LOCAL BOARDS throughout the Kingdom.

Every facility and information afforded on application at the Office, 17, New Bridge-street, Blackfriars,

CHARLES JAMES THICKE,
17, New Bridge-street. Resident Secretary.

LONDON, EDINBURGH, and DUBLIN LIFE ASSURANCE, 3, Charlotte-row, Mansion-house, and 18, Chancery-lane, London.

The more than usual success which has attended this Company has arisen—

From the combination of advantages formerly obtainable partly from proprietary and partly from mutual societies, thereby affording to the assured bonuses, reduction of future premiums, and complete freedom from responsibility.

From the indisputability of the policies, leave to travel beyond Europe, the option of payment of one-half the premiums for the first years, and immediate settlement of claims.

Prospectuses and rates forwarded by the Agents and Manager.

ALEX. ROBERTSON, Manager.

LIFE ASSURANCE AND ANNUITIES.

THE following are specimens of the low rates of Premium charged by the AUSTRALASIAN COLONIAL AND GENERAL LIFE ASSURANCE AND ANNUITY COMPANY.

Age.....	20	30	40	50	60
Ann. Prem.	£1 10 3	£2 0 7	£2 15 3	£4 1 8	£6 3 9

and of these Premiums one-third may remain unpaid in the hands of the Assured, at interest to be deducted from the sums assured, when they become claims.

Peculiar facilities are afforded for the assurance of the lives of persons proceeding to or residing in Australasia and the East Indies.

Immediate and Deferred Annuities are granted by the Company, on very favourable terms, and it is a peculiar feature in its constitution, that Annuitants participate in the profits.

DIRECTORS.

The Music to "The Passions" is Composed and Conducted by T. WALLIS, Mus. D c.—Open from 11 to half-past 5, and from 7 to half-past 10. Admission 1s.; Schools half price.

TO SPORTSMEN, TOURISTS, &c.

BERDOE'S SUPERIOR WATERPROOF FROCKS, SHOOTING-JACKETS, GARMENTS for the SEA-SIDE, &c.—An extensive variety of the above, in NEW and greatly improved materials always ready, guaranteed to exclude any rain whatever, and confidently recommended to those who regard a respectable appearance, or wish to avoid the disappointment and vexation consequent upon purchasing articles made by slopsellers, and sold by parties not Tailors.

FIRST-RATE CLOTHING of every description, upon the lowest terms possible, consistent with TRUE economy, and ultimate satisfaction.—W. BERDOE, Tailor, Waterproofer, &c., 69, Cornhill (north side).

INTERESTING TO LADIES.—To MESSRS. ROWLAND & SON, 20, Hatton Garden, London.—"Percy Place, Landport, Portsmouth, April 4, 1844. GENTLEMEN,—I think it but an act of justice to inform you of the benefit I have derived from the use of your admirable Macassar Oil. About six months ago I found my hair getting daily more weak and thin, and much discoloured from a practice I had adopted of wetting it continually; fearing that I should lose it entirely, and hearing of the efficacy of your Macassar Oil, I have for some time past constantly used it, and the result is, that my hair is now perfectly restored and much improved in appearance and colour, having become thick, dark and glossy; it also curls freely without the use of paper, which it never did before. To all my friends I have warmly recommended your Macassar Oil as an excellent restorative and preservative for the Hair. As I have an objection to see my name in print, I beg you will not publish it; but you are at liberty to show this letter, or make any other use you please of it, and refer applicants to me if necessary, in proof of the efficacy of your Macassar Oil. Your Obt. Servant *"

ROWLAND'S MACASSAR OIL preserves and reproduces the Hair; prevents it from falling off or turning Gray; changes Gray Hair to its original colour; frees it from Scurf and Dandriff, and makes it beautifully soft and curly.

**** Ask for "ROWLAND'S MACASSAR OIL." All others are Fraudulent Counterfeits.

SIX POUNDS OF TEA, whether Black or Green, for 17*s*; and small bright Gunpowder, in 12-lb. boxes, at 4*s.* 6*d.* per lb. East India Tea Company's Offices, 9, Great St. Helen's Churchyard, Bishopsgate-street.

News of the Week.

THE important announcement of the termination of hostilities between France and Morocco and the evacuation of the island of Mogadore is another guarantee for the peace of Europe. The Emperor, it appears, alarmed by the re-appearance of the squadron before Tangiers, despatched the Governor of that city to sue for peace. The conditions already proposed by France before the commencement of hostilities were again offered and accepted, and the treaty signed. The French flag was saluted by the cannon of the Moorish garrison, and the French Government, on receiving tidings of the event, welcomed it by a salute from the cannon of the Invalides at Paris. The Opposition papers, however, are by no means satisfied with the result; they contend that the moderation of the Government in limiting their demands to the terms of their former *ultimatum*, and their neglect of the usual conditions for the re-payment of expenses, are disgraceful to France, and additional proofs of her subserviency to Great Britain. Nothing certain is known of the movements of Abd-el-Kader, but his expulsion from the territory of Morocco is one of the chief points stipulated by the treaty. The departure of the King on a visit to this country is fixed for the 7th of next month, and preparations are actively in progress for the equipment of a steam squadron under Admiral La Susse to form the Royal escort. The state of Ireland is almost as much discussed by the Paris papers as the affairs of Morocco or Tahiti. The proceedings of Mr. O'Connell are of course commended by the Opposition journals, and the Ministerial organs consider that the time has come when the Government must either make great concessions, or obtain more extended powers than the law at present allows, for the purpose of suppressing the Repeal movement. —In Germany the result of the Appeal to the House of Lords is a leading topic of discussion, and the news of Mr. O'Connell's release has been welcomed in many of the provincial cities with public rejoicings.—From Greece we learn that dissension and intrigues have begun to show themselves in the new Cabinet of M. Coletti. Party feeling has assumed so serious a character that public business is almost suspended; and it is even expected that the protecting Powers will be obliged to interfere to save the country from anarchy.—From the Levant we have accounts of the negotiations between the Porte and the Ambassadors of the Five Powers on the affairs of the Lebanon, by which the arrangement of 1842 is confirmed, in accordance with the views of England, Russia, and Prussia. The Pacha of Egypt has entirely recovered from his late indisposition, and is about to undertake a hostile expedition against Abyssinia.—From the United States we learn that Mr. Tyler has withdrawn his name as a candidate for the Presidency, and that Mr. Clay will probably be returned by a large majority. In Canada, Sir C. Metcalfe has at length succeeded in forming a Ministry, comprising, it is said, most of the moderate men in the colony, whose influence and talents entitle them to confidence.

At home, the proceedings of the Repeal Association are the chief topic of the day. The rumour that the Whigs have made overtures of support to Mr. O'Connell, provided he will be content with a federal Parliament, is confirmed by the Repeal papers, and Mr O'Connell has declared his readiness to accept federalism as an experiment. The form of Government which is to supplant that under which the Irish now live is also under discussion; and the Association has offered prizes for written Essays on the question how far the constitution of Norway and its connection with Sweden may serve as a model for the new constitution of Ireland.

Home News.

HER MAJESTY'S VISIT TO SCOTLAND.—Her Majesty arrived at Blair Atholl Castle soon after 3 on Wednesday, escorted by Lord Glenlyon and a body-guard of Highlanders. On arriving at the mansion Her Majesty was received by Lady Glenlyon, accompanied by the young Master of Glenlyon and Mrs. Home Drummond, her Ladyship's mother. Four companies of 40 each, consisting of his Lordship's clansmen, attired in the Highland dress, were drawn up by the side of the portico, the pipers, in full Highland costume, greeting Her Majesty with the pibroch. The clansmen were commanded by Lord Glenlyon, assisted by the Major of the corps, the Hon. James Murray. The first company was commanded by Capt. Drummond, with his Lieutenant, the Hon. W. Drummond; the second, by Capt. Charles Drummond, with his Lieutenant, Sir David Dundas; the third, by Oswald of Dunnikier, with his Lieutenant, Kier of Kindroggan; the fourth, by Stewart of Urrat, with his Lieutenant, Butter of Fascaly, the owner of the magnificent mansion which is situated in one of the most picturesque spots in Scotland, just before entering the pass of Killiecrankie. Her Majesty appeared much pleased with the manifestations of loyalty with which she was greeted, and, after addressing a few remarks to Lady Glenlyon, entered the mansion, accompanied by Prince Albert. Within a few minutes, however, after the arrival of the Royal party, the Prince appeared in front of the mansion, accompanied by his noble host, Lord Aberdeen, Lord Liverpool, and Lord Charles Wellesley. His Royal Highness inspected the Highlanders, keeping his hat off as he walked through the ranks, a mark of courtesy which evidently afforded them no small gratification. The clansmen then marched round before the Prince, headed by the pipers playing the pibroch, whilst Her Majesty appeared at the window, and seemed much delighted at their picturesque appearance. Her Majesty did not leave the Castle after her arrival, but retired at once to her apartments, and dined in private with the Prince, as it was considered advisable that Her Majesty should enjoy some repose after the very great fatigue which she has recently undergone. Prince Albert, however, walked about the grounds and explored some of the precincts of the Castle. As evening closed in, large bonfires were lighted on the surrounding hills; and the rocky sides and steep acclivities of Ben-y-vrackie glared with flame. On Thursday Prince Albert accompanied Her Majesty in a walk through the grounds as early as seven o'clock. In the course of the day Her Majesty drove with Lady Glenlyon, in a small pony phaeton, to the marble quarries in Glen Tilt. Her Majesty alighted in the glen, and requested Lady Glenlyon to accompany

her into a Scottish cottage on the hill side, where Her Majesty remained for upwards of a quarter of an hour, and examined with apparent interest the few implements of husbandry and cooking which were strewed about the mud floor of the cottage. The simple inmates of the hut proffered their hospitality, by putting a bottle of mountain dew upon the table; but they had no conception of the rank of their illustrious guest. The old woman in the cottage was at her spinning wheel, with the "rock and wee pickle tow," and explained the use of it to Her Majesty, who sat down and conversed with her for some time. The Prince rode in the afternoon to the pass of Killiecrankie, and viewed the spot where Claverhouse fell. His Royal Highness was accompanied in his ride by Sir E. Bowater. The Prince afterwards rode for a few miles on the road towards Inverness, about as far as the Falls of Bruar. His Royal Highness did not go up to the Falls, but deferred his visit to a future occasion, when he will accompany Her Majesty to inspect them. Lord and Lady Glenlyon had the honour of joining the Royal dinner party in the evening. On Friday Her Majesty rose at an early hour, and walked about the grounds, accompanied by Prince Albert, who was attired in a shooting-jacket and drab hat. A garden chair, drawn by two servants in undress liveries, followed Her Majesty, and the Princess Royal accompanied Her Royal parents on a Shetland pony, led by a groom, and attended by a servant in scarlet livery. After breakfast Prince Albert went out grouse-shooting on the hills, where his Royal Highness had some excellent sport; several black cock were sent to the Castle by the Prince, in order that they might be prepared for Her Majesty's luncheon, and at half past 3 His Royal Highness rode back to the Castle, and drove Her Majesty out in the pony-phaeton, preceded by outriders. Lord Glenlyon and Sir Edward Bowater rode on either side of the carriage, the Highland chieftain wearing the two eagle's feathers in his bonnet. In the course of the drive, Her Majesty went along the high road to Inverness as far as the Falls of Bruar, but unfortunately a shower of rain prevented Her Majesty from alighting to view the most picturesque portion of the waterfall. The beauties of the Falls of Bruar have been considerably enhanced by a rich clothing of fir and oaks, fringing its rocky banks, which were formerly as bleak, bare, and desolate as the summits of the surrounding hills. These plantations were formed by the late Duke of Atholl, in compliance with the celebrated poetical epistle of Burns, who begged that some clothing might be placed upon the naked rocks; the birks are now dressed in woodbines, and the craggy cliffs adorned with the firs and thorns for which the poet petitioned in such glowing language. On Saturday Prince Albert went out deer-stalking with Lord Glenlyon. His Lordship had previously sent out large numbers of his foresters and clansmen to drive the deer into the passes of Glen Tilt, and the wind being favourable, the Prince had an opportunity of enjoying the sport under the most favourable circumstances. His Royal Highness succeeded in killing three red deer, weighing respectively 15, 12, and 11 stone, which were immediately forwarded to the Castle. Her Majesty drove towards Bruar in the afternoon in a carriage and four, accompanied by the Princess Royal, Lady Caroline Cocks, and Viscountess Canning. Sir E. Bowater rode by the side of the carriage on horseback. Her Majesty made a second effort to see the Falls of Bruar, but unfortunately on arriving at the bottom of the Fall, a severe storm compelled Her Majesty to make a precipitate retreat to the Castle. On Sunday, notwithstanding the heavy rain, Her Majesty attended Divine Service in the parish church. On alighting, Her Majesty was conducted by her noble host to his Lordship's pew, and shortly after the arrival of Her Majesty another of the Royal carriages drove up to the church containing Lord Aberdeen, Lord Liverpool, Lord C. Wellesley, Mr. G. E. Anson, and Sir. J. Clark, all of whom occupied places in the back of the Royal pew. Upon these feudal principles also, which, even upon the present occasion, were not departed from, places were assigned in the back of the pew for Lord Glenlyon's steward, and some other members of his Lordship's household. The Highland chieftain, with Lady Glenlyon, sat in the front seat with Her Majesty. Divine Service then commenced according to the Presbyterian form of worship. A Psalm was first sung in excellent time and tune. The clergyman, Mr. Irvine, then delivered an extempore prayer, after which another Psalm was sung, and the sermon followed, Mr. Irvine taking his text from the 13th verse of the 5th chapter of St. Matthew:—"Ye are the salt of the earth." Mr. Irvine's sermon was a plain straightforward discourse, delivered in a broad Scotch accent, but his enunciation was so clear and distinct that every word was perfectly intelligible to the English portion of the congregation. Mr. Irvine had the good taste to abstain from those personal allusions which, on former occasions of a similar nature, have been so distasteful to Her Majesty. In the short prayer which followed the sermon, and which concluded the service, the Queen and the Royal family were mentioned as a matter of course, but beyond this there was no allusion to the presence of the Sovereign. After the service, according to a custom still existing in some parts of Scotland, wooden boxes attached to the end of long poles, and called "ladles" by the Scotch, were handed into all the pews, in order that every member of the congregation might contribute his mite towards the support of the parochial poor. Her Majesty appeared to look with great interest at this method of collecting alms, and Prince Albert was evidently anxious to contribute, but a plate being placed at the kirk door, at the entrance to the chieftain's pew, enabled Her Majesty, the Prince, and the members of the suite, to leave their donations on going out of church. At the conclusion of the service Her Majesty was conducted to her carriage by Lord Glenlyon, an umbrella being held over Her Majesty to protect her from the rain, which continued to pour in torrents. At four o'clock the rain suddenly ceased; Her Majesty availed herself of the propitious change in the weather, and left the Castle in her garden-chair, accompanied by Prince Albert, and proceeded through the grounds to view the Falls of the Tilt and the Pender, which had derived additional grandeur from the recent heavy rain. Her Majesty returned to the Castle shortly before seven. On Monday the Prince left the Castle shortly after luncheon, and proceeded to the hills to have some grouse-shooting. His Royal Highness was accompanied by Lord Glenlyon, who merely went with the Prince to point out the most probable places for finding the game. The Prince had some excellent sport, considering the short period which he remained on the hill. His Royal Highness shot eight brace of grouse, a snipe, and a golden plover, and returned to the Castle shortly after three, to accompany Her Majesty in her drive. Her Majesty and the Prince then left the Castle in a pony phaeton with outriders to inspect the Falls of Bruar, which are about three miles distant from Blair Atholl, on the high road to Inverness. Lord Glenlyon and Lord C. Wellesley, the chieftain being as usual attired in the Highland costume, rode on either side of the phaeton. Her Majesty was struck with the beauty of the scene, and declared that each succeeding object which met her view surpassed its predecessor in beauty and interest. The Falls were seen to great advantage, and the roaring of the waters through the chasm was considerably increased by the heavy rains which had fallen during the preceding day; in ascending some of the steeper acclivities which lead to the topmost portion of the Falls, Her Majesty entered her garden-chair, which was drawn by two servants in plain liveries, and had been previously sent on for the use of Her Majesty. The royal party did not return to the Castle until a late hour in the evening. On Tuesday morning Her Majesty took her accustomed walk in the grounds, accompanied by Prince Albert and the Princess Royal. The Prince afterwards went out grouse-shooting, and the weather had so much improved that several excursions were talked of. Her Majesty is quite delighted with her residence; and the relief which its retirement affords from the bustle and the cares of court, together with the salubrity of the mountain air, and the freshness of the scenery, has already produced a marked and gratifying effect upon her health. Her Majesty continues her habits of early rising. At seven o'clock Peter Mackay, her piper, sounds the pibroch under the windows of the Castle, when Her Majesty rises, and all are expected to follow her example. Her Majesty has also given instructions that a bouquet of fresh-pulled heather shall be in her bedroom every morning, together with a bottle of pure water from a spring in Glen Tilt, famed for its purity. There is no company at the Castle beyond the suite; the gates are rigidly closed against the public; and such are the precautions taken against the intrusion of the curious, that a cordon of guards is placed night and day all round the policies. Even when the Queen and Prince appear beyond the gates of the Castle (which they generally do at least once a day), their privacy is scarcely less complete, for there are comparatively few strangers at Blair Atholl, and the inhabitants are busy with the operations of the harvest. As a proof, however, of the ubiquity of the press and its representatives, we may mention that there are at present at Blair Atholl reporters from the London *Times*, *Morning Post*, *Morning Herald*, *Morning Chronicle*, and *Illustrated News*. From Edinburgh there are the reporters of the *Courant*, *Scotsman*, *Witness*, and *Mercury*; from Glasgow the reporter of the *Argus*, with others from Dundee, Perth, Aberdeen, &c.

THE ROYAL FAMILY.—Since the arrival of the Royal children in Brighton, the Prince of Wales and the Princess Alice have been taken out in a carriage each morning and afternoon, with the exception of Sunday, when the weather was not favourable, for an airing. The Pier Company have placed the Chain-pier at the special service of Lady Lyttelton and the Royal children from 9 till 10 o'clock, and during that hour no person is admitted. Their Royal Highnesses are in excellent health.

Illness of Miss Peel.—Accounts received this week from Drayton Manor state that all danger has ceased, and that Miss Peel is gradually recovering from her recent severe attack.

Count Nesselrode.—His Excellency Count Nesselrode visited the nursery of Messrs. Hugh Low, and Co., at Upper Clapton, on Wednesday last, and notwithstanding the unfavourable state of the weather, spent upwards of an hour and a half in examining minutely many of the curious and most interesting plants in their collection, with the names of which, and the countries from which they originally came, he seemed intimately acquainted. His Excellency left town on Thursday, accompanied by his son and the Baroness Seebach, his daughter, for Woburn Abbey, on a visit to the Duke of Bedford. The Count, after visiting Stowe and Chatsworth, will make a short tour in Scotland, returning by the lakes, and finally leave England on the 4th of next month.

Official Appointments.—The Queen has been pleased to appoint Thomas Norton, Esq., First Puisne Judge of British Guiana, to be Chief Justice of Newfoundland; Sir Alexander Malet, Bart., now Secretary of Embassy at Vienna, to be Envoy Extraordinary and Minister Plenipotentiary to the King of Wurtemberg; Justin Sheil, Esq., now Secretary of Legation and Chargé d'Affaires in Persia, to be Envoy Extraordinary and Minister Plenipotentiary to the Shah of Persia; and Arthur Charles Magenis, Esq., now Secretary of Legation in Switzerland, to be Secretary of Embassy at Vienna.

Foreign.

FRANCE.—The following telegraphic despatch, dated Bayonne, Sept. 15., announcing the termination of hostilities between France and Morocco, reached Paris on Sunday, having been transmitted by the Prince de Joinville to the Minister of Marine, and by the Duc de Glucksberg and M. Nyon to the Minister for Foreign Affairs:—"Tangiers, Sept. 6. The Moroccan Government has asked for peace. The squadron arrived before Tangier this day. The Governor of the city came on board, and renewed his request. Our conditions were signified to him, and accepted, and the treaty signed. In the course of the day the (French) Consul-General was re-installed, and his flag saluted by the cannon of the city. Orders to discontinue all hostilities, and to evacuate the Isle of Mogador, will be forwarded this evening." This important despatch monopolised the attention of the Paris press and the Paris public on Monday. The event was deemed of so much importance by Government, that a salute was fired by the cannon of the Hotel des Invalides in celebration of it on Monday morning. On the Bourse the effect produced by the intelligence was not so favourable as might have been expected, or rather it was counteracted by rumours that Ministers would not positively realise the 300,000,000 of the loan still in their hands early next month. In their observations on the telegraphic despatch, the Paris papers unanimously rejoice in the assurance of peace it conveys, and are by no means sparing of compliments to the navy, the army, and to France in general, upon the lesson taught to Europe, and indeed to the world, by the chastisement inflicted on the Moors, and from which they anticipate important effects upon surrounding nations. Some apprehension was felt, in the absence of details, that Abd-el-Kader was still as formidable as ever, but we shall not long remain in ignorance on the subject, as the despatches were daily expected to arrive in Paris. In the meantime, it is gratifying to learn that the arrangement of the affair is said to have been brought about by our Government through Mr. Bulwer, our Minister to the Court of Spain. It appears that this pacific result was not anticipated, as three days before the receipt of the despatch, the Duc de Glucksberg and M. Nyon had been empowered to reopen the negotiations on the part of France. The Opposition papers are loud in their censure of the Government for having renewed the negotiations with the Emperor of Morocco at all, and blame, especially, the moderation which limits the demands of France to the terms of the former *ultimatum*. The *Constitutionnel* declares that such a policy destroys the whole of the good effect produced by the battle of Isly and the bombardment of Mogador. It sees in this step a new instance of the subserviency of France to England, "for every one can understand that France did not take this absurd step of sending an embassy to Abderrahman of her own accord."—The expenses which the war has already required have been ascertained at the Ministries of War and Marine to amount already to upwards of 20,000,000 francs, and the Cabinet is violently assailed for tendering peace on no harsher terms than those it proposed before the battles of Isly, Tangiers, and Mogador. This forbearance is, of course, imputed to a dread of the displeasure of this country, which, after being alternately represented as favouring and favouring the negotiations of France, and opposing and thwarting her operations, is now considered as anxious that she should forthwith make peace, but on the most unprofitable terms. The *Presse*, however, differs from the majority of its contemporaries, and suspects that England would gladly see France engage in an interminable war in Africa, even should she decide to Tetuan, Larache, and Salee, and burn Fez, Mequinez, and Mazagan. The King has written an autograph letter to Marshal Bugeaud, thanking the Army in very cordial terms for their services at Isly.—The incarceration of Mr. O'Connell has excited a great degree of interest throughout France, and his conduct since the abrupt conclusion of his imprisonment is narrowly watched, and universally approved of for its ability and prudence. The *Globe* draws the following distinction between the agitation of which Mr. O'Connell is the leader, and the agitation produced in France during the revolution:—"All the world will certainly have observed that the principal feature of the prodigious influence exercised at this moment by O'Connell is its religious character. Since what chroniclers have related of Peter the Hermit, of St. Bernard, and of Luther nothing has certainly been seen like it in the world, and antiquity offers no example of anything approaching to it. There lies the thing that removes all danger from that association of innumerable multitudes who blindly follow on the footsteps of O'Connell; for the first result of religious exaltation is to render men honest and tractable. There, again, is the thing which completely distinguishes O'Connell from all those popular clamourers whom the revolutionary spirit has engendered in France, and whose frightful sectaries only unite to howl hymns of blood, pillage, destruction, and assassination." The *Siècle* states, that the "Whig journals congratulate themselves on the decision of the House of Lords, in the hope that this event will render O'Connell so powerful that it will be impossible any longer to refuse that justice which he demands in the name of his countrymen. During their long possession of office the Whigs caressed and lulled Ireland to repose, but they never made any concession

of principle calculated to calm the agitation of Repeal. The return to power, therefore, of Lords J. Russell, Palmerston, and Normanby, would not settle the difficulty; such an event would, on the contrary, increase the difficulty, the Whigs not being in a position to carry such extensive reforms as the Tories. The latter granted Catholic Emancipation, which their adversaries certainly could not have carried through Parliament. To speak candidly, we know not whether it be possible to reconcile the two nations; but if reconciliation be possible, it is only on the following conditions:—The appropriation of the Protestant Church lands to general purposes after the demise of the present incumbents; the establishment of the fixity of tenure, so as to render the farmer independent of his proprietor; a revision of the law of election, with a view to the extension of democratic principles, and a proportional increase of the Irish Members of Parliament. Will Sir Robert Peel subscribe to such conditions? And if he be willing, has he the power? This appears doubtful according to the tone of the Tory journals. O'Connell himself is, perhaps, not yet decided what course he will pursue, but assuredly he will not commit the fault of braving the law; and we may on the contrary depend on his skill to leave England no resource but to attempt a *coup d'état* (a measure beyond the law), which, in our days, destroys those who make use of them to save themselves. England, whose sophisms are now well understood, is before Ireland in the same position as she is before all people who reason—she has nothing to gain by discussion. O'Connell will continue to discuss without changing anything but the place and form of the popular meetings. If the plains and mountains of Ireland are closed against him, he has open to him all the Catholic churches, and on the same day, and at the same hour, 20,000 priests will preach to millions of Irishmen on their knees before the image of Him who died for the liberty of the world."—The *Revue de Paris* states that the King's departure for England has been definitively fixed for the 7th of next month. His Majesty is to be accompanied by his two younger sons, and the Ministers for Foreign Affairs and Marine. The Gomer, in which His Majesty is to proceed to England, is the largest war steamer of the French Navy. She is of 450 horse-power, and carries 20 guns. The Gomer is one of the vessels constructed at Rochefort for the Transatlantic service, and has performed a voyage of nearly two years in the principal seas of the globe, during which she has been sufficiently proved. Her capabilities have been skilfully made available for the accommodation of passengers. The King will have for his use and that of the persons of his suite a complete apartment. The names of the vessels which are to form part of the royal escort, under the command of Vice-Admiral La Susse, are not yet known, but it is believed that the flotilla will only consist of steamers. His Majesty's stay in England will be very short, as he will not be absent from his own kingdom for more than seven days, and it is not his intention to visit London. It is understood, likewise, that it is His Majesty's wish that the visit should be a strictly private one, and it is probable that few or none will be invited to Windsor Castle during his stay but the members of the court. The King will hold no court during his stay in England.—It is believed that the long-talked of marriage between the Duc D'Aumale and the Princess of Salerno, niece of the King of Naples, will take place soon after His Majesty's return from this country.—The Council-General of the Department of Bridges and Roads has decided that the Tours and Nantes railroad shall pass through Angers.—The *Constitutionnel* announces that a royal ordinance, appointing 32 new peers, would be published in a few days. It also states that the coat-of-arms of M. Guizot, painted on the panels of his elegant equipage, has recently undergone a modification. The broad tri-coloured riband, to which was suspended the cross of Grand Officer of the Legion of Honour, has been replaced by the magnificent collar of the Golden Fleece, of which M. Guizot is a member. The famous motto, *recta brevissima omnium*, has been preserved.

SPAIN.—Accounts from Madrid of the 12th inst. state that the convention concluded between Spain and Morocco had been sent to Tangier, to be ratified by the Emperor. The elections still continued in Madrid and in the provinces to be favourable to the Ministry. The report of a ministerial modification was beginning to assume some appearance of probability, and M. Martinez de la Rosas was expected to accept the office of Foreign Minister.—According to advices from Bayonne of the 8th inst., the Carlists were actively intriguing in the northern provinces of Spain. The Progresistas, on the other hand, were not idle. Considerable sensation had been created along the frontier by the sudden disappearance of Gen. Zurbano from his estate in the neighbourhood of Logrono. The Duke de Rianzares (the celebrated Munoz) had passed through Bayonne, on his way to Paris.—The Barcelona journals of the 9th inst. state that the engineers who are to survey the line of railroad to be constructed between that city and Mataro, under the direction of Mr. Joseph Locke, were expected towards the close of the month. The drawing of the conscription had been the occasion of some rioting at Barcelona. The young men liable to it had insulted the alcaldes who presided at the operation, and the Captain-General himself. The garrison had remained an entire night under arms, and several of the rioters had been arrested.—Letters for Algesiras of the 1st inst. announce that the Spanish emigrants residing at Gibraltar were all embarked, by an order of the Governor of the place, in the steamer, for London, on the 31st ult. The only refugees remaining were General Nogueras and Messrs. Valdez and Conti, who were shortly to leave for France. The *Chronica* of Gibraltar of the 2d announces that in the afternoon of the preceding day the son of the Emperor of Morocco repaired on board the Formidable, British 74 gun ship, where he was received with all the honours due to his rank.

GERMANY.—The *Konigsberg Gazette* gives at great length the account of the ceremonies on the celebration of the 300th anniversary of the foundation of the University of that city, which commenced on the 1st inst. His Majesty, who had been for 36 years Proctor of the University, was pleased to issue a proclamation, approving the plan for a new building, of which His Majesty laid the first stone at this ceremony. His Majesty addressed the numerous assembly present in a very impressive speech, in which he expressed his confident expectation that his wishes would be fulfilled with the Divine blessing, with the aid of the faithful care of the teachers, and the noble sentiments of the youth committed to their care. He invited them, while he was striking the foundation-stone with the hammer, "to salute with their heartfelt and joyous huzzas this focus of light for our north." The most profound silence prevailed during His Majesty's address, which was perfectly well heard by the greater part of the great multitude of spectators, whose acclamations at the close were unbounded.—The Frankfort papers give accounts from Coblentz of the 8th inst., which state that the news of the acquittal of Mr. O'Connell has produced an extraordinary sensation in that city. Immediately after its arrival, his portrait was exhibited, surrounded with garlands, and even an illumination was talked of. An Englishman, who had become notorious for his anti-Irish opinions, considered it prudent to quit the city in consequence of these demonstrations.—A letter from Hamburg of the 3d states that the French Government has formally protested against the payment of the Stade duties. The Carlsruhe papers of the 6th contain the treaty concluded on June 27th between France and the Grand Duchy of Baden, for the reciprocal extradition of criminals for murder, incendiarism, forgery, coining, fraudulent bankruptcy, and perjury. Political offences form an express exception.—The *Nuremberg Correspondent* gives the following from Presburg, Sept. 5:—"The late scenes in the Chamber of the Magnates of Hungary are responded to in the country. The rupture between the two Chambers has never been so marked—they almost came to blows in the place of sitting. A Palatine, who has now presided over the assembly for 49 years, has declared that he never witnessed so violent a Parliamentary storm. The Second Chamber does not allow itself to be intimidated by the resistance of the majority of the magnates, but insists on the proposed reforms. It has just decided that the rights of landed property should be extended to the classes which are not noble, but this resolution will certainly not be approved of by the magnates. In several districts meetings have been held to petition the Government not to close the session at once. In a meeting at Pesth very violent language was used, and it was agreed to send in a protest against the conduct of the Upper Chamber. This example, it is thought, will find imitators."—Prince Augustus of Saxe Coburg and his consort, Princess Clementine of Orleans, have been visiting the estates of the Duke Ferdinand of Saxe Coburg in Hungary.—A letter from Breslau of the 1st, states that the weavers, who had lately caused the disturbances at Peterswaldau, have been condemned to the number of 80 by the criminal court. They were divided into two categories, the one of rebels, the other of rioters. The highest punishment awarded was nine and eight years of imprisonment with hard labour, to which two of the ringleaders were sentenced. Tranquillity is now perfectly restored, and the usual activity prevails.—Letters from Trieste of the 6th state that the Emperor and Empress of Austria arrived in that town on the evening of the 5th, and will remain there for ten days, during which time *fêtes*, reviews, and regattas on a splendid scale will do honour to the occasion. The Archdukes John and Frederick, the Grand Duke of Tuscany, and the Duke of Modena, have arrived at Trieste on a visit to the Emperor, as also Prince Metternich, Prince Kolowrath, the English Ambassador, &c.

ITALY.—A letter from Rome of the 3d inst. states that the Pope has appointed Monseignior Magni Provincial Auditor of the rota for Spain. It is thought that the differences between His Holiness and Spain are on the point of being arranged. The suspension of the sale of the church property by the Spanish Government had had a favourable effect in that quarter.—Vincent Cammuccini, the most celebrated of the Italian painters of the present day, died a few weeks ago at Rome, in the 70th year of his age.—A melancholy event occurred at Rome on the 28th ult.: two ecclesiastics, students of the Irish Franciscan college in that city, were unhappily drowned whilst bathing in the Tiber. One of the deceased, the Rev. E. F. Martin, was in priest's orders, and his companion, the Rev. R. A. Kavanagh, was ordained subdeacon on the previous Sunday.—The Turin papers mention an event which has cast a gloom over the whole Protestant population of the valleys of Piedmont. The long-tried and most influential political friend of the Vaudois, Count Waldburg Truchsses, Minister Plenipotentiary of the King of Prussia at the Court of Turin, has at length sunk under a painful disorder, which has long afflicted him. His loss will be severely felt in the Vaudois, for whom he had so often exerted his influence with the Sardinian Government, that he was generally looked upon as their political protector.—The Duc de Bordeaux is at Venice, where a legitimist congress is shortly to be held,

GREECE.—We regret to find that this country is again the scene of civil and political dissensions. A letter from Athens of the 31st ult., in the *Sud* of Marseilles, states that dissensions had already commenced in the new Ministry, particularly between M. Metaxa and M. Coletti, the former having manifested a determination to appoint only his own partisans to Government offices. In consequence of this misunderstanding, the elections for the capital had been postponed. Another letter of the 26th ult. states that the Coletti Ministry would find it impossible to weather the impending storm, and that the protecting Powers would again be obliged to interfere, in order to save the country from anarchy. The new Minister of War, Tzavellas, had sent a despatch to General Grivas, who is at Alexandria, inviting him to return and take his seat in the Chamber of Deputies, promising him at the same time a brilliant reception. Sir E. Lyons had sent to Malta for a ship of war. The steam-frigate Devastation had already arrived at Athens from Constantinople, and there were five vessels of war of different sizes at the Piræus. It will be remembered that General Kalergi took the Greek troops under his command on the morning of the 3d (15th) September, at Athens; that while performing his duty to his country, he put himself under the orders of the Council of State, assembled an hour after the palace was blockaded by troops and citizens; that neither then or afterwards, while General Kalergi commanded the garrison of Athens, and guard of the National Assembly, was his conduct in the smallest degree impugned; and that at the close of the National Assembly he received its thanks, together with a sword from the citizens of Athens, when, also, the rank of general and aid-de-camp was personally conferred on him by King Otho. His command is now so interfered with, that he finds himself bound in honour to resign, and his resignation is accepted without one word in reply.

RUSSIA.—The *Cologne Gazette* states, from St. Petersburg, that the Emperor of Russia, upon the proposition of the Minister of Public Instruction, has given orders to send a certain number of students to Germany, Sicily, Italy, France, and England, to complete their education, so as to be properly qualified to act as professors of colleges in Russia. The *Bremen Gazette* of the 3d inst. says:—"The Count de Nesselrode is expected soon at St. Petersburg. We are assured that he has communicated to the English Cabinet the views of his Government relative to the war in the Caucasus, and has obtained a promise from the English Cabinet that in future English agents shall neither send ammunition nor provisions to the mountaineers by way of Constantinople."

TURKEY.—We have accounts from Constantinople to the 29th August. Conferences have taken place between the Reis Effendi and the Ambassadors of the Great Powers respecting the indemnity to be given to the Maronites, and to the administration of the Lebanon, and also to determine if any modification should be made in the resolution adopted in accordance with the Ambassadors of the Five Powers on the 7th December, 1842. France demanded some modification, and especially the reinstatement of the Shehab family. Austria wished for a change, but did not insist on the reinstatement of the Shehab family. England, Russia, and Prussia wished matters to remain as they are. The Porte has supported the views of England and Russia. The concessions made to the English and French ambassadors by the Porte, relative to Mussulmans becoming Christians, has not been without its effect. A young Greek, who embraced the Mahometan faith, after some time thought proper lately to alter his opinions, and became once more a Christian. He was immediately thrown into prison, but the Turkish Government immediately ordered his release, and informed the Cadi that a renegade might return to Christianity without incurring any punishment.

EGYPT.—Letters from Alexandria of the 30th ult. state that Mehemet Ali had entirely recovered from his late indisposition, and resumed his usual serenity. The Pasha was preparing a new expedition against Abyssinia, and was anxious to avail himself of the rise of the Nile, which had reached 20 cubits, to send troops in that direction. Several detachments of regular and irregular soldiers had already proceeded thither from Cairo. Mehemet Ali had hitherto been deterred from undertaking that expedition by the fear of England, and, on his recent return to Alexandria, when he announced his intention to the European representatives, he said, "I have long contemplated to give a good lesson to the Abyssinians, to punish them for their frequent inroads on the territory of Ateche, but the Consuls of England always thwarted my project." Mehemet Ali having shown himself to all the European envoys, and convinced them that he was both sound of body and mind, left on the 30th for the garden of Moharem Bey, and after spending a few days in that residence, was to set out for the provinces and Cairo.

WEST INDIES AND SOUTH AMERICA.—By the Tay and Tweed steamers we have advices from Jamaica to the 28th August. The Tay, having met with an accident, being obliged to go into Fayal, met there Her Majesty's surveying steamer Styx, to which ship the mails were transferred, and both ships came home in company, and landed the mails at Plymouth on Friday. The Tay brought 12 passengers, and left 21 passengers at Fayal, who came home in the Tweed. The Jamaica papers reiterate the complaints of the colonists against the Government for their conduct with respect to the sugar duties, and state that the feeling throughout the island remains undiminished—that the measure was highly injudicious. The season generally is reported

favourable all along the coast, having been and remaining dry, and large crops are expected next year. The planters are said to be meditating some attempt to reduce the price of labour, but without immigration to a large extent, it is not thought that any general reduction of wages can be carried out. Guano is coming into general use as manure for coffee plantations in Jamaica, and the coffee-trees manured with it are said to be looking well. Bone manure, it is reported, will also be extensively used, and the prisoners in the Penitentiary at Kingston are employed in preparing it. The 1st of August, being the anniversary of negro emancipation, passed off in the usual satisfactory manner. The season in Demarara is reported to be as favourable as the planters could desire. At Guadaloupe, on August 26, a dreadful fire broke out, destroying 56 large mercantile stores, the custom-house, and other buildings, to the value of 300,000 francs.—Letters from Mexico, dated the 6th July last, state that a widely-extended conspiracy had been discovered by the government, the object of which is to change the federative republic into a constitutional government, with a European prince of royal blood at its head, with the title of "Emperor." It was, however, the opinion of well-informed persons that, on the eve of a war with Texas, the executive power will not proceed to rigorous measures against the conspirators, amongst whom, it is said, there is more than one general officer, but they will undoubtedly be strictly watched.—The *Argentine News* states that Commodore Purvis left Monte Video on the 26th June for Rio Janeiro, in his flag-ship Alfred, accompanied by the Ardent steamer, and that they were informed he had received positive orders "never to return to the River Plate." It is stated, in reference to this announcement, that Commodore Purvis was recalled by orders from his own Government, and as the consequence of dissatisfaction with his proceedings in the River Plate.

UNITED STATES AND CANADA.—By the Acadia steam-ship we have accounts from New York to the 31st ult. They do not communicate any intelligence of importance. The Presidential canvass, of course, principally occupied public attention. Large meetings, characterised by great order and quiet, were being held in every part of the country, and the prospects of Messrs. Clay and Freelinghuysen continued brilliant. President Tyler had issued a lengthy manifesto, withdrawing his name as a candidate, and vindicating the policy of his administration; and Mr. Polk, the opposing candidate, had written in favour of a tariff for protection merely, and not for revenue. The withdrawal of Mr. Tyler will tend to strengthen the democratic party. By the last accounts from Nauvoo the city was quiet. The Mormons give about 2000 votes, all of which are for Ford, the present Governor, who had ordered a brigade of the militia to hold themselves in readiness to march at the shortest notice in defence of the Holy City, should any outbreak occur in that vicinity, as is still apprehended by the Mormons. There had been reports of the appointment of Smith's son, a mere lad, as a prophet, but they are unfounded, as Sidney Rigdom, it is said, will be chosen to lead the Mormon flock. He is their master spirit, and will, it is said, make a shrewd and energetic leader. Of all the fanatics which have made their appearance during the past century in the United States, these are the most extraordinary. There are five widows of the Smith family now living in Nauvoo, or the Holy City; the mother of them all and the wives of the late Joe Hiram, and their two brothers. Accessions to the Mormons continue to be made. Their temple is steadily going up, in its unique form and shape. Its style of architecture is of the pure Mormon order.—From Canada we have advices of the 29th ultimo. It is confidently asserted that Sir Charles Metcalfe has at length succeeded in forming an Administration as follows:—President of the Council, Mr. Viger; Secretary, Mr. Daly; Attorney-General for Upper Canada, Mr. Draper; Attorney-General for Lower Canada, Mr. Sherwood; Solicitor-General for Upper Canada, Mr. Chabot; Commissioner of Crown Lands, Mr. D. P. Papineau; Receiver-General, Mr. W. Morris; Inspector-General, Mr. Merritt. It is also given out that the present Ministry do not deem it advisable that the existing Parliament should be again assembled. If this be true, and it is countenanced very confidently by the *Montreal Courier*, a dissolution and general election throughout the province may speedily be expected. The above appointments are said to be good ones, comprising most of the moderate men of the colony whose talents and influence entitle them to public confidence. Another rumour is, that the celebrated Papineau is on his way to Canada, to oppose the ex-Ministry.

NEW ZEALAND.—Accounts from New Zealand state that on the 12th February an interview took place between Governor Fitzroy and the New Zealand chiefs concerned in the massacre at Wairau. After a request to hear from them their own account of the affair, which was complied with by Rauparaha, his Excellency having deliberated for some time, addressed the natives to the effect that, as the English had in the first instance been in the wrong, and the New Zealanders had been betrayed into unlawful acts both by their ignorance of English law, and by the great provocation they had received, no punishment should follow their offences. He concluded by assuring them that he would punish all attempts on the part of the English to wrong the natives, and exhorted the chiefs in their turn to exercise their influence to prevent the natives from any similar infringement of their mutual rights.

CAPE OF GOOD HOPE.—We have advices from the Cape to July 10, and from Graham's Town to July 4. These papers contain an extract from the Government Regulations respecting emigration to the Cape, and the stipulations regarding bounty orders, by which it appears that at the rate of bounty proposed, the sum voted for this purpose being 10,000*l.*, may afford a supply of about 800 labourers annually to the colony. The minute seems to have given great satisfaction to the public at the Cape. The papers contain the reply of Lord Stanley to a petition transmitted from the Municipal Commissioners of that place, addressed to the Queen in Council, setting forth the grievances to which they are subjected by the present frontier system, and praying that the principles of the treaties entered into with the Kafirs by Sir Benjamin D'Urban may be re-established. In answer to this application, Lord Stanley refers to an extract from a despatch of the 11th March last, which he had transmitted to the Lieutenant-Governor, containing the reasons for which he had found it not consistent with his duty to advise the Queen to accede to the prayer of the petition. An enterprising gentleman of the name of Smith had performed the journey into Kafirland, and made a personal examination of the coast from the Buffalo to the Umzimvooloo. The result of his journey has been the establishment of a trading station in Hinza's territory, and the opening of a direct maritime communication with the Kafir country. The Kafirs had recommenced their depredations, and two farmers in endeavouring to rescue cattle from their hands had been severely wounded.—By a letter received at Lloyd's it appears that advices had been received by the writer from Ichaboe, of the 6th July last, from which it appears that serious disturbances had occurred amongst a portion of the vessels loading at the island with guano, and that several parties had been put in irons and forwarded to St. Helena. The officers selected by the committee appointed by Captain Brooks, of H.M.S. Thunderbolt, to form a judicial body, had elected Captain Hancock, of the Victoria, commodore, who had deemed it advisable, the island being in a state of mutiny, to send to the Cape for the assistance of a man-of-war. The brig Canning had been despatched for that purpose. The number of vessels loading at the date of the letter abovementioned is represented to have been between 70 and 80, and the origin of the disturbances was from the newcomers attempting to take precedence of previous arrivals in the loading of the vessels.

BORNEO.—By letters received at Lloyd's on Monday, from Singapore, we learn of further atrocities by the pirates off the coast of Borneo. In addition to the capture of the Belgian brig Charles, another unfortunate ship, called the Luckly Blass, a brig 200 tons burthen, has been taken by them, plundered, and afterwards set fire to, and the whole of the unhappy crew and passengers, amounting, it is reported, to 18 persons, massacred. The murderers there is no doubt are the same who murdered the Hon. Erskine Murray and two seamen in January last. A letter from an officer on board H.M.'s ship Samarang, off Solombo, Java Sea, and dated June 20, gives an account of a recent conflict with the pirates who infest the place. A party of 40 attempted to surprise the captain of the vessel (Sir E. Belcher), who was on the reef of an island near Tidore with his instruments, but were soon repulsed by the firing from the barge, which was in attendance. The captain, after this aggression, determined to chastise the pirates, and finding the island deserted, gave orders that the village and all the vessels on the beach should be burned. He chased two of the vessels called "prahus" (pronounced "prow") with the barge, and their crews having deserted them, they were towed out and burned. About midnight he anchored his barge in a retired bay, but was surprised at 2 o'clock in the morning by the sound of gongs and other instruments, and before the party was ready for action five large war prahus were close upon them, all gaily decorated. The leader demanded of the party in the barge if they had a ship, and on the captain answering that the British ship-of-war to which they belonged was outside, they set up a yell, and began dancing and throwing spears. The English repelled them by a discharge of shot and canister, and secured three of the prahus, which would not burn when an attempt was made to fire them. While the English were pursuing the other two prahus, five more made their appearance, and were repulsed, not, however, till the captain was wounded in the thigh by a ball of 1 lb. weight, and 1 9-16 inches diameter. In this condition he was taken to the ship, when the ball was extracted, and another engagement ensued between the barge, accompanied by two cutters, and some more prahus, some of which were taken and burned. The captain at the date of the letters was in a fair way of recovery, while the pirate chief is supposed to have been killed.

CITY.

Money Market, Friday.—Consols closed at 99⅝ and ¾ for Money, and 99⅞ for the Account; Bank Stock, 207; India Bonds, 92; Exchequer Bills, 74 to 76, pm.

GAZETTE OF THE WEEK.—BANKRUPTS.—G. ROSSITER, Bridgewater, jeweller.—F. C. HOPKINS, Tottenham Court-road, commission agent.—S. HADFIELD, Fawcett-street, Manchester, file manufacturer.—T. and J. JONES, Liverpool, tallow chandlers.—J. S. HOLMES, Liverpool, shipbroker.—W. TAUMBLE, Liverpool, licensed victualler.—W. H. DARKE, Aston juxta Birmingham, chemist.—J. CRICH, Sheffield, maltster.—F. SHUTTLE, Portsea, grocer.—W. COLLIER, Cambridge, grocer.—F. BATES, Shoreditch, linendraper.—B. NICOLL, Rutland's-row, Islington, tailor.—T. MARSH, Canterbury, miller.—W. SCOTT, jun., Ellsworth, Southampton, builder.—E. BURNETT, Richesmanufacturer.—J. and W. BAIL, Langley, Cheshire, silk manufacturers.—J. court, Lime-street, merchant.—J. GRUNDY, Ramsbottom, Lancashire, woollen HIGHAM, Liverpool, provision dealer.—A. PATTERSON, Liverpool, livery stable keeper.—I. ANDERSON, Warley, Yorkshire, worsted spinner.

BANKRUPTCY ANNULLED.—S. H. T. BISHOP, Upper Ground-street, Blackfriars, iron merchant.

Metropolis and its Vicinity.

The late Forgery at the Bank.—The discovery of the late forgery on the Bank of England for 8000*l.* has been a matter of general conversation since the event occurred. The following is understood to be the manner in which Burgess, the Bank clerk, and his accomplice effected the fraud. The former, by his intimate acquaintance with the Bank books, found that a stockholder of many years' standing, Mr. William Oxenford, of the Long Room, Custom-house, had a large amount of money in Consols, and having obtained leave of absence for a few days, it was during this interval that the forgery was executed. Having obtained this knowledge, it seems he obtained a party, his accomplice, to represent the *boná fide* holder of the stock, and they proceeded to the Bank, and there effected a transfer of 8200*l.*, Burgess identifying his friend as a holder, and hence lulling suspicion. Directly they obtained the stock, they sold it at the current market price, and changed the notes they received into gold, which in equal divisions of 4000*l.* was deposited in a carpet bag, and taken away in a cab by the accomplice. It was not till the absence of Burgess continued beyond his appointed time that a doubt entered the mind of his fellow-clerks of the legitimacy of the transaction, but when inquiries were made for him and he could not be found, the matter was investigated and the result ascertained. The culprits having had a week's start of the officers, there is every reason for supposing that they embraced the opportunity for a Transatlantic trip, and up to the present time no clue has been discovered of their retreat, although rumours from day to day have been circulated on the subject. So barefaced a fraud was never before committed, and the Barber and Fletcher conspiracy, notwithstanding its organisation was of a more complicated and ingenious character, was nothing to compare to the effrontery with which this forgery was carried out. The Directors of the Bank, it is understood, will in future not allow clerks to identify, but strictly enforce comparison of signature, and take the word of the broker, who will be made to suffer the loss in case of forgery or fraud following. It is said Burgess was originally introduced into the Bank by two of the Directors, who knowing his father to be an honest, industrious man, felt inclined to serve him and his family, and became sureties for the youth to the extent of 1000*l.* This amount, of course, they will have to pay. The remainder will be made up from what is termed "the Clerk's Fund," which is specially raised by general subscription yearly, according to the amount of salaries paid, for the liquidation of such losses.

The late Wills Forgeries.—At the Court of Aldermen on Tuesday, Sir P. Laurie brought up the Report of the Committee to which it was referred, to allow John and Daniel Forrester, the able City officers, a sum of money as an acknowledgment of their extraordinary exertions in the late detection and apprehension of the will forgers. The Report recommended that the court should vote the sum of 100*l.* to each of these officers. Alderman Farebrother said he perfectly agreed with the committee in the high opinion they had expressed of the merits and exertions of these clever officers, but he preferred to the proposed plan, that of voting to them the money in terms of a general nature referring to the services which they were constantly rendering to the public. To reward them for their exertions relative to the individual cases of the will forgers would be to reflect upon the Government, as if the two persons who had been principally instrumental in bringing such criminals to justice had not been properly considered in the payment of the expenses of the prosecution. In order to make the vote unanimous, he hoped a change to the effect he suggested would be adopted. Sir P. Laurie agreed in the propriety of the suggestion, and the term of the recommendation having been altered, 100*l.* was unanimously voted to each of the officers.

Marble Statue of Her Majesty.—A marble statue of the Queen, by Wolff, was landed a few days since at the St. Katharine's-dock, from Leghorn. In consequence of the absence of Her Majesty on her marine excursion, the statue has been removed to Windsor, and an officer of Customs has been appointed to superintend the examination at the Castle.

The Royal Exchange.—Her Majesty has signified her intention to open the Royal Exchange in the course of the last fortnight of October. Prince Albert is to accompany Her Majesty upon the occasion. In consequence of this announcement the following motion will be brought forward in the next Court of Common Council:—"That Her Majesty having been graciously pleased to signify her intention of opening the new Royal Exchange, in company with His Royal Highness Prince Albert, this corporation, as a means of evincing their attachment and loyalty to the Royal person, do invite Her Majesty and His Royal Highness to a banquet in the Guildhall on the occasion."

Court of Aldermen.—At the Court, on Tuesday, Alderman Brown took leave of the Court on being appointed City Chamberlain, and subsequently took the oaths of office. His resignation of the gown of Billingsgate ward was then accepted, and upon the motion of Sir P. Laurie, seconded by Alderman John Johnson, a vote of thanks and congratulation to Mr. Brown was unanimously agreed to, and the Lord Mayor was requested to call a wardmote, for the election of an Alderman for Billingsgate ward, in the room of the new Chamberlain.

Portsoken.—On Saturday Alderman Thomas Johnson, the late partner in the Romford bank, resigned his gown as the alderman of this ward, and the chairmen of the committees of Mr. David Salomons and Mr. Sheriff Moon received communications from those gentlemen, announcing that they intended to be candidates for the vacant aldermanic gown, and in a short time boards were carried about the neighbourhood of the ward, intimating to the electors that an approaching struggle was

about to take place. The election will be proceeded with in the course of a few days. Mr. Scales, it is also stated, intends to offer himself to the ward.

New Police Court.—Within the last few days orders have been issued for the speedy erection of a new Police-court at Kentish-town, in a position where it will afford facilities for the inhabitants of Hampstead and Highgate. It is stated that, in addition to Hampstead, this court will take in Highgate, Finchley, and the populous districts of Camden and Kentish towns, Holloway, and the entire of the S division, which extends to Barnet. The establishment of such a court will be of great advantage to this portion of the metropolis.

The Black Eagle Steam Vessel.—It will be recollected that, in the description of the royal progress, the Black Eagle steam vessel, under the command of Captain the Earl of Hardwicke, was stated to be several miles astern of the royal yacht on reaching the Nore. On proceeding to sea, Lord Adolphus Fitzclarence made signals for the Black Eagle to advance, and delayed the progress of the royal yacht until both were abreast. His lordship then made signals to start both at the same time, to ascertain which of the vessels would first reach Dundee. The Black Eagle soon showed her superiority over the royal yacht as a sea-going steamer, having gained three miles in six hours against her fast opponent. The Black Eagle continued a-head at the same rate throughout the voyage, and consequently was the first to reach the Frith of Tay. The Black Eagle returned to Woolwich on Friday, under the command of the Earl of Hardwicke.

The Duncombe Testimonial.—One of the first acts of Mr. O'Connell on leaving the Richmond Penitentiary, was to forward his own subscription of 5*l.* to the Duncombe Testimonial, the regulations of that prison having prevented him from doing so earlier. The Repeal Association have also contributed 25*l.* as their subscription to this Testimonial.

Surface of the City of London.—During excavations for the sewers in different parts of the city, information has been gained relative to the depth of artificial ground above the natural surface. The following is the very curious statement relating thereto made by Mr. R. Kelsey in evidence before the Commissioners for inquiring into the state of large towns and populous districts:—Thickness of made ground at Paul's-wharf up to St. Paul's Churchyard, 9 to 12 feet; Watling-street, 11 to 12 feet 6; Bread-street, 17 feet 6; Cheapside, the natural earth was not reached—the cutting varied from 14 to 23 feet; Gracechurch-street, 14 to 18 feet; King William-street, 12 to 17 feet 6; Princes-street, 10 to 33 feet 6; Moorgate-street, 16 feet 6 to 21 feet 6; Fenchurch-st., 15 feet 6 to 17 feet 10; Bishopsgate Within, 9 feet 6 to 16 feet; Fish-street-hill, 5 feet 6 to 18 feet 10; Eastcheap, 12 to 15 feet; Redcross-street, 7 to 9 feet; Barbican, 10 to 13 feet; Cannon-street, 9 feet throughout; Rosemary-lane, 8 to 12 feet; Water-lane, Fleet-street, 5 to 9 feet; Cateaton-street and Lad-lane, 12 to 14 feet 2; streets in Cloth-fair, 4 feet 6 to 12 feet 6; streets in St. Ann's Blackfriars, 4 to 13 feet 3. The plinth of Temple-bar is buried in accumulation. The east end of Newgate-street was lowered about 12 inches when the present Post-office was built. London-wall has in part been raised above 2 feet within the last 25 years. The Pavement and Little Moorfields have been wholly re-arranged within the last 10 years. All the improvements from London-bridge to London-wall have largely altered the surface of the main line, and of the adjacent streets. The north side of what is termed Holborn-bridge, the north end of Farringdon-street, has been raised about 2 feet. Such occurrences as these are distinctly noticeable in some way, but the insensible alterations are equally great and curious; as, for instance, from levels taken in 1770 and 1842, it appears that in Bishopsgate-street Without, at Bishopsgate-churchyard, the surface has risen 2 feet 2 inches in 72 years, but at Spital-square only 12 inches in the same time. The result of this examination is confirmed by the depths of the sewers, as originally built, and as they now measure.

Postage Labels and Envelopes.—The following facts relative to the manufacture of our present postage labels and envelopes may not be uninteresting. The manufacture of the envelope is effected by many powerful yet accurate machines. The paper is pervaded by coloured threads as a security against fraud, and when sent from the manufactory is cut into lozenges by an engine with the utmost precision, at the rate of 60,000 or 80,000 a minute. Previously to being stamped, each lozenge has a notch cut in each side for the convenience of folding; this is done by an angular chisel. The envelopes are then stamped at Somerset-house by a machine which combines the operation of printing and embossing—the invention of the late Sir William Congreve. The last process is the folding and gumming, and a quick hand can fold 3500 a-day. One engraving on the hard steel roller will afford 1680 transfers to soft steel plates; these again will, when hardened, admit 60,000 impressions being pulled upon each, so that one original will afford 100,800,000 impressions of labels. 12 years ago common envelopes were sold at 1*s.* the dozen; now the postage envelope, with its medallion, may be bought wholesale at half a farthing, exclusive of the stamp; and yet, though the manufacture is peculiarly costly, it returns a small profit to the Government. More than 22,000,000 of chargeable letters were posted in 1843; so that, supposing all the letter-boxes in the United Kingdom to be open 12 hours in the day, and to communicate with one large spout, the letters would keep flowing through it at the mean rate of 14 in a second.

Immense Delivery of Letters.—On Monday morning the East and West Indian and American mails all reached London *viâ* the Southampton Railway. The number of letters issued on that morning was unprecedented for one delivery, being upwards of 285,000, and the postmen were not dispatched till nearly 10 o'clock.

East India Company.—A Special General Court of Proprietors was held on Wednesday, at which a resolution passed on the 21st ult. by the Court of Directors, the object of which was to grant an annuity of 1000*l.* per annum to Major-General Sir W. Nott, for his long services in India, was carried by acclamation.

St. Stephen's, Walbrook.—The following account appeared in the *Times* of Thursday, and caused great excitement in the City, as it proved to be a hoax, and called forth indignant denials from Ald. Gibbs and Mr. Rock, followed by an apology from the *Times*. "On Wednesday a meeting of the parishioners of this parish was held to take into consideration the following letter addressed by Ald. Gibbs to Mr. Rock:—"33, Walbrook, Sept. 17. Sir, I beg, through you, to inform the parishoners of the result of the late proceedings in Chancery in the case 'Rock and others *v.* Gibbs,' which has resulted in the Master awarding me debtor to the parish of St. Stephen's to the amount of 3583*l.* 14*s.* It would ill become me, as a magistrate, to animadvert upon this decision, no doubt formed in accordance with that strict impartiality which pervades our superior courts; but I cannot resist, untowardly situate as I am, entering my firm protest against that system of persecution which has been so perseveringly carried on for the last eighteen months against me. To prevent the repetition of the same, I herewith withdraw from any further connection with the affairs of this parish; and, in conclusion, beg to express my sincere and ardent wish, that you may procure an officer equally willing at all times to forward the interest of his fellow-parishioners as, Sir, your obedient servant, MICHAEL GIBBS. Mr. W. H. F. Rock.' The resignation of the alderman was accepted, and Messrs. Rock and Flight, who had been previously chosen by the parishioners, were again elected churchwardens." The above hoax, as might have been expected, caused great astonishment in the parish and in the City generally, and was the subject of much discussion at the regular vestry meeting which took place on Thursday. At this meeting Dr. Croly, the rector, stated that his salary, due for two years past, was still unpaid, and that the lady who officiated as organist had been unpaid by Ald. Gibbs for five quarters, and the sextoness for six quarters. It was also stated that the expense which had been incurred under Ald. Gibbs's management, in keeping up the parish church and providing for public worship, was one-third more than most parishes, and one-half more than many; it was ultimately determined that Ald. Gibbs should be applied to to hand over the money in his hands received since the commencement of legal proceedings, and that a rate should be made, with the concurrence of the four sworn in churchwardens, to provide for any deficiency, and that the parish of St. Benet should bear its fair proportion of the expenses of repairing the church.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Sept. 14: West Districts, 135; Northern, 172; Central, 178; Eastern, 175; Southern, 183; Total, 843. Weekly average for the last five years, 946.

Provincial News.

Berwick.—We learn by the local papers that that venerable monument of antiquity, the ancient Castle of Berwick, is to be levelled with the ground, in order to allow space for the terminus of the railway forming between that town and Edinburgh.

Bristol.—The Bristol papers state with feelings of great satisfaction, and upon what they consider undoubted authority, that arrangements are in progress for the release of the Great Britain steam-ship, from her present untoward situation, and that she may be expected to be floated out of the harbour either in October or the early part of November. They add that it would be premature to state the nature of the arrangements about to be made, but that the above statement may be implicitly relied on.

Chudleigh.—Mining operations have for some time past been carried on in this neighbourhood, for the purpose of raising manganese, and no less than 12,000 tons of this article have been produced at one weighing, which, before its importation was allowed, fetched 12*l.* per ton. In the course of working for this ore, it was imagined that much more valuable lodes than manganese were to be found in the neighbourhood, and an experienced tributor having discovered lodes of lead and copper, a very productive mine is now in full work, from which large quantities of ore have been produced, particularly lead. Large returns have been realised by the Messrs. Williams from this mine, which is situated upon Lord Exmouth's property. Setts have also been recently taken on property situated in the parish of Christow, belonging to Messrs. Hanley, and the miners are now bringing up a new adit.

Gloucester.—It is said that the corporation of this city have arranged to abandon their suit in the case of their extensive claims on the estate of the late Mr. James Wood, of Gloucester, and that the settlement of this long-pending suit is likely to take a most unexpected turn. It is reported very confidently that the real will or codicil, properly attested, is at length forthcoming, and that a family in Worcestershire, of humble respectability, are likely, as heirs-at-law, to become possessed of Mr. Wood's enormous wealth.

Gravesend.—The following is a return of the number of passengers landed and embarked at the Terrace and Town Piers, Gravesend, in the month of August last:—Terrace-pier.—Star Company, with five boats, 95,764; Blackwall Company, with three boats, 86,645; Commercial Company, with one boat, 6273; total, 188,682. Town-pier.—Diamond Company, with six boats, 78,737; Sons of the Thames Company, with two boats, 31,399; Eagle Company, with two boats, 12,024, total, 122,160. Terrace-pier, with nine boats, 188,682; Town-pier, with ten boats, 122,160; gross number of passengers, 310,842; of whom, to and from Blackwall, 213,501; to and from Hungerford-market, Waterloo-bridge, Old Swan, London-bridge, and other places through the Pool, 97,341.

Liverpool.—On Saturday a special general meeting of the members of the Liverpool Medical Institution was held, for the purpose of taking into consideration "A Bill for the Better Regulation of Medical Practice throughout the United Kingdom," introduced into the House of Commons by Sir J. Graham. The chair was taken by Dr. Jeffreys. A long and animated discussion took place, in the course of which it appeared that some diversity of opinion prevails amongst the medical profession throughout the kingdom as to the merits of the proposed measure. It was eventually resolved to convene a general meeting of the medical men of Liverpool, at an early day, to be advertised in the public papers, with a view to the adoption of such proceedings on the subject as might be then considered advisable. Similar meetings have been held in other provincial towns, at which resolutions condemnatory of the Bill have been unanimously adopted.—During the early part of the week, a naval officer, from the Admiralty, was at this port, inspecting the different steamers belonging to the port, in reference to their capacity as war-steamers, in the event of hostilities requiring a resort to such means of defence. He found 61 steamers fully competent to carry 148 large guns, several smaller ones, and a competent number of men; and expressed his admiration of their strength and capacity. The river steam-boats, tug-boats, &c., he pronounced capable of being converted into gun-boats of a most formidable description.

Mallethorp.—The *Stamford Mercury* of last week stated that the costs which the Rev. T. Lovick Cooper would have to pay on his failure in the Mablethorp tithe cause would amount to 7000*l.* Large as this sum may seem to persons unacquainted with the cost of the proceedings in the higher Courts, and particularly in the case of appeal to the House of Lords, it appears that it will by no means pay the costs on both sides which Mr. Cooper will have to defray. He was lately compelled to pay one attorney's bill of 4000*l.* under threat of attachment by the Court; and it is thought that 14,000*l.* will scarcely meet the entire costs of the proceedings, which will fall upon him. He fortunately married a sister of the great capitalist, Mr. Ricardo, and had with her a fortune of 20,000*l.*; but it is said that he still borrowed many sums to carry on the appeal.

Neath.—General Nott arrived in this town on Monday, and received an enthusiastic welcome. Triumphal arches were erected across the streets, and the houses decorated with laurels. The bells rang merry peals, all the shops were closed, and thousands of people collected together to have a sight of the "Hero of Ghuznee," by which term he was loudly greeted. On his arrival, at the entrance to the town he was met by the mayor, magistrates, town-council, and a great number of respectable persons. The horses were taken out of the carriage, which was drawn by men to the inn which was once his home, where many of his youthful days were spent. The mayor then presented the address from the town-council, congratulating him on his arrival, to which he replied, but in such a low tone of voice that little could be heard of what he said. He has been 40 years in India, and appears to labour under severe indisposition. The gallant General, after sleeping at the Castle Inn, left on Tuesday, accompanied by his two daughters, for Carmarthen, where he was received with the greatest enthusiasm. No less than 12,000 persons were present in the procession formed to conduct him into the town. The people drew his carriage through the streets, and the gallant General wept as he received these gratifying marks of esteem in his native town. He said he should have been better able to face the enemy than to withstand such overpowering kindness from his old acquaintances and friends.

Newport.—The daily papers mention as the fruits of the Chartist outbreak that Jenkin Morgan, who, with Frost, Williams, and Jones, was sentenced to be hanged at the Monmouth Special Commission in 1840, for the Newport riots in 1839, but whose sentence was subsequently commuted to imprisonment in the Millbank Penitentiary, has been lately released. When he was arrested he was the proprietor of three houses, had a well stocked farm, and was otherwise most comfortably situated. Upon leaving the prison he found himself and his family houseless, and is now endeavouring to raise a subscription to enable him to support his wife and children.

Oxford.—The daily papers state that a contest is likely to take place on the occasion of the approaching election of a Vice-Chancellor for this University. Dr. Symons, the Warden of Wadham, and next candidate for the office, is to be opposed, on the ground, they state, of his being one of the six doctors who condemned Dr. Pusey without a hearing.

Stockport.—At the Borough Sessions in this town on Monday, Mr. John Kenyon Winterbottom, who was apprehended in Liverpool a few days ago, after having been absent from this neighbourhood since August, 1840, was charged with forgery upon the Pelican Life Assurance Society for the sum of 5000*l.*, which was payable to the family of the late Mr. J. Isherwood, of Marple-hall, upon his death, and which sum was received by the prisoner on his presentation of an authority purporting

to be signed by Mrs. Isherwood and her three daughters. After a long examination the prisoner's counsel admitted that the evidence justified the bench in sending the prisoner for trial; and therefore, as any remarks on this painful matter would be more appropriately, and perhaps more effectually addressed to a jury, he should reserve his defence until he appeared before another tribunal. Mr. Winterbottom was then fully committed to Chester assizes for trial.

Sunderland.—A Government agent has visited this town, and surveyed and approved the site selected by the public walks committee as a recreation-ground for the inhabitants.

Westbury.—At a meeting held in the parish church of this place by the Rev. Canon Fisher, on the 6th inst., the churchwarden reported the great want of clergymen to perform the duties of this large and populous parish, and requested the official, if it came within his jurisdiction, to apply to the lessees of the great tithes to supply a curate from the large revenue they receive in tithes, &c. from the parish. The population of the parish is 8000 persons, three churches to serve, and only one clergyman, whose living has been commuted at 235*l.* per annum. The great tithes and estate held under the church amount to upwards of 3000*l.* per annum, and are held by Mr. White, a solicitor in London, and Mrs. Gabriel, the widow of a solicitor of Calne.

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 3102*l.*; Bristol and Gloucester, 1211*l.*; Eastern Counties, 4461*l.*; Edinburgh and Glasgow, 2614*l.*; Great Western, 19,546*l.*; Grand Junction, 9420*l.*; Glasgow, Paisley, and Ayr, 1859*l.*; Great North of England, 1979*l.*; London and Birmingham, 18,797*l.*; South Western, 7732*l.*; Blackwall, 1415*l.*; Greenwich, 871*l.*; Brighton, 6568*l.*; Croydon, 621*l.*; Liverpool and Manchester, 5648*l.*; Manchester, Leeds, and Hull, associated, 9402*l.*; Midland, 11,093*l.*; Manchester and Birmingham, 3840*l.*; Newcastle and Carlisle, 1712*l.*; Newcastle and Darlington, 1030*l.*; Preston and Wyre, 870*l.*; Sheffield and Manchester, 881*l.*; York and North Midland, with Leeds and Selby, 3317*l.*; Yarmouth and Norwich, 402*l.*—The Aylesbury Company held their meeting last week: The report stated that surveys were in progress for the formation of a line to Worcester from Banbury to join the London and Birmingham Railway. It had been proposed, in order to save a distance of two miles, to cross the Aylesbury line and to join the Birmingham at another place. This, if carried out, would not only entail enormous expense, looking to the nature of the country to be traversed, but would render the Aylesbury railway almost a dead letter. It was therefore suggested that the Aylesbury line should be offered to the new company, or to the London and Birmingham, at the original cost, which was 60,000*l.*; or, in case they should decline that offer, that the acquiescence of the Aylesbury Company in the new line to Worcester should be contingent upon the new company agreeing to make the Aylesbury line the junction with the London and Birmingham. After some discussion a resolution empowering the Directors to enter into negotiations with the Birmingham Company was agreed to, and it was arranged that a special general meeting should be called as soon as the negotiations had ceased. A dividend of 8*s.* per share, or 4 per cent. on the paid-up capital, was then declared. In seconding the resolution for a dividend, a proprietor said he supposed this would be the last dividend that would ever be declared in this Company.—A deputation from the Directors of the Great Western Company arrived in Kingstown last week, for the purpose of witnessing the working of the atmospheric principle on the line from Kingstown to Dalkey. Mr. Russell, M.P. for Reading, chairman of the Great Western Company; Mr. Brunel, chief engineer, with other officers, contractors, &c., were members of the deputation. Lord Courtenay, chairman of the South Devon Company, was also of the party. For nearly six hours the deputation were engaged in their investigations, and departed, it is said, satisfied with the result. The Great Western Company intend to apply to Parliament for liberty to lay down several new branch lines from their main trunk, and to adopt on them the atmospheric system.—The Dublin papers mention another project for the connection of Waterford, Wicklow, and Wexford, with Kingstown and Dublin, by means of an atmospheric railway; and the port of Wexford with Fishguard harbour, in South Wales, by powerful steam-boats. The inland communication with London by means of an atmospheric railway of 120 miles, to join the Great Western at a given point, and from thence to London. The harbour of Wexford to be rendered fit for the reception of steam vessels of suitable tonnage. The distance, it is ascertained, can be readily accomplished in thirteen hours; and thus the Irish traffic to London by the Liverpool and Birmingham and Grand Junction will be fairly divided, and any attempted monopoly defeated. The directory, it is intended, will consist of a certain number of the Directors of the Great Western, the South Wales, and the Dublin and Kingstown railways. This is only the outline of the intended project. A deputation from each of the directions, it is said, intend to meet at Swansea, to adopt measures towards the furtherance of this undertaking, and to facilitate the passing of a bill for the purpose in the next session of Parliament.—Last week a special train, in four divisions, went from Leeds to Hull, and was the largest of all monster trains ever recorded. The number of engines employed was 10, the carriages 250, and the passengers 7800! About 6000 were from Leeds alone, the rest were taken up at the Castleford station. So extraordinary was the crowd at the Leeds station, that two hours, from 6 until 8 A.M., were occupied before the last division of the train could be despatched. Averaging the number of passengers at 2*s.* each—which was the third-class fare to Hull and back, and consequently the lowest computation—the railway company would realise from this pleasure-trip the sum of 780*l.*

IRELAND.

Dublin.—The weekly meeting of the Repeal Association took place on Monday. The building was densely crowded. The Hon. Hely Hutchinson presided, and addressed the meeting at some length. He said that he had been an old and staunch Repealer. He had, twenty-five years ago, considered the Act of Union as a most disastrous legislative measure. Time confirmed him more and more in that opinion, and made him resolved to do away with the wrong and the disgrace which the Act of Union inflicted on this country. The Union was imposed on Ireland in the hour of her weakness. The rebellion of '98 was expressly got up to pave the way for the carrying of that measure. Bribery, intimidation, and every base means were resorted to by the English to take away the Irish Parliament. Large promises had been made to Ireland, but nothing was given but political degradation and social misery. During the period of forty-five years that had elapsed since the passing of the Union, England had resorted to Coercion Bills, and other tyrannical expedients, for the purpose of putting down in Ireland the expression of public opinion; but in this respect England had not succeeded. The ruin of Ireland's trade and manufactures had been brought about by a system of fraud on the part of England, who frightened capitalists from embarking their money in any business speculation in Ireland, by representing that life and property would not be secure in this country. The splendid city of Dublin, which ought to be filled with the mansions and palaces of our noblemen, had become as wretched as Versailles at present—a town in which there were only 30,000 inhabitants, although built for 80,000. He believed there was no remedy for the evils that afflicted Ireland but a repeal of the Union. The late prosecution had failed to put down the popular movement for Repeal. On the contrary, it had given a new impetus to that movement, and there could be little doubt of ultimate success. He did not think any increase in the number of Ireland's representatives would be of any advantage to this country. Such increase would rather be an injury, because it would draw away from the kingdom money in proportion to the number of additional representatives. He saw no remedy for the country's evils but Repeal, and he trusted that object, and that alone, would be sought for by the Irish people. He hoped conciliation towards their opponents would be carried out by the Repealers to the utmost extent; and that, whether in private conversation or public debate, the most moderate language would be used. The Repeal was not to be carried by violence, either in language or conduct, but by patience, mildness, and perseverance. The English were now beginning to see that the Irish had not only a right to manage their own affairs, but that it was for the interest of England that the Irish should, as soon as possible, commence that management. The English people were also beginning to discover that an Imperial Parliament was altogether incapable of managing the affairs of this country. That Parliament was so occupied with the business of England and Scotland that it was quite impossible for it to manage the affairs of this country; and it was an annual subject of complaint that Bills relating to this country were hurried through Parliament at the end of each session in the most rapid, careless, and slovenly way. He only saw two courses open to the English with respect to the future Government of Ireland in the event of their refusing the Repeal of the Union—either more Coercion Bills for Ireland, or the return of the Whigs to power, and a renewal of their old practice of bribery. But the Irish people were determined never to relax in their efforts for Repeal. This was a holy war in which the Irish people were engaged, and as the benediction of Heaven was resting on their efforts, there could not be the slightest chance of failure. Mr. O'Connell, Mr. S. O'Brien, and other gentlemen then proceeded to hand in subscriptions, and a great deal of routine business was transacted. —Mr. O'Brien announced that at the banquet on Thursday the "Repeal of the Union" would be given as a toast, and that neither he nor Mr. O'Connell would attend at any political dinner at which that toast would not be given; but at the same time he did not consider that that circumstance need prevent any Federalist from attending.—Mr. O'Connell concurred with what had been stated by Mr. O'Brien. He should not receive any compliment that compromised his sentiments as a Repealer. He was convinced that a federal Parliament would work well for Ireland, and if not, it would give the Irish the means of doing better.—Mr. M'Nevin spoke at some length on the release of the Liberator, but said he preferred considering it as a triumph of Justice in her ordinary course, rather than a supernatural or miraculous event. They had, he said, restored the Trial by Jury, which but for them would have been made a "delusion, a mockery, and a snare." It required the strong purse of the Association to effect this. For this they thanked God and themselves; they owed nothing to the English people or the Government—it was a matter of necessity.—Mr. S. O'Brien read a notification from the Association, offering rewards for written Essays on Repeal —100*l.* for the best, 75*l.* for the next, and 50*l.* for the third in the order of merit. The Essays to be sent in before the 1st January, 1845; the writers to examine all the bearings of the question, and in particular, "how far the constitution of Norway, and its connection with Sweden, may serve as a model for the new constitution of Ireland." The judges of merit to be Mr. John O'Connell, M.P., Mr. Thomas Davis, and Mr. Smith O'Brien. The hon. member observed, that although the people had heard of the advantages that would result from a repeal of the Union, as yet there had been very little discussion as to the form of government which was to supplant that under which they now lived. That question had been reserved, and with good discretion, as an open question in that hall; and it therefore remained to be considered whether they should seek for a simple repeal of the Union, or a federal connection; or whether their relation to England should be put in the same position as that in which Norway stood towards Sweden. The time was now however come, when the mind of the country should be directed to the executive and legislative institutions which were to follow the repeal of the Union. For his own part, he was glad that the leaders of the Association had not thought it right to impress upon the country any particular views as to the best form of government to be adopted, as soon as Repeal was attained. He thought it much better that the subject should be argued by the public without such direction, and without any bias or impress from any individual. Another useful result likely to arise from the offering of those prizes was, that they might tend to remove in some measure English prejudices against Repeal. It was almost received as an axiom in England, even amongst the most intelligent, that Repeal meant separation and dismemberment of the empire. But the more the subject was dwelt on and considered, the more would it be felt even in England, that Repeal was not only consistent with, but essential to the integrity of the empire. For his own part he must say, however, that he felt that Repeal was only to be achieved by Irish, and not by English opinion. Under that conviction was it that he had so sedulously laboured to unite all classes of Irishmen in support of it. The hon. gentleman then proceeded to show that Repeal stood upon a totally different footing from the question of Catholic Emancipation. That question was supported in a great degree by England, and opposed by a large body of Irishmen, who were interested in maintaining a Protestant monopoly. But, with the exception of the Protestant clergy, there was no class of Irishmen that ought not to support, and who were not interested in supporting, the question of Repeal, as it had for its object the national welfare. Those who advocated that measure were therefore the true friends of the integrity of the empire, for in spite of Mr. O'Connell, or Mr. O'Brien, or any other leader, the alternative which now presented itself to the Minister of England was Repeal or separation. He trusted that the prizes offered by the Association would produce masterpieces of composition, which they would not be ashamed to circulate throughout the world as an exposition of the opinion of this country with reference to its national interests.—Mr. H. Grattan seconded the motion in a long speech, in which he stated, in allusion to the opinion of the majority of the English judges on the O'Connell writ of error, that the judges of England had always decided against the liberties of Ireland. He also observed that it was a folly to suppose that the Recorder of Dublin did not know, and ought not to have known, who it was that stole the jury list, and that Her Majesty's Ministers must not dare to refuse inquiry into that subject.—The motion having been agreed to, and an address of congratulation having been presented to Mr. O'Connell from the Repealers of Liverpool, Mr. O'Connell rose amidst loud cheers, and proceeded to say, that it was then his duty to call the attention of the Association to the matters of which he had given notice on the last day of meeting. They were perhaps too buoyant in their spirits on that day to regulate with care and consideration the mighty concerns of the nation—for the concerns of Ireland were now in their hands. They were arrived at a period when, if they acted with discretion and prudence and propriety, the repeal of the Union was not only certain, but near at hand. He even doubted whether they were able to spoil their cause in any case, it was in so prominent and powerful a situation; but he also knew that an awful responsibility hung over them. The liberty of Ireland was at stake—the prosperity of the people of Ireland was at stake—the restoration to Ireland of her national Parliament was at stake—all the blessings that the constitution could give, and above all, the combination of the different sects and persuasions in one bond of Christian charity and affection—all these important concerns were now at stake. They were arrived at a time when they could be free if they deserved it, and conducted themselves accordingly. They were then somewhat more sober than they had been last week. They had been then naturally warm with the triumph which they had obtained, but more sober thoughts had come upon them since. Every thought and reflection since then had convinced him more and more that the hour of liberty was at hand, and that they should be free if they conducted themselves as freemen ought to do. Their chairman had said well, that their first duty was conciliation. They had every encouragement to conciliate those who were opposed to them. If they looked at the transactions of the last twelve months they would see that there was springing up at every side a disposition amongst Irishmen to combine one with another. He would take his own individual case. When the verdict was found against him, in a manner which he need not then describe, there was no triumph exhibited on the part of those who were called the Orange faction. There was no Orange lodge illuminated—no Orange procession marched forth in commemoration of the triumph.

There were no drunken orgies—no toasts of "To hell with the Pope and O'Connell." There was nothing of that kind done; but three years ago the thing would have been very different. It was but a little more than that time since he risked his life in going along the Queen's highway to Belfast. Three years ago the North would have been in a blaze of triumph at his conviction. Now there was no triumph of the slightest kind. Such neutrality, if it went no further, was a matter that they ought to hail as a harbinger of better days to Ireland. He rejoiced in that neutrality. He was grateful for it. He thanked the Orangemen for their forbearance, and he expressed his strongest gratitude to them for that proof that they were becoming more Irish than they had been formerly, and that they, at least to his sense, held out a prospect of better days for their common country; but what had since occurred? Since he had been liberated, had the popular triumph been marked by any discontent on the part of those who opposed them? Had there been a meeting held to express their resentment at the manner in which the ultimate success of the cause of the prisoners had been attained, or to disparage the conduct of those through whom that success had been announced? It was quite the contrary. He was proud to say he had received the congratulations of persons who had been formerly opposed to him, and whose politics were even yet not identified with his. He was proud to say, that many who would formerly rejoice in his conviction had joined in the illumination that had followed his liberation. These were excellent symptoms, and they ought to do everything to insure a continuance of them, by reciprocating the kindliness that was extended towards them by those who were formerly opposed to them. The first subject which he had to bring before the Association, in pursuance of the notice of motion he had given on the last day of meeting, was that it be referred to the committee to report on the necessity of holding the Clontarf meeting. He had preceded the announcement of that subject by describing the increasing disposition of mutual forbearance among all classes of the community, as one of the strongest motives for regulating the future conduct of the Association in calling or not calling that meeting. His own opinion was that the Clontarf meeting was now unnecessary; and he was sure if it were not necessary it ought not to be persevered in, as it would be considered to have too much the appearance of triumph and defiance. That meeting had been legally convened; its purposes and its objects were legal; and its suppression was unjustified by law and unsanctioned by any constitutional principle. Need they now vindicate that principle? He thought not; and for this reason, that the indictment itself had done so. The first five counts of the indictment declared their meetings to be illegal, but the counsel for the Crown were obliged, in open court, to consent that those counts should be pronounced falsehoods, and that they should be acquitted of the charges of holding illegal meetings. The principle was therefore already established, and they were therefore under no necessity of vindicating it. They would thus show to their fellow-countrymen of every religious persuasion their anxiety to take no step in promoting the Repeal cause that was not absolutely necessary for its success. He would impress this upon his Protestant fellow-countrymen. But why should he mention them when he had more Protestant gentlemen sitting near him than Catholics? They had 41 monster meetings. They held them with perfect tranquillity and the absence of the slightest breach of the peace or violation of order. Not even a single accident occurred at any of them—their purpose being to show to the British Parliament and to the people of England the conviction of the great majority of the Irish nation that their country was misgoverned, and that the Union ought to be repealed. They had demonstrated that completely, and therefore, though he would go through the form of referring the subject to the committee on account of its importance, it would be with the anticipation that the committee would decide as he had done, that the Clontarf meeting would not now be necessary. The next subject to which he had to refer was the formation of a Preservative Society. He thought that Society ought to be formed of men who would make a sacrifice for the service of their country, and he thought it would be well that they should be entirely distinct from that Association; that each should be distinct from and uncontrolled by the other. He wanted to give the principle of fixity to their arrangements, and to remove the impression that any of the institutions of the country were to be injured or disturbed by the repeal of the Act of Union. If there was one thing that would tend more than another to inspire confidence, it would be in having persons of property formed together in an association for the re-establishment of an Irish Parliament. He agreed with his friends Mr. Grattan and Mr. O'Brien, that a continuance of the Union would cause a real danger to property, but he did not go so far as Mr. O'Brien when he said that he would only resist separation as long as he could resist it. For his (Mr. O'Connell's) part, he would never consent to separation under any circumstances, and he would give up Repeal to-morrow if he thought it would lead to such a result. On the contrary, one of his reasons for working for the Repeal was, that he was most firmly convinced that it would be the only means of maintaining the connection between the two countries. He then read several extracts from Mr. Gray Porter's pamphlet on Federalism, in support of the same opinions, and continued to say that the Preservative Society, acting like a kind of House of Lords, would, when brought into operation, be most advantageous in removing all false impressions and alarms from the minds of the landed proprietors of the country. The third subject which he had to bring forward was, that of the impeachment of the Ministry. With respect to the Judges, he thought the better course would be to have an address to the Crown from both Houses of Parliament for their removal, as was the case in the removal of Sir Jonah Barrington. That would be the most constitutional principle, as it would require an inquiry before Parliament in the first instance. He had heard, whilst sitting in the gallery of the House of Commons, that if Catholic Emancipation was carried, Protestant property in Ireland would be destroyed. Had that statement proved correct? No; and the fears now entertained with regard to Repeal of the Union would prove equally groundless. Now, it was important that those who thought that the value or stability of property would be injured by Repeal should become acquainted with what he told them emphatically, that the Repeal would not injure either one or the other, but that by it the Irish people would have the benefit of Irish taxation, and he did not think that man worth conciliating who did not think that worth striving for. He would now come to the address to the people of England, and the impeachment of the Attorney-General. There was no need for him to enter into the details of the trial—but he wanted to know this: they had heard much of English sympathy. He was loaded with letters, telling him that he was wrong in fixing on the English people the faults of their governors, and that he should not have used such harsh language towards them. Now, he must remind the English people, with all respect, that they had borne with the greatest patience that the *Times* should lavish the foulest abuse upon their Irish brethren, and should call their priesthood "surpliced ruffians—hooded incendiaries—monkish assassins," and themselves "felonious multitude." Now, if he called them Saxons, was it not a very mitigated term, compared with the language he had quoted from the *Times*, at the period when writing the Whigs out and the Tories in, which it mainly succeeded in by exciting a spirit of anti-Irishism and a No-popery cry in England? Saxon was no term of reproach. It was an honoured name, and the purest portion of liberty was derived from Saxon laws and institutions—the parliamentary system, trial by jury, and the shrievalty; but even if it were a disgraceful name, was not "felonious multitude" rather worse? Was not "hooded assassins" as bad as Saxon? Was not "monkish tyrants" and "surpliced ruffians" quite as strong as Saxon? He would remind them how he was received in England during the discussion of the writ of error—he was received most kindly and cheered in his exertions. He proceeded to eulogise the Covent-garden Theatre dinner, and the warmth of his reception at various times in England. He was, he continued, now arrived at the time when he would test the English. There should be no more discussion one way or another as to what their feelings towards Ireland were. On this question they would either join Ireland or not, and one way or another the public mind would be tested. He told England from that place, that if she joined them they would do her ample justice, and would sound her praise in shouts whose echoes should reach themselves again. They would pray that she might be great and powerful—that she might obtain every advantage in peace and victory in war. He promised them in return the lion heart and stout hand of Ireland. He promised them her glowing intellect and the congregation of her virtues—her temperance, her morality, her chastity. He promised them the whole of these, if they joined Ireland in obtaining the victory over injustice. He had a right to expect it. Supposing that the member for the East Riding of Yorkshire and the member for Bath, Mr. Wilson of the Corn-law League, and the proprietors of the *Morning Chronicle*, *Advertiser*, and *Globe*, as well as the Secretary to the League, were indicted together, hurled into a dock together, not allowed to appear by attorney, but were treated like so many sheep-stealers, and were tried by a jury of their political opponents—Mr. Wilson, for instance, by a jury of tenants of the Duke of Buckingham, selected by the Duke himself—that they were sent to gaol for three months without a shadow of law to warrant it, as seven of his friends were—for where, he asked, was the authority to do it?—what right was there to do it?—what a cry would have been raised from one end of England to the other; the very stones in her streets would have raised their voices. The English had a quick way of remedying injustice. Had such a thing occurred there, the people would have raised one universal cry, and instead of asking for inquiry, would demand where was St. James's or Buckingham Palace? England would have vindicated justice, and, turning out her myriads, she would have driven her tyrants from their seats, however lofty. Now, was the Member for Yorkshire in any way a more free-born subject than his son John? As for himself, he was born in slavery; but his son was born free: or was he not as much entitled to protection as the Member for Bath? If not, what became of the Union? Let the people of England give up the humbugging idea of deluding Ireland, and either join her heart and hand, or allow her to consider them as her bitterest enemies. Her bitterest enemies, he said, because England stood between them and her oppressors, and would not remain neutral. England, however, must now take a part with them or against them. He offered her the allegiance of the Irish people, which would make Louis-Philippe tremble on his throne, and would wipe away the disgrace of Mogador. But he had his price. He was to be bribed, and his bribe was justice. In return for that he would make England the greatest of nations. He was amused with a passage of the judgment of the House of Lords, wherein they commanded that he and his fellows "should be restored to all that they had lost." There was the solemn judgment of the House of Lords for them. How could they give him back three months of his life? An inch was a good deal in a man's nose, and three months was something at his time of life. They might stop the clock, but not the flood of time. What could they do? They could punish the authors of the wrong, whom he would be ready to forgive when they acknowledged their offences. Having alluded to the peaceable state of the country, and ridiculed the idea of a Coercion Bill, and of his abstaining from agitation, as recommended in the *Sun*, Mr. O'Connell proceeded to argue that he had been convicted of fifteen crimes by the Jury, where only five were charged against him. A gentleman had asked him the day the verdict was returned if it were really true, and on hearing that it was so, he asked him (Mr. O'Connell) have the Jury convicted you of the murder of the Italian boy? No, said he (Mr. O'Connell), because they were not asked. Having referred to other circumstances of the state trials, and inveighed against Judge Burton and the other Judges, Mr. O'Connell concluded a lengthened speech by a vivid picture of the triumph of the Irish people when their Parliament should be restored to them. After some further business had been disposed of, Mr. O'Connell announced the rent for the week to be 715*l*. —It is rumoured in Dublin that the Whigs have made overtures to Mr. O'Connell, offering to support him if he will be content with a federal Parliament; and many of the leading Repealers show a disposition to abandon unconditional legislative independence as impracticable, and to content themselves with its shadow in the form of a federal Parliament. Mr. O'Connell has already expressed his willingness to accept a "grand jury" Senate as an instalment; and even thus early the more violent Repeal organs begin to look upon the matter in the same favourable light as their leader appears to regard it. One of these papers says, "Another striking circumstance which has occurred, is the junction which is alleged to have taken place between the Whig and Federalist party. One of the few elements of strength which was wanted in our Repeal movement was an English party. The English people are the arbiters of the question. It would greatly increase the certainties of its success if there were an English party; and it appears that we are likely to be supplied with such an auxiliary immediately. The Whigs of England can never hold the reins of power without a union with the Repealers. The latter virtually rule the empire, and if they be wise, they will continue to do so, until they are permitted to rule their own country. The Whigs have the usual exigencies of a party, and must have power. We are authentically informed, by one of their own organs, that a union with the Federalists is debated, if not decided on. We shall not then be long without seeing the last great act of the political drama."—Mr. O'Connell has caused the bed on which he slept during his incarceration to be removed to Merrion-square, and has supplied Mr. Cooper, the deputy-governor, with a new one instead, declaring that he would keep it as a memorial for his children.—A rumour has been prevalent in Dublin for the last few days, that the Premier is about to confer the dignity of a peerage upon Chief Justice Doherty, that the Ministry may have the aid of his abilities in the House of Lords.

Cork.—On the 26th ult. Capt. Warren, an officer in the army, residing at Cove, entertained a number of friends at his residence, where a ball and supper was also given to a large and fashionable party, including a number of naval and military officers attached to the Irish squadron, now stationed in Cove. Several articles of valuable plate disappeared after the ball, and it was supposed that some of the servants, carmen, boatmen, or others, whose services are usually required on such occasions, made free with them, and nothing more could be done than to circulate a description of the property, and acquaint the police with its abstraction. Up to Saturday last nothing more was heard about the matter; but on that day a respectable female entered the shop of Mr. Hawkesworth, Grand-parade, and offered for sale, as old silver, some pieces of forks and spoons, which were much battered, and the part where plate is usually marked evidently hammered with a blunt chisel, or some such instrument, with a view of defacing the marks. Mr. Hawkesworth, who is an extensive silversmith and watchmaker, had before him at the time a strong magnifying lens, with the aid of which he was at once able to trace the crest on one of the pieces, and on another the initials, as described in the bills. He told the lady who brought it that there must be some mistake in the matter, as he could distinctly identify the articles as Capt. Warren's property. To this she at once said it could not be the case, for that it had been given her that morning by an officer of the Royal Marines, to sell as some old silver, which he had a long time in his possession, and had no other use for. She informed Mr. Hawkesworth that she was the wife of a gentleman holding a Government situation in the Ordnance Store Department at Haulbowline Island, and that she was entirely unaware of the property having been come by improperly. Mr. Hawkesworth having been assured of this from another quarter, expressed his regret that she should have been subjected to any trouble or annoyance, and the lady, on her return home, acquainted her husband with the matter, who at once made a report in writing of the occurrence to the commanding officer on the island, through whom it was transmitted officially to the Admiral, and at an early hour on Sunday morning an order was issued from the Admiralty-office at Cove to put under arrest Lieut. Robert Paddicombe, a young man of re-

spectable family who entered the service in 1834, and had previously given his family trouble by his irregularities. Lieut. Puddicombe was at once put under arrest, and examined before the magistrates at Cove. He asserted in his defence that the articles were his own property, and had been in his possession for a year and a half, but the magistrates committed him to the county gaol to take his trial for the robbery. They consented, however, to take bail, but Mr. Puddicombe could not find two persons willing to become his sureties in the sum of 20*l.* each for his future appearance, and was consequently sent to prison.

Miscellaneous.

British Archæological Association.—Thursday was set apart by this Association for visiting objects of archæological interest in the city and its neighbourhood. The chief of these were Richborough, Barfreston church, and the cathedral, under the care of Professor Willis. The party to Richborough, the *Rhutupium* of the Romans, comprised the Dean of Hereford, Dr. Buckland, &c. This ancient station has acquired fresh interest from the researches of Mr. W. H. Rolfe, of Sandwich, a descendant of Boys, the historian, who has assiduously explored the locality. The feature of the afternoon's excursion was a visit to the celebrated collection of Dr. Fawssett, of Heppington, on the Roman road to Lymene. The members of the Association, aided by Dr. Buckland and Mr. R. C. Smith, made a minute examination of this collection, which is particularly rich in objects which throw much light on the arts of the Anglo-Roman and the Saxon epochs. The church of Barfreston lies about two miles from Canterbury, and is well known for the beauty of its decorations, and fine doorway. The church of Follartin is supposed to be that in which Christianity was first taught; and, from the walls being built principally of Roman brick, is supposed to have formed part of a Roman temple anterior to its introduction. It is the church in which Queen Bertha performed her devotions; it formerly consisted only of a chancel, to which a nave has since been added; and there is a finely-decorated stone font in the latter which is much decayed. Near this are the fine remains of the abbey of St. Augustin, which had many extraordinary powers conferred upon it by the bulls of Popes, in one of which it was called the first-born, or the first or chief mother of monasteries in England. The cathedral, with its numerous contents and varied decorations, was an object of great attraction, every part having been thrown open by the liberality of the Dean and Chapter to the inspection of the members. On Friday the Historical Committee met in the Town-hall, at which several papers were read. The primeval section also met under the Presidency of the Dean of Hereford. Professor Buckland made a communication on the recent discovery of a Roman town with an adjacent temple, fortifications, and cemetery, in Dorsetshire, by Mr. Medhurst. It was situate at Jordan-hill, in the parish of Preston, but was now covered by an arable field. The position of the cemetery was two miles from the site of the town. It was impossible to pass the plough over the spot from the obstruction offered by the foundations. Great quantities of bones of birds, sheep, and oxen, the latter chiefly of bulls, were found in some excavations, which had evidently been the relics of former sacrificial offerings in the temple. These had been made use of by the farmers for manure, who also since the discovery had removed a great portion of the stones from the foundations for the erection of walls and bridges. Amongst other novelties he also alluded to the large deposit of oyster-shells, a fact which could only be accounted for by the circumstance that this fish was a favourite food of the inhabitants. The further investigation of these novel and interesting remains Professor Buckland considered would be worthy the attention of the Society. He next referred to the continuous series of camps along the line of the Chalk Hills extending from Wiltshire to Dorsetshire, which often alternated Roman and British. It was his opinion that Weymouth was formerly one of the chief Roman settlements in the kingdom, and that it would eventually, from its peculiar position, become again a port of considerable importance. In the evening the great object of attraction was the unrolling of an Egyptian mummy at the theatre, by Mr. Pettigrew, who commenced with a lecture on embalments in general, which was illustrated by hieroglyphic diagrams. The mummy was brought over by Colonel Needham from Thebes. The process, however, has been often described, and the present was not possessed of any peculiar feature of novelty. On Saturday the routine business connected with the close of the proceedings was transacted, and resolutions of thanks were passed to the officers, after which Lord Albert Conyngham, as the President, announced that the session had terminated for the present year.

Law.

CENTRAL CRIMINAL COURT.—*The Case of Shooting in Holborn.*—The *Hon. William Ross Touchet*, charged with shooting Mr. Thomas Smith, in Holborn, was, by desire of his counsel, Mr. Clarkson, placed at the bar. Before the indictment was read, the learned counsel said he had to apply to their lordships for a postponement of the trial of the young gentleman until next session. The ground on which he made this application to the court was, that the prisoner was not at present prepared to enter upon his defence. He had been attended since his committal by Dr. Warburton and another physician, in order to ascertain the state of his mind, but unfortunately, Dr. Warburton having been seized by a violent attack of gout, sufficient time had not elapsed to enable the medical gentlemen to make a satisfactory report. It was also sworn on affidavits by the prisoner's solicitor that he could not go with safety to trial without the evidence of Dr. Warburton, and that it was impossible for that gentleman to attend during the present session. He (Mr. Clarkson) believed there would be no opposition to this motion on the part of the prosecution. Mr. Charnock, counsel for the prosecution, said he had not seen the affidavits, but he had no doubt they were correct, and therefore he should not offer any opposition to the trial being postponed until the next session. Mr. Justice Wightman, after consulting with Mr. Justice Cresswell, ordered the trial to be postponed until next session. The prisoner, who is a young man of a very mild and prepossessing appearance, and 21 years of age, was then removed from the dock. He seemed quite indifferent to what was passing. Mr. Smith, the prosecutor, was in court, and appeared very weak from the effects of his late wound.

SPORTING.

DONCASTER RACES.—*Monday.—Fitzwilliam Stakes* of 10 sovs. ea., with 50 added; for 3 yrs old, 7st. 5lb.; 4 yrs, 8st. 5 lbs.; 5 yrs, 8st 12lb.; six yrs and aged, 9st. (5 Subs.) Mr. Salvin's Alice Hawthorn, 6 yrs, beat Duke of Richmond's Lothario, 4 yrs; Colonel Cradock's Peggy, 4 yrs; and Mr. Meiklam's Trueboy, 4 yrs. Won in a canter by eight lengths.—*Match*, 150 sovs. each, h. ft. 8st. 7lb. each. Lord Chesterfield's ch. f. Lady Wildair beat Lord Glasgow's b. f. Sister to Pathfinder, by twelve lengths.—*Her Majesty's Plate* of 100 guineas, for three yr. olds, 7st. 9lb.; 4 yrs, 9st.; five yrs, 9st 9lb.; six yrs and aged, 10st. Four miles. Mr. Salvin's Alice Hawthorn, 6yrs. walked over.—*Match*, 2000 sovs., 12st. each. Mr. H. Johnstone's William le Gros, 5 yrs, received forfeit from Mr. Jaques's A British Yeoman, 4 yrs.—*Champagne Stakes*, of 50 sovs. each, h. ft., for two yrs old colts, 8st. 7lb.; fillies, 8st. 5lb. (37 Subs.) Mr. Worthington's Lancashire Witch beat Mr. Ramsay's Mid-Lothian, and 10 others. After some delay they started tolerably well, Mid Lothian, Hope, and the Rebecca colt, in advance. After running about two thirds of a distance, however, Lancashire Witch went up to Mid-Lothian, and they went on together, fairly singled out, to the end, contesting the race so closely, for the last one hundred yards, that the mare won only by a neck. Alaric was a bad third, Rebecca colt fourth, Pantasa fifth. Gossamer and the Mouche colt were beaten early. The winner is in the Oaks and St. Leger, and the second in the St. Leger.—*Plate* of 50*l.* for Horses that never won a Plate or Sweepstakes; three yr olds, 7st. 7lb.; four yrs, 8st 7lb.; five yrs and upw., 9st. Mr. Smith's Dr. Taylor, 3 yrs, beat Mr. Robertson's Little Fairy, 3 yrs; Mr. Owen's Joe Raphael, 3 yrs; and Mr. Hodgson's Sir Isaac, 3 yrs.

TUESDAY.—*Cleveland Handicap*, of 20 sovs. each; h ft, and 5 only if declared, with 60 added by the Corporation; the second to save his stake, and the winner to pay 10 sovs. towards expenses. (24 subs. 11 paid.) Mr. A. Johnstone's Rowena, 3 yrs, 5st 8lb beat Mr. Jaques's Semiseria, 4 yrs, 8st 6lb; Mr. Irwin's The Pride of Kildare, 3 yrs, 6st 2lb, and Lord Chesterfield's Knight of the Whistle, 6 yrs, 9st, won by a neck.—*The Great St. Leger Stakes* of 50 sovs. each, h ft, for three-year-old colts, 8st 7lb; and fillies, 8st 2lb; the second to receive 200*l.*; the third to save his stake; and the winner to pay 100*l.* towards expenses. (108 subs.) Mr. Irwin's Foig-a-Ballagh, by Sir Hercules, beat Mr. Williamson's The Cure, by Physician, and Col. Anson's The Princess, by Slane. The following also ran, but were not placed:—Mr. Meiklam's Godfrey, by Inheritor; Mr. Standish's Little Hampton, by Hampton; Lord Glasgow's br c by Velocipede, out of Amulet; Mr. John Scott's Bay Momus by Bay Middleton; Mr. J. Hampson's Lightning, brother to Timoleon, and Duke of Richmond's Red Deer, by Venison. The contest was entirely between The Cure and the winner, who beat by a length. The Princess was beaten half a length from The Cure, and was about a length in advance of Lightning and Red Deer; the Amulet colt was sixth, and Godfrey last. The race was one of the slowest ever witnessed, and in the opinion of many competent judges was run to suit the favourite—had the pace been good, it is doubtful whether he would have been second. Value of the stakes, 2625*l.* Mr. Irwin wins upwards of 12,000*l.* on the race, independent of the stakes. Mr. Forth, the trainer, and several gentlemen connected with the stable are also large winners. Previous to the race, Col. Anson called upon the Stewards to order an inspection of Foig-a-Ballagh's mouth, which was done accordingly, when the examiners declared that he was only three years old. The reason given by Col. Anson for adopting this proceeding is, that as Mr. Forth had "trained and started a four-year-old colt for the Derby and a four-year-old filly for the Oaks, without knowing that they were four years old, he might possibly make a similar mistake for the St. Leger." It is also said that in any weight for age race in which Colonel Anson and Mr. Forth may have horses engaged, the Colonel intends to pursue the same course.—*Selling Stakes* of 10 sovs. each, with 30 added by the Corporation; three-year-olds, 6st 12lb; four years, 8st; five years, 8st 7lb; six years and aged, 8st 10lbs; the winner to be sold for 200, &c. (5 subs.) Mr. Denham's Harriet, 3 yrs, beat Mr. Dawson's nd br c by Liverpool, 4 yrs; Mr. Meiklam's Poussin, 4 yrs; Lord Chesterfield's Joan of Arc, 3 yrs, and Mr. J. Osborne's Boniface, 3 yrs. Harriet was never caught, and won in a canter by two lengths; but dropped the moment she was pulled up, and died in a few minutes.—*Corporation Plate* of 60*l.*, the second to receive 18*l*; three-year-old, 6st 10lb; four, 7st 12lb; five, 8st 5lb; six and aged, 8st 12lb. Mares allowed 3lb. Heats, two miles. Mr. Meiklam's Aristotle, 5 yrs, beat Mr. Smith's Doctor Taylor, 3 yrs.

WEDNESDAY.—*Match*, 200 sovs, h ft, 8st 7lb each. Red House in. SHADWELL, Esq., many years magistrate and Deputy-Lieutenant of Sussex, aged 79.

WANTED, at Michaelmas next, a steady, respectable Man, as GROOM and GARDENER (in-door servant), who perfectly knows his business. Good character will be required.—Direct, post paid, to J. B., Post-office, Gosford, Kidlington, Oxford.

TO SEEDSMEN'S ASSISTANTS.

WANTED, in a highly respectable Retail Seed Establishment, in the North of Ireland, an active young Man, capable of superintending the general trade; one having filled a situation in an English country town would be preferred.—Address in own handwriting, with full particulars, D. R., Box 28, Post-office, Cheltenham.

WANTED, by a Gentleman in Devonshire, a first-rate WORKING BAILIFF, to superintend a Farm of about 300 acres. He must be thoroughly acquainted with the improved husbandry of the present day, and must have his employer's interests as much at heart as his own; be able to write a good hand, be correct in his accounts; a judge of cattle, both in buying and selling; of honest character, and of sober and industrious habits. A married man, with a wife competent to take charge of a Dairy and Poultry is required; an excellent house, with garden-ground, and wood for firing will be provided. Should this Advertisement meet the eye of one who can bring an unexceptionable character from his last employer, he may apply by letter, pre-paid, to J. L. TEMPLER, Esq., Torr Hill Cottage, Ivybridge, Devon.

WANT PLACES.—All Letters to be post-paid.

AS LAND-STEWARD or MANAGER.—A middle-aged married Man, who has for 12 years had the entire management of one of the largest farms in East Lothian, where he has had the most extensive experience in the breeding and feeding of Stock, and in the draining and cultivation of land, on the most approved principles. The most satisfactory references as to character and thorough practical ability can be given, to his present and late employers, and from several of the most eminent agriculturists in the South of Scotland. The advertiser will be at liberty from his present situation at Michaelmas next.—Direct to J. D., 151, Oxford-street, London.

AS GARDENER.—An active, industrious, married Man, who is conversant with the thorough management of Hothouse and Greenhouse, Kitchen, Fruit, and Flower-Garden, and every branch of the business; and can have an undeniable character.—Direct to Messrs. WM. WOOD and SON, Nurserymen, Maresfield, near Uckfield, Sussex.

AS GARDENER.—A Single Young Man, a native of Scotland, who has lived in his last situation in the neighbourhood of London 3½ years; understands his business in all its branches, having gone through a regular course of experience in several of the best situations in Scotland.—Direct to A. L., Mr. Halley's, Nurseryman, Blackheath.

AS GARDENER.—A Married Man, aged 34, who has a competent knowledge of the different branches of his profession. For particulars, &c. reference may be made to Sir HENRY FLETCHER, Bart., Ashley-park, Walton-on-Thames, Surrey, with whom the Advertiser has lived in the above capacity for nearly 8 years.—Direct as above.

AS GARDENER.—A Married Man who understands the management of Flower and Kitchen-gardening, has no objection to take charge of a Horse, or milk a Cow; can have 3½ years character from his present employer.—Direct to G. C., Post-office, Welling, Kent.

AS GARDENER.—A Single Man, aged 27, who has had considerable experience in the several departments of Forcing, Cultivation of Plants, and in the management and arrangement of the Flower-garden; has a thorough knowledge of the principles of Tree Culture. No single-handed place will be accepted. — Direct to S. P. H., at Mr. E. Sayer's, Hallingbury-gardens, near Bishop's Stortford, Essex.

AS GARDENER.—A young Man, aged 21, who has had nearly five years' experience under a good gardener, has no objection to attend to a horse and chaise, and can have an unexceptionable character.—Direct to A. B. C., Mr. R. Cowen, near the Brewery, Leyton, Essex.

AS GARDENER.—A Married Man who has a good practical knowledge of his business; can have seven years' character from the gentleman he has lately left. Can be highly recommended by Mr. GREEN, gardener to Sir E. Antrobus, Cheam, Surrey, by whom all letters will be received.

AS GARDENER.—A Man, aged 35, of first-rate ability, who has had extensive practice in Forcing of all kinds, both in England and Scotland, and a thorough knowledge of Flower and Kitchen Gardening; has no objection to manage Meadow Land if required. Any Nobleman or Gentleman who may answer this, will oblige by stating their Terms. Highly respectable reference can be given as to character and ability.—Direct to A. B., 20, Hill-st., Park-road, Regent's-park.

AS FARMING BAILIFF.—A young Man wishes for a Situation at Michaelmas. He can have the strongest recommendation from his present employer, for whom he has been superintending a Farm of 600 acres for upwards of two years, and is well acquainted with the management of labourers, rearing and fatting stock, and would make himself generally useful.—Direct F. E., Thorpe Abbott's Hall, Scole, Norfolk.

AS SHOPMAN.—A Young Man, aged 24, is desirous of obtaining a situation as above; he can be recommended by the gentleman he has lived with 2½ years.—Direct to A. Z., at the Office of this Paper.

ANY Nobleman or Gentleman in want of a Man of general knowledge to manage his Gardens and Domain generally, may hear of a person competent to undertake the same by applying to W. R. WHALE, Elcot, Hungerford; an unexceptionable character can be obtained from his present employer, whom he has had the honour of serving for twelve years. He is leaving in consequence of the property being disposed of. The Advertiser is single, and middle-aged.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

A Stamped Newspaper of Rural Economy and General News.—The Horticultural Part Edited by Professor Lindley.

GARDENERS' CHRONICLE.—To be Sold, a bargain, the three First Volumes of the Gardeners' Chronicle, complete and in good order, unbound, for 3*l*. 10*s*. Apply, if by letter pre-paid, to Mr. Jennings, Florist, South Lambeth-road, Vauxhall.

SUPERB DOUBLE HOLLYHOCKS.

WILLIAM MAY begs to announce that he is now prepared to send out his collection of the above splendid and showy plants, of all the various shades of colour, from black, or dark, to white. As his stock is large, he is enabled to supply them upon very moderate terms, viz., 42*s*. per 100.

N.B.—As this plant is becoming popular as a show flower, W. M. has a few very select varieties, by name and colour, at 20*s*. per dozen, which he has selected for the purpose of exhibition. Also Seed selected from finest double flowers, in packets at 2*s*. 6*d*. and 5*s*. each, post-free. The above may also be had by order of the principal Seedsmen in London, and of Mr. Watkinson, Market-place, Manchester. A remittance or reference from unknown correspondents.

Hope Nursery, Bedale, Sept. 25.

MR. HOYLE'S NEW SEEDLING GERANIUMS.

MR. MILLER begs to call attention to the Advertisement of these splendid flowers in last week's *Chronicle*, and also states that printed Lists, giving full descriptions, are now ready, and may be had Gratis.

Providence Nursery, Ramsgate, Sept. 26.

NEW ALONA CÆLESTIS.

J. J. BEST begs to inform the Trade, the Public, and his Friends in general, that, having taken (as successor of Mr. Henry Hamond, who is retiring from business) the Abbey Nursery, Reading, Berkshire, he intends, if possible, sending out (middle of October) established plants, in 60-pots, of that Gem of Greenhouse-plants — Alona Cælestis. The above is figured in the "Botanical Register" for September, "Paxton's Magazine," "Plant's Florist's Journal," and "Harrison's Cabinet" for October. Alona Cælestis is a half-hardy evergreen greenhouse-shrub, from Chili; flowers, sky-blue; the size and shape of a Petunia; a good erect habit, and freedom of growth; has proved a perpetual bloomer since May last, and likely to continue much longer. Price One Guinea per plant; the usual discount to the Trade, when two plants are taken at once. Early orders are respectfully requested, as the Stock is very limited; one-third of the value will be taken in Stock from Trade orders.—Direct to J. J. Best, Abbey Nursery, Reading, Berks, September 25.

SUPERB SHOWY SEEDLING CINERARIAS, for this autumn and winter flowering.

Dwarf, bushy plants, well trussed for bloom, in 32-sized pots, 12*s*. per dozen.

Do. do. in 48-sized pots, 9*s*. per dozen.

The above can be confidently recommended as being saved from the very choicest and most superb kinds, comprising every shade of beautiful light and dark-blue tints, and admirably adapted for the furnishing of the greenhouse or drawing-room, throughout the autumn and winter months. Seed selected from the same, 2*s*. 6*d*. per packet.

THUNBERGIA CHRYSOPS. — Plants of this beautiful Creeper, rich purple flower, with golden eye, 7*s*. 6*d*. each.

M. B. has a large stock of the following STRAWBERRIES:—

Myatt's British Queen	6*s*. per 100.
Do. Eliza	6*s*. ,,
Emperor, variety from Keen's Seedling	3*s*. ,,
Green-flesh Pine, small fruit, fine flavour	3*s*. ,,
Elton Pine	2*s*. 6*d*. ,,
Keen's Seedling	2*s*. 6*d*. ,,

Applications, including post-office orders, will be immediately and carefully executed, addressed to Michael Brewer, Sen., London-road Nursery, Cambridge.

HYACINTHS, &c.

JOHN THATCHER and SON, Seedsmen, &c., 33, High-street, Islington, respectfully inform the Nobility, Gentry, and the Public generally, that they have imported a large and choice collection of Dutch Flower-roots, consisting of Hyacinths, Narcissus, Jonquils, Tulips, Anemones, Ranunculuses, Crocuses, &c., Catalogues of which will be delivered post-free on application. Also that they are manufacturers of all kinds of Fishing and Fowling Nets. Hays for Rabbits, Horse Nets, &c.

THE NEW SUPERB SEEDLING PICOTEE,

"BURROUGHES'S DUKE OF NEWCASTLE."

YOUELL & CO. have much pleasure in announcing they will send out for the first time the above splendid light-edged purple Picotee, raised by the Rev. J. Burroughes. It is guaranteed to surpass any Purple Picotee that has yet been raised. Without commenting further upon its superiority, Y. and Co. beg to refer to a report in a late No. of the *Gardeners' Chronicle*, as follows:—

"The *Duke of Newcastle* is a flower of first-rate properties; it is a light-edged purple; the petals are large, and of good form and substance; even on the edge; the colour unbroken; the pod good, and with less disposition to bar than is common." It obtained the first prize, as the best seedling, at the Norfolk and Norwich Horticultural Exhibition. Price 21*s*. per pair. The stock being limited, to prevent disappointment early orders are respectfuly requested. Y. & Co. are also enabled to supply the following superb Picotees, raised by the same gentleman, all possessing first-rate properties, and having been exhibited and obtained first class prizes at several of the metropolitan Exhibitions of the present year. They are as follows:—

		s.	*d*.
Burroughes's	Mrs. Benyon, Red Picotee	7	6
,,	Lady Alice Peel, Rose Picotee	7	6
,,	Miss Jane, Purple Picotee	7	6
,,	Mrs. Bevan, Red Picotee	7	6
,,	Enchantress, Scarlet Picotee	5	0

CARNATIONS AND PICOTEES.

Y. and Co.'s collection of this beautiful tribe of flowers will be found the most extensive and select in Europe, comprising every known variety of merit. The plants are remarkably strong and healthy, and ready for sending out to any part of the United Kingdom and the Continent at the following prices:

				£	*s*.	*d*.
12 pairs extra fine and very superior first-class Show Flowers				2	10	0
25	ditto	ditto	ditto	5	0	0
12	ditto	ditto	Show Flowers	1	10	0
25	ditto	ditto	ditto	3	0	0
12 pairs of Extra fine Show Pinks				0	12	0
25	ditto	ditto	ditto	1	1	0

The selection being left to Y. and Co.

*** For Particulars of their importation of the finest HYACINTHS, &c., direct from Haarlem, see Advertisement of last week.

Great Yarmouth Nursery, Sept. 27, 1844.

CARNATIONS AND PICOTEES.

JOHN DICKSON, Acre-lane, Brixton, Surrey, has prepared for the growers of these splendid flowers a Catalogue, enabling them to judge of their qualities, with the prices annexed, which may be had at the Nursery, and of Messrs. Warner & Warner, Cornhill, London, after the 7th September.

DOUBLE ROMAN and PAPER-WHITE NARCISSUS, 4*s*. per dozen. The above Bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have been just received at A. Cobbett's, late Mr. Barron's, Italian and Foreign Warehouse, 18, Pall Mall. Also Dutch Hyacinths, Crocus, Tulips, Anemones, &c. &c. Price Catalogues of which may be had per Post.

WOODLANDS NURSERY, Maresfield, near Uckfield, Sussex.

WM. WOOD and SON, have an immense stock of the following good and approved kinds of STRAWBERRIES, strong plants of which are now ready for immediate transit:—Myatt's British Queen, 5*s*. per 100; Eliza, 5*s*.; Elton Pine, 3*s*.; Princess Royal, fine, 7*s*. 6*d*.; Princess Alice Maud, 30*s*.; Deptford Pine, 21*s*.; Keen's Seedling, 3*s*. A remittance or reference is respectfully solicited from unknown correspondents.

Catalogues of the general Nursery Stock, and the new Rose List, are now ready, and may be had Gratis on application.

TULIPS, HYACINTHS, RANUNCULUSES, ANEMONES, GERANIUMS, AURICULAS, CARNATIONS, and LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London (removed from Walworth), by Appointment Florist to Her Majesty, begs to recommend to the attention of the Nobility, Gentry, and Public his extensive assortment of the above Flowers, which, from the success he has had in their cultivation, he can offer at very moderate prices. He particularly wishes to call attention to the highly-flattering remarks on his Exhibitions of Tulips and Lilium lancifolium this season, in the various papers. He is also desirous of reminding the Nobility, Gentry, and Amateurs, who may wish to add to their collections or ornament their parterres with these beautiful flowers, that this is the best season to make a selection. The varieties of the splendid Lilium lancifolium are particularly adapted for parterres, as, besides being quite hardy, they flower at a time when the Nobility and Gentry are at their country seats, and when flowers are so much wanted. They only require to be known to be universally cultivated. Catalogues can be forwarded by post on application. Foreign orders executed.

SPLENDID NEW PLANTS.

JAMES CUTHILL begs most respectfully to announce that he has now ready to send out strong, healthy plants of the following:—Lisianthus Russellianus, 2*s*. 6*d*. to 5*s*. each; L. nigrescens, 5*s*. to 10*s*.; L. longifolius, 5*s*. to 10*s*.; L. corymbosa, 10*s*. each; L. glaucifolius seed, at 2*s*. 6*d*. per packet. J. C. has a splendid Yellow Lisianthus which will be sent out next year. A Treatise will accompany each order on the best method of growing the Lisianthus. Fine roots of the Prince of Denmark Scarlet Clove-scented Carnation, an excellent forcer, 12*s*. per doz.; Petunia ornatissima (Van Houtte), a fine pencilled lilac, 1*s*. each; also Fleming's Trentham Cabul Melon, which gained several prizes at Regent-street—the best-flavoured and most extraordinary bearer; three lights produced 80 lbs. first crop—40 the second; and is now bearing the third; 2*s*. 6*d*. per packet. Latter's Victory of England Cucumber, 2*s*. 6*d*. per packet; Cuthill's early improved Black Spine, very handsome, 2*s*. 6*d*. per packet, or the three for 6*s*. The trade supplied by the ounce of the above Cucumbers, by sending a money order on the Camberwell Post-office.—Letters directed to J. Cuthill, Florist, Denmark-hill, Camberwell, London, will be immediately attended to.

N.B. The Lisianthus nigrescens can be seen in bloom 7 feet high, with upwards of 1000 blooms upon it, and will continue in flower till Christmas.

RAY SOCIETY, instituted 2d February, 1844.—This Society has been formed upon the principle of the Parker, Camden, Sydenham, and other Societies, for the purpose of securing to those attached to the study of Natural History, such Works on the various branches of Zoology and Botany as could not be obtained by other means; and will consist of original works; of new editions of works of established merit; of rare tracts and MSS.; and of translations and reprints of foreign works. Every subscriber of One Guinea annually will be considered a member of the Society, and will be entitled to a copy of every work published by the Society. The Council have great pleasure in stating that the number of Members already exceeds 300, and beg to call the attention of their friends to the necessity of sending in their names as early as possible, in order that they may be enabled to determine the number of copies of their works which they ought to print. The Council hope to publish two volumes before Christmas, the first of which will consist of translations from the German and Italian, of Reports on the progress of Zoology and Botany during the last few years.

Communications on the business of the Society are requested to be addressed to the Secretaries, Dr. George Johnston, Berwick-upon-Tweed, and Dr. Lankester, Golden-square, London. Subscriptions to be sent, by post-office order or check, to the Treasurer, J. S. Bowerbank, Esq., 45, Park-street, Islington.

George Johnstone, M.D. } Secretaries.
Edwin Lankester, M.D. }

J. T. WILLMER, King's Road, Chelsea, by Appointment Florist to Her Majesty, begs to inform his Friends and the Public that his Carnations and Picotees are now ready for sending out, catalogues of which may be had on prepaid application containing a postage stamp.

SPLENDID NEW HEAVY-EDGED PURPLE PICOTEE, WOOD'S "PRINCESS ALICE."

JOHN WOOD begs to announce that the stock of this superb flower is now ready for sale at 15*s*. per pair, postage included. It has gained the following prizes:—At Cambridge Florists' Show, 1843, it was the 1st seedling, and the 1st heavy-edged purple; at the same Show, in 1844, it took the premium prize, beating all the Picotees exhibited. At Huntingdon, 1843, it was 1st seedling and 1st purple Picotee; at the same place, 1844, it was 1st, 2d, 3d, and 4th, excluding every other flower. At Peterborough, 1843, it was the 1st seedling, took 1st pair of purple, and was in the best stand of six Picotees; in 1844, at the same Show, it took the 1st pair, and was again in the 1st stand of six.

J. W. flatters himself that this statement precludes the necessity of farther comment. Plants of the above may also be had of Hurst and M'Mullen, 6, Leadenhall-street.

J. W. has a few pairs of that splendid Pink, Garratt's "Queen of Roses," for sale, at 7*s*. 6*d*. per pair; his Catalogue of Carnations, Picotees, &c., may also be had on prepaid application; and those about to commence growing, he will supply as follows, if left to his selection.

CARNATIONS AND PICOTEES.

		£	*s*.	*d*.
50 pairs good sorts, one pair of each		3	0	0

Also the following, in collections:

100 Cape Ericas of 100 distinct sorts, (including many fine sorts) 5*l*.
12 Epacrises of 12 distinct sorts, (including Campanulata rosea) 21*s*.
12 Azalea indica, of 12 distinct sorts, (including fulgens) 21*s*.

Thomas Jackson, Kingston Nursery, Surrey, Sept. 27.

JOHN SLATER, Florist, Cheetham Hill, near Manchester, respectfully calls the attention of the Floricultural Public to his large and select collection of the following Florists' Flowers:—TULIPS, AURICULAS, POLYANTHUSES, CARNATIONS, and PICOTEES; catalogues of which may be had on prepaid application. 12 plants of named Auriculas, of different varieties, for 20*s*., package included. 20 pairs of Carnations and Picotees, good named varieties, for 20*s*., package included.

LILIUM LANCIFOLIUM. — Flowering Bulbs of these most beautiful LILIES to be had at the following low prices:

Lancifolium	album	5*s*.	each.
,,	punctatum	5*s*.	,,
,,	speciosum	25*s*.	,,

of W. J. Nutting, Seedsman, 46, Cheapside, London.

Seed from the best varieties of IXIAS and SPARAXIS, at 2*s*.6*d*. per packet.

NEW CARNATIONS, PICOTEES, AND PINKS.

MESSRS. N. and B. NORMAN'S CATALOGUE of SHOW VARIETIES can be had on prepaid application.—Bull Fields, Woolwich.

DUTCH FLOWER-ROOTS, &c.

DICKSONS AND Co., NURSERY, SEEDSMEN, and FLORISTS, Waterloo-place, Edinburgh, in returning thanks for the long-continued patronage of their numerous Friends and the Public, respectfully intimate the arrival of their second importation of BULBOUS FLOWER-ROOTS, consisting of a superb collection of double and single Hyacinths, of every variety and shade of colour; Polyanthus and other Narcissus; double and single Duc Van Thol, new Forcing, and Florists' Tulips; Amaryllis; Crown Imperials and Martagon Lilies; Gladiolus, with many new hybrids; Iris, Ixias, Spiraxis, Scillas, Oxalis, Tigridias, Jonquils, Fritillarias, Snowdrops, Crocuses, Anemones, Ranunculuses, Tuberoses, Alstrœmerias, Gesnerias, Gloxinias, Tropæolums, &c., all carefully selected, of very superior growth, and moderate in price.

They are in course of receiving their usual supply of early Garden Seeds, Winter Tares, &c., for autumn-sowing.

D. & Co. would, this season, invite particular attention to the following, at their extensive Nurseries, Leith Walk, Pilrig-street, and Red Braes:—Seedling and transplanted Forest-trees of every variety; Thorns and Plants for Hedges and Underwood (samples of which will be forwarded when required); trained and standard Fruit-trees, extra fine; newest French, China, and Hybrid Roses; Evergreen and Deciduous Flowering Shrubs; Greenhouse, Stove, and Flower-garden Plants.

Early orders are invited for D. & Co.'s Prize Seedling CALCEOLARIAS, so much in demand, and which will be sent out for the first time, during autumn and spring. The names are—

Beauty Supreme	Duke of Argyll	Nestor
Captivation	Earl of Eglinton	Nymph
Clara	Earl of Seafield	Prince Albert
Comet	Excelsa	Panther
Competitor	Exquisite	Queen of Roses
Constellation	Favourite	Rebecca
Curate	Flash	Sir Robert Peel
Dictator	Jessie	Sir Walter Scott
Duchess of Gordon	Lord Lovat	Splendida
Dchss. of Roxburghe	Luna	Sultan
Duke of York	Marquis of Bute	Triumph
Duke of Wellington	Mrs. Morrison	Village Maid
Duke of Roxburghe	Miss Milne	

MARCHIONESS OF BREADALBANE, white ground, finely marbled with rose pink, and splendid form.

ECLIPSE (RICHARDSON'S), very superior to Standishii, with fine habit, and very distinct flower.

NE PLUS ULTRA (SHANKLIE'S), rose colour, beautifully spotted with crimson, and splendid form.

LEITH WALK BEAUTY (SHANKLIE'S), pure yellow ground, beautifully striped and spotted with scarlet, with large and fine form.

GEM (SCOTT'S), white ground, richly spotted and striped with crimson, very superior to similar one called Duchess of Buccleuch.

STANDARD OF PERFECTION (FERGUSON'S), cream colour, very distinctly marked all over with maroon and rose-coloured spots, with peculiarly perfect form.

DUKE OF BUCCLEUCH, large white ground, with fine large purple blotch, superior to Lucy.

MRS. RICHARDSON, beautiful cream-coloured ground, richly spotted and striped with rosy crimson, splendid habit.

QUEEN, light straw-coloured ground, striped and shaded with maroon, curiously marked, and very showy.

LADY ANN MURRAY, white ground, belted and spotted with purplish pink, large and fine form.

PRICE of single Plants of those described above, 15*s.* each.
Those not described . . . . . 10*s.* 6*d.* each.
If taken in collections, as follows:—

Six of the very best	£2 2*s.*
Twelve do. do.	3 3
Eighteen do. do.	4 4

DICKSONS and Co. will be glad to communicate with Noblemen or Gentlemen requiring Gardeners, Farm Stewards, Foresters, &c., as they have on their list men of very superior character and ability.—1, Waterloo-place, Edinburgh, Sept. 1844.

NEW PLANTS.

MESSRS. VEITCH AND SON have now ready for sending out the two undermentioned beautiful New Plants, viz.:—

HINDSIA VIOLACEA. Strong plants at 63*s.* It is figured by Dr. LINDLEY, in the "Botanical Register" for August last, who there says—"The Hindsia violacea is one of the finest things obtained from South Brazil. It has been imported by Messrs. Veitch and Son, of Exeter, who received for it the Large Silver Medal at the Horticultural Society's Garden Exhibition in May last. It will doubtless prove a very easily cultivated Greenhouse Plant; and is certainly unsurpassed in beauty by blue-flowering shrubs."

CLITORIA PULGENS. Strong plants at 42*s.* This plant was exhibited at Chiswick, in May, under the name of Centrosema species, and received the Knightian Medal. See Report in *Gardeners' Chronicle* for May 25. It is figured in "Paxton's Magazine" for July last.

Messrs. V. and Son have also to offer the following fine plants, viz.:—

Achimenes picta	Gardenia Sherbournea
Allemanda grandiflora	,, tetrasperma
Barbacena squamata Veitchia	Gesneria polyantha
Clerodendron lævifolium	Gloxinia Cartonii
,, splendens	Hindsia longifl ra
Cyrtoceras reflexa	Inga pulcherrima
Echites atropurpurea	Luxemburgia ciliosa
,, hirsuta	Passiflora actinea
,, splendens	Pentas carnea
Gardenia Rothmannia	Thunbergia chrysops, &c. &c.

N.B.—Messrs. V. and Son's General Catalogue can be had on application.—Exeter, Sept. 27, 1844.

ROSES.

A. PAUL AND SON respectfully announce that their Annual Descriptive ROSE CATALOGUE will be ready for circulation in a few days, and may be obtained from the Nurseries post-free, upon application inclosing two postage stamps. Their stock is very large, and having been grown on new ground, the plants are more than usually robust and healthy. All the really valuable new Roses are in their collection.

TO NOBLEMEN and GENTLEMEN PLANTING.—A. PAUL and SON would also call attention to their Fruit and Forest Trees, Ornamental Trees, Shrubs, Evergreens, &c. &c., which are growing on upwards of 25 acres of ground, and are on sale upon the most reasonable terms. The soil is a stiff loam, from which Trees remove in perfect safety, having abundance of fibrous roots, and the earth adhering thereto. The proximity of the Nurseries to the Metropolis, and the advantageous terms of sale, recommend them especially to gentlemen planting.

Nurseries, Cheshunt, Herts, 13 miles from London, near the Waltham Cross Station on the Cambridge Line of the Eastern Counties Railway.

EARLIEST STRAWBERRY in CULTIVATION.—Strong Plants of the "PRINCESS ALICE MAUDE" STRAWBERRY, which has proved itself to be the earliest grown in this country, are now ready to be sent out at 30*s.* per 100. As an Early Strawberry, it has taken the First Prize at all the Horticultural Exhibitions in the early part of the season. Also Plants of the "British Queen," "Deptford Pine," "Prince Albert," and all the leading kinds. To be had of Messrs. WARNER & WARNER, Seedsmen, 28, Cornhill, London.

CAMELLIA JAPONICA.

ROBERT LAWSON, Esq., of Tiverton, intends disposing of his stock of Camellias, which he has collected at much expense, and successfully cultivated for many years. They are in the highest state of health, and most abundantly set with blooming buds. Mr. L. disposes of them solely in consequence of their having become too large for his conservatory. They are as follow:—

			£	*s.*	*d.*
Reticulata,	from 7 to 8 feet in height,	a very fine specimen, quite healthy and green	10	10	0
Imbricata,	from 7 to 8 feet in height,	do. .	8	8	0
,,	,, 3 to 4 ,,	. . .	1	10	0

Ivery's Pet, 1*s.* 6*d.* to 2*s.* 6*d.*; Magna Charta, 1*s.* 6*d.* to 2*s.* 6*d.*; Reliance, 1*s.* 6*d.* to 2*s.* 6*d.*; Ovid, 1*s.* 6*d.*; Prince Albert, 1*s.* 6*d.* to 2*s.* 6*d.*; Kentish Beauty, 1*s.* 6*d.*; Enchantress, 1*s.*

JOSEPH FRYER begs respectfully to inform his Friends and the Public, that he will have ready in a few days Catalogues containing his choice and extensive Collection of PANSIES, VERBENAS, FUCHSIAS, PETUNIAS, CARNATIONS, PICOTEES, PINKS, Greenhouse and Herbaceous Plants, &c. &c., likewise a separate Catalogue of Dutch Bulbous Roots, which will be forwarded on application. J. F. begs to observe that his plants are in excellent health, true to name and at very low prices.—Clarendon Nursery, Camberwell, London, Sept. 27.

PARKSTONE NURSERY, NEAR POOLE.

J. PIPER'S NEW SEEDLING FUCHSIA, PICTA.—This flower has been submitted to Professor LINDLEY for inspection, and has been pronounced by him to be a good flower. It is large in size, the tube and sepals of a delicate but bright pink, the latter tipped with green; the corolla of a rich rosy crimson, slightly tinged with lilac. The flower is well developed, and of admirable form and substance. It is altogether a most desirable variety, and ought to be in the collection of every cultivator of this beautiful tribe.

LARGE DOUBLE WHITE ROCKETS.

S. AND J. DILLISTONE have a fine stock of the above, which will be sold reasonable. Also some strong SEEDLING CINERARIAS, from the choicest named ones of last season. Prices, &c. upon application.—Nurseries, Sturmere, Essex, near Haverhill.

CRAIG'S PROLIFIC FORCING CUCUMBER.—This unrivalled variety for Early Forcing in Pots, Boxes, or Frames, is now ready for distribution, and may be had per post at 2*s.* 6*d.* per packet of six seeds. For supplying a family this variety is unequalled, being a cross between the Sion House Frame and Smyrna, and combines the good properties of both its parents. Apply to Mr. Edwards, Seedsman, Bridge-street, York; to Mr. Geo. Charlwood, Seedsman, Covent-garden; to Messrs. Flanagan and Son, Mansion-house-square, London; or to J. CRAIG (the raiser), Sand Hutton, near York. 2*s.* 6*d.*, or the amount in postage stamps, will be required.

N.B.—The most respectable reference as to its superiority given on application.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

THE following Articles, manufactured in Slate for Horticultural purposes, may be seen in use at Worton Cottage, upon application to the gardener (Sundays excepted).

Tank Covers	Bottoms for Frames
Cisterns	Boxes for Balconies and Verandahs
Shelves	Orange Tubs, Flower Boxes, &c.
Garden Edging	

EDWARD BECK will be happy to answer any inquiries, either personally or by post.

SUPERB HYACINTHS, ANEMONES, TULIPS, &c.,

just received from the most celebrated growers in Holland, and will be delivered free of all expenses at the railways, packet-offices, or in any part of London, at the very moderate prices annexed.

Messrs. SUTTON and SONS, Reading, Berks, respectfully present the above as a select list of the sorts most worthy of cultivation, and recommend early application, while they possess fine roots of every variety.

N.B.—Parcels delivered free to any part of London, and properly packed for conveyance to any distance.

Sales by Auction.

TO GENTLEMEN, BUILDERS, NURSERYMEN, & OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed to Sell by Public Auction (under a bill of sale), on the premises, Sussex Nursery, Loughboro'-road, Brixton-road, on Monday, 30th September, 1844, at eleven o'clock, the whole of the NURSERY STOCK, consisting in choice Evergreens and Flowering Shrubs, Standard and Dwarf Roses; also two newly-erected Greenhouses, Frames, about 2000 Greenhouse Plants, a quantity of Rock Work, Utensils in Trade, &c., may be viewed prior to the sale. Catalogues may be had on the premises, of the principal Seedsmen, and of the Auctioneers, Leytonstone.

FREEHOLD NURSERY-GROUND, ST. ALBAN'S, HERTS.

MESSRS. PROTHEROE & MORRIS have received instructions from the Executors of the late Mr. Robert Fullwood, the mortgagee, to submit to public competition at the Auction Mart, Bartholomew-lane, on Thursday, 3d October, 1844, at One o'clock, THE KEY FIELD NURSERY AND NURSERY PREMISES, adjoining the town of St. Alban's, comprising a comfortable and convenient Dwelling-house and Shop, fronting the High Road from St. Alban's to London, and about six acres of very productive Nursery and Garden Ground. The whole Freehold and Land-Tax redeemed, and immediate possession may be had. The Premises were late in the occupation of Mr. David Watson, who for many years and up to the period of his death carried on the business of a Nursery and Seedsman. May be viewed at any time, and particulars had at the principal Inns in the neighbourhood, at the Auction Mart, of J. S. Story, Esq., Solicitor, St. Alban's; of George Drew, Esq., 185, Bermondsey-street, Borough; and of the Auctioneers, Leytonstone, Essex.

BUNNEY'S FINAL SALE.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by the Proprietor (in consequence of the Lease having expired), to submit to Public Competition by Auction, on the Premises, Kingsland Nursery, Balls Pond-road, on MONDAY, Oct. 7, 1844, and following days, at Eleven o'Clock each day without reserve, the whole of the valuable NURSERY STOCK, consisting of FRUIT and FOREST-TREES, a considerable quantity of EVERGREENS, AMERICAN PLANTS, STOOLS, &c. The Stock is particularly worthy the attention of Noblemen and Gentlemen laying out their Grounds; also the Trade, from its excellence, and comprising an excellent collection of Ghent AZALEAS, MAGNOLIAS, RHODODENDRONS, &c. May be viewed prior to Sale. Catalogues may be had on the Premises, of the principal Seedsmen, and of the Auctioneers, Leytonstone.

ISLINGTON NURSERY.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, and Others.

MESSRS. PROTHEROE AND MORRIS are instructed by the Proprietor to submit to Public Competition, on MONDAY, 14th October, 1844, and 2 following days, at 11 o'clock, (in consequence of the ground being required for building,) a portion of the valuable NURSERY STOCK, consisting of about five thousand Belgian Azaleas, in 40 fine varieties; several thousands fine Hybrid Rhododendrons, well furnished with bloom buds; Green and Var. Hollies, Chinese and Siberian Arborvitæ, about five thousand Laurels, with a fine assortment of Fruit and Forest Trees, Flowering Shrubs, &c.

May be viewed prior to the Sale. Catalogues may be had on the Premises; of the principal Seedsmen; and of the Auctioneers, American Nursery, Leytonstone.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. FRANKLIN (in consequence of his Lease having expired and the ground let for building) to submit to Public Competition, on the Premises, Cottage-place, City Road, on THURSDAY, October 17th, 1844, at 11 o'clock, the whole of his VALUBLE STOCK, consisting of named Seedling Tulips, Auriculas, Carnations, Picotees, and Pinks, Greenhouse and Herbaceous Plants; a capital Greenhouse, 20 ft. by 11 ft.; and sundry Effects. May be viewed prior to sale. Catalogues may be had on the Premises; of the principal Seedsmen; and of the Auctioneers, Leytonstone.

GERANIUM "CELESTIAL."

CHANDLER AND SONS, NURSERYMEN, Vauxhall, London, have now ready to send out young plants of their New Geranium "CELESTIAL," which has been so much admired. The flowers being very large, and with a beautiful white throat, it is one of the most conspicuous varieties that has yet been raised. Plants, 10*s.* 6*d.* each.

C. and Sons have also to offer healthy young plants of CAMELLIAS of sorts, with flower-buds, at 30*s.* per dozen; larger plants 42*s.* per dozen; and good plants of the newer sorts 60*s.* per dozen. Also good plants of the best sorts of CHRYSANTHEMUMS, at 12*s.* per dozen; larger plants, 18*s.* per dozen. The package included in the above prices. A remittance or reference for payment in London will be expected from unknown correspondents.

WOODLANDS NURSERY, Maresfield, near Uckfield, Sussex. WM. WOOD AND SON have the pleasure of offering the following choice CAMELLIAS, which are chiefly strong plants abundantly furnished with bloom-buds. They also beg to inform Amateurs who are desirous of purchasing Camellias for flowering this season, that they will now bear the transit better than when the buds are in a more advanced state.

The Gardeners' Chronicle.

SATURDAY, SEPTEMBER 28, 1844.

MEETINGS FOR THE FOLLOWING WEEK.

TUESDAY,	Oct. 1	Horticultural	3 P.M.
FRIDAY,	Oct. 4	Botanical	8 P.M.

ANY improvement that can be effected in the quality of POTATOES is important. Some observations on the subject, at this season of the year, may possibly therefore have a useful tendency.

It is well known that in some soils, and in most seasons, the produce of Potatoes is abundant and their quality excellent; while in others, the quantity is not deficient, but the quality is inferior; and there are situations so unfavourable, that the crop is always bad in every respect. Occasionally, indeed, cold wet seasons deteriorate this important crop, even in the best soil on which the most skilful cultivation has been bestowed. Supposing, however, that all has been done which could possibly be effected in the way of good cultivation, yet, when the crop is fit for taking up, its proper after-management is a most important consideration.

People think that if they guard their crop from frost, they have done all that can be needed; but this is a mistake of the worst kind. By improper management after taking up, Potatoes of the finest quality are easily spoiled; and, on the contrary, by judicious treatment, even such as are watery may be much improved. It is of the first consequence that light as well as frost should be guarded against, for light renders the tubers unwholesome, and that in proportion to its intensity and the length of time the tubers are exposed to its influence.

The stems, and in fact all the parts of the Potato-plant above ground are more or less poisonous. Tubers are occasionally formed along the stem, but they are, as we all know, green and bad. This is entirely owing to their exposure to light; for had the stems been laid in the earth, so as to have covered such stem-tubers from the commencement of their growth, they would have been just as good as the tubers of the usual underground formation. On the contrary, tubers naturally produced from a part of the stem below the surface, although they may be of various colours outwardly, are blanched internally, unless they grow themselves out of the soil. In that case they acquire a green tinge throughout, and with it a quality bad, like that of the spurious tubers produced in full daylight on the stem above ground.

It is, fortunately, not much the practice now; but formerly in towns, and in London particularly, large heaps of washed Potatoes were to be seen exposed for sale and to the action of light, and in some situations, occasionally to the direct rays of the sun. Potatoes, even in their dirty state, as taken up, will be considerably altered in colour, both externally and internally, and proportionably impaired in quality by a few days' exposure to light in clear weather, although they may not be exposed to the sun's direct rays; but the effect must be much greater when the surface is washed and deprived of the partial shade afforded by the particles of soil.

On the part of the vendors, it may be argued that exposure is necessary for sale; but this argument would soon fall to the ground were purchasers aware that, all other circumstances being the same, Potatoes which have suffered the least possible exposure are the best for food, and *vice versâ*.
